There is no evidence of any profession of Christianity on the part of the Gur Khán, though it is a fact that the daughter of the last of his race is recorded to have been a Christian. The hosts of the Gur Khán are called by Moslem historians *Al-Turk-al-Kuffár*, the kafir or infidel Turks; and we know that in later days the use of this term "kafir" often led to misapprehensions, as when Vasco da Gama's people were led to take for Christians the Banyan traders on the African coast, and to describe as Christian sovereigns so many princes of the farther East of whom they heard at Calicut. Of the rest of the accretions to the story little can be said except that they are of the kind sure to have grown up in some shape when once the Christianity of the conqueror was assumed. We have said that Prester John was a phantom; and we know out of what disproportionate elements phantoms are developed. How the name John arose is one of the obscure points. Oppert supposes the title "Gur

Khán" to have been confounded with Yukhanan or Johannes; and of course it is probable that even in the Levant the stories of "John the patriarch of the Indies," repeated in the early part of this article, may have already mingled with the rumors from the East.

The obvious failure in the history of the Gur Khán to meet all points in the story of the bishop of Gabala led Professor Bruun of Odessa to bring forward another candidate for identity with the original Prester John, in the person of the Georgian prince John Orbelian, the "sbasalar," or generalissimo under several kings of Georgia in that age. Space forbids our stating all the ingenious arguments and coincidences with which Professor Bruun supported his theory. Among other arguments he does show some instances, in documents of the 15th century, of the association of Prester John with the Caucasus. In one at least of these the title is applied to the king of Abassia, i.e., of the Abhasians of Caucasus. Some confusion between Abash (Abyssinia) and Abbas seems to be possibly at the bottom of the imbroglío. An abstract of Professor Bruun's argument will be found in the second edition of *Marco Polo*, vol. ii. pp. 539-542. We may quote here the conclusion arrived at in winding up that abstract. "Professor Bruun's thesis seems to me more than fairly successful in paving the way for the introduction of a Caucasian Prester John; the barriers are removed, the carpets are spread, the trumpets sound royally,—but the conquering hero comes not. He does very nearly come. The almost royal power and splendor of the Orbelians at this time is on record. . . . (see St. Martin, *Mém. sur l'Arménie*, ii. 77) . . . Orpel Ivane, i.e., John Orbelian, Grand Sbasalar, was for years the pride of Georgia, and the hammer of the Turks. . . . But still we hear of no actual conflict with the chief princes of the Seljukian house, and of no event in his history so important as to account for his being made to play the part of *Presbyter Johannes* in the story of the Bishop of Gabala." As regards any real foundation for the title of "Presbyter" we may observe that nothing worth mentioning has been alleged on behalf of any candidate.

When the Mongol conquests threw Asia open to Frank travellers in the middle of the 13th century their minds were full of Prester John; they sought in vain for an adequate representative, nor was it in the nature of things that they should not find some representative. In fact they found several. Apparently no real tradition existed among the Eastern Christians of such a personage; the myth had taken shape from the clouds of rumor as they rolled westward from Asia. But the persistent demand produced a supply; and the honor of identification with Prester John, after hovering over one head and another, settled for a long time upon that of the king of the Nestorian tribe of Kerait, famous in the histories of Jenghiz under the name of Ung or Awang Khán. We may quote an illustration from geographical analogy: "Pre-Columbian maps of the Atlantic showed an island of Brazil, an island of Antillia, founded—who knew on what?—whether on the real adventure of a vessel driven in sight of the Azores or Bermudas, or on mere fancy and fogbank. But when discovery really came to be undertaken, men looked for such lands and found them accordingly. And there they are in our geographies, Brazil and the Antilles."¹

In Plano Carpini's (1248) single mention of Prester John as the king of the Christians of India the Greater, who defeats the Tartars by an elaborate stratagem, Oppert recognizes Jaláluddín of Khwarezm and his brief success over the Mongols in Afghanistan. In the Armenian prince Sempad's account (1248), on the other hand, this Christian king of India is aided by the Tartars to defeat and harass the Saracens, and becomes the vassal of the Mongols. In the narrative of William Rubruquis (1253), though distinct reference is made to the conquering Gur Khán under the name of Coir Cham of Caracaty, the title of "King John" is assigned to Kushluk, king of the Naimans, who had married the daughter of the last lineal representative of the gur kháns.² And from the remarks which Rubruquis makes in connection with this King John, on the habit of the Nestorians to spin wonderful stories out of nothing, and of the great tales that went forth about King John, it is evident that the intelligent traveller supposed this king of the Naimans to be the original of the widely-spread legend. He mentions, however, a brother of this John called Unc who ruled over the Crit and Merkit (or Kerait and Mekrit,

two of the great tribes of Mongolia); whose history he associates with that of Jenghiz Khán. Unc Khán reappears in Marco Polo, who tells much about him as "a great prince, the same that we call Prester John, him in fact about whose great dominion all the world talks." This Unc was in fact the prince of the Kerait, called by the Chinese Tuli, and by the Persian historians of the Mongols Toghral, on whom the Kin emperor of north China had conferred the title of "wang" or king, whence his coming to be known as Awang or Ung Khán. He was long the ally of Jenghiz, but a breach occurred between them, and they were mortal enemies till the death of Ung Khán in 1203. In the narrative of Marco Polo "Unc Can," alias Prester John, is the liege lord of the Tartars, to whom they paid tribute until Jenghiz arose. And this is substantially the story repeated by other European writers of the end of the 13th century, such as Ricold of Montecroce and the Sieur de Joinville, as well as by one Asiatic, the famous Christian writer, Gregory Albufaraj. We can find no Oriental corroboration of the claims of Ung Khán to supremacy over the Mongols. But that his power and dignity were considerable appears from the term "Pádsháh," which is applied to him by the historian Rashíduddín.

We find Prester John in one more phase before he vanishes from Asiatic history, real or mythical. Marco Polo in the latter part of the 13th century, and Friar John of Montecorvino, afterwards archbishop of Cambaluc, in the beginning of the 14th, speak of the descendants of Prester John as holding territory under the great khán in a locality which can be identified with the plain of Kuku-Khotan, north of the great bend of the Yellow River and about 280 miles northwest of Peking. The prince reigning in the time of these two writers was named King George, and was the "6th in descent from Prester John," i.e., no doubt from Awang Khán. Friar Odoric, about 1326, visited the country still ruled by the prince whom he calls Prester John; "but," he says, "as regards him, not one hundredth part is true that is told of him." With this mention Prester John ceases to have any pretension to historical existence in Asia (for we need not turn aside to Mandeville's fabulous revival of old stories or to the barefaced fictions of his contemporary, John of Hese, which bring in the old tales of the miraculous body of St. Thomas), and his connection with that quarter of the world gradually died out of the memory of Europe.³

When next we begin to hear his name it is as an African, not as an Asiatic prince; and the personage so styled is in fact the Christian king of Abyssinia. The learned Ludolf has asserted that this application was an invention of the Portuguese and arose only in the 15th century. But this is a mistake; for in fact the application had begun much earlier, and probably long before the name had ceased to be attached by writers on Asia to the descendants of the king of the Kerait. It is true that Simon Sigoli, who visited Cairo in 1384, still speaks of "Presto Giovanni" as a monarch dwelling in India; but it is the India which is contemporary with the dominions of the sultan of Egypt, and whose lord is master of the Nile, to close or open its discharge upon Egypt.⁴ Thirty years earlier (c. 1352) John Marignolli speaks of Ethiopia where the Negroes are, and which is called the land of Prester John.⁵ Going back still farther, Friar Jordanus, who returned from the East before 1328, speaks of the emperor of the Ethiopians "quem vos vocatis *Prestre Johan*."

But, indeed, we shall have strong probability on our side if we go back much farther still, and say that, however vague may have been the ideas of Pope Alexander III. respecting the geographical position of the potentate whom he addressed from Venice in 1177, the only real person to whom the letter can have been sent was the king of Abyssinia.

³ The stories of Khitái as a Christian empire, which led the Jesuits at the Court of Akbar to despatch Benedict Goes in search of it (1601), did, however, suggest to Jerome Xavier, their chief, that the country in question "was the Cathay of Marco Polo, and its Christian king the representative of the famous Prester John"—a jumble of inaccuracy.

⁴ So Ariosto—

"Si dice che 'l Soldan Re dell' Egitto
A quel Re dà tributo e stà soggetto,
Perch'è in poter di lui dal cammin dritto
Levarè il Nilo e dargli altro ricetto,
E per questo lascià subito affitto
Di fame il Cairo e tutto quel distretto.
Senapo detto è dai suddetti suoi:
Gli diciam Presto o Prete Ianni noi."

⁵ In a Spanish work of about the same date, by an anonymous Franciscan, we are told that the emperor called "Abdeselibi, which means 'servant of the Cross,' is a protector of *Preste Juan*, who is the patriarch of Nubia and Ethiopia, and is lord of many great lands, and many cities of Christians, though they be black as pitch, and brand themselves with the sign of the cross in token of their baptism" (*Libro del conocimiento de todos reynos*, etc., printed at Madrid, 1877).

¹ App. to *Marco Polo*, 2d ed., ii. 543.

² It has been pointed out by Mr. Alexander Wylie that Kushluk was son of a powerful king of the Naimans, whose name Ta-Yang-Khán is precisely "Great King John" as nearly as that could be expressed in Chinese.

sinia. Let it be observed that the "honorable persons of the monarch's kingdom" whom the leech Philip had met with in the East must have been the representatives of some real power, and not of a phantom. It must have been a real king and not a rumor-begotten ignis fatuus who professed to desire reconciliation with the Catholic Church and the assignation of a church at Rome and of an altar at Jerusalem. Moreover, we know that the Ethiopic Church did long possess a chapel and altar in the Church of the Holy Sepulchre, and, though we have been unable to find travellers' testimony to this older than about 1497, it is quite possible that the appropriation may have originated much earlier.¹ We know from Marco Polo that about a century after the date of Pope Alexander's epistle a mission was sent by the king of Abyssinia to Jerusalem to make offerings on his part at the Church of the Sepulchre. It must be remembered that at the time of the pope's letter Jerusalem, which had been taken from the Moslem in 1099, was still in Christian possession. Abyssinia had been going through a long period of vicissitude and distraction. In the 10th century the royal line had been superseded by a dynasty of Falasha Jews, followed by other Christian families; but weakness and disorder continued till the restoration of the "House of Solomon" (c. 1268). Nothing is more likely than that the princes of the "Christian families" who had got possession of the throne of northern Abyssinia should have wished to strengthen themselves by a connection with European Christendom, and to establish relations with Jerusalem, then in Christian hands. We do not know whether the leech Philip ever reached his destination, or whether a reply ever came back to the Lateran.²

Baronius, who takes the view for which we have been arguing, supposes it possible that the church in Rome possessed in his own time by the Abyssinians (St. Stephen's in the Vatican) might have been granted on this occasion. But we may be sure that this was a modern concession during the attempts to master the Ethiopian Church early in the 16th century. Ludolf intimates that its occupancy had been taken from them in his own time after it had been held "for more than a century."

In the legendary history of the *Translation of the Three Blessed Kings* by John of Hildesheim (c. 1370), of which an account and extracts are given by Zarncke (*Abhandl.* ii., 154 sq.), we have an evident jumble in the writer's mind between the Asiatic and the African location of Prester John; among other matters it is stated that Prester John and the Nubians dug a chapel out of the rock under Calvary in honor of the three kings: "et vocatur illa capella in partibus illis capella Nubiyanorum ad reges in presentem diem, sed Sarracini . . . ob invidiam obstruxerunt (p. 153)."

There is no need to proceed further. From the 14th century onwards Prester John had found his seat in Abyssinia. It is there that Fra Mauro's great map (1459) presents a fine city with the rubric, "Qui il Preste Janni fa residentia principal." When, nearer the end of the century (1481-95), King John II. of Portugal was prosecuting inquiries regarding access to India his first object was to open communication with "Prester John of the Indies," who was understood to be a Christian potentate in Africa, and regarding whom information was sought "through Abyssinian monks who visited these Spanish regions, and also

through certain friars who went from this country to Jerusalem." And when Vasco da Gama went on his memorable voyage from Mozambique northwards he began to hear of "Preste Joham" as reigning in the interior,—or rather, probably, by the light of his preconceptions of the existence of that personage in east Africa he thus interpreted what was told him. More than twenty years later, when the first book on Abyssinia was composed—that of Alvarez—the title, constantly and as a matter of course designating the king of Abyssinia, is "Prester John," or simply "the Preste." The name occurs on almost every page of the narrative beginning with page 1, though in the translation printed for the Hakluyt Society that which the editor calls "general index" gives no indication of the fact.

The name of "Prester John" suggested alike to scholars and sciolists, first in its Oriental and then in its Ethiopian connection, many fanciful and strained etymologies, from Persian, Hebrew, Ethiopic, and what not, and on the assumption that neither "Presbyter" nor "John" was any proper element of the name. But for these dreams this passing notice must suffice.

On the whole subject in its older aspects, see Ludolf's *Historia Ethiopiae* and its *Commentary*, *passim*. The excellent remarks of M. d'Avezac, comprising a conspectus of almost the whole essence of the subject, are in the *Recueil de voyages et de Mémoires*, published by the Société de Géographie, vol. iv., Paris, 1839, pp. 547-564. Two German works of importance which have been used in this article are the interesting and suggestive *Der Presbyter Johannes in Sage und Geschichte*, by Dr. Gustav Oppert (2d. ed., Berlin, 1870), and, most important of all in its learned, careful, and critical collection and discussion of all the passages bearing on the subject, *Der Priester Johannes*, by Friedrich Zarncke of Leipsic (1876-79), still unfortunately unfinished, and without the summing up which is required to complete the subject. The present writer has given considerable attention to the subject, and discussed it partially in *Cathay and the Way Thither*, p. 173 sq., and in *Marco Polo*, 2d. ed., i. 229-233, ii. 539-543. (H. V.)

PRESTON, a market-town and municipal and parliamentary borough of Lancashire, is situated on the north bank of the Ribble, on the Lancaster Canal, and at the junction of several railway lines, 28 miles north-east of Liverpool and 31 northwest of Manchester. It consists chiefly of one long street, running from east to west along a steep ridge above the Ribble, which is crossed by six bridges, three of which are railway bridges. The parish church of St. John, rebuilt in 1855 in the Decorated style, occupies the site of a very ancient structure. A large number of ecclesiastical parishes have been formed within recent years, but none of the churches possess special architectural features. The Catholic church of St. Walpurgis or St. Walpurg is an elaborate structure in the Early Decorated style, erected in 1854, and since then extensively altered. There are several good public buildings, including the town-hall (1867 in the Early Gothic style, from designs by Sir Gilbert Scott), the prison (1789), the corn exchange and market-house (1824), the court-house (1829), the borough magistrates' court (1858), the covered market (1870), the county offices (1882), the public baths, and the barracks. The most important public institution is the free public library and museum, established in 1879. The building was erected, from designs by Mr. J. Hibbert, at a cost of £75,000 [\$364,500] by the trustees of Mr. E. R. Harris, whose name it bears, a further sum of £30,000 [\$145,800] being appropriated by them to furnish and endow the library and museum, which are to be maintained in efficiency forever by the corporation. This body gave the site in the principal market-place at a cost of £30,000 [\$145,800]. Here is placed Dr. Shepherd's library, founded in 1761, of nearly 9000 volumes, as well as a collection of pictures, etc., valued at £40,000 [\$194,400], bequeathed by Mr. R. Newsham. The Harris Institute, endowed by the above-named trustees with £40,000 [\$194,400], is established in a building of classical style erected in 1849, wherein are held science and art classes, and where is placed a thoroughly equipped chemical laboratory. For the grammar-school, founded in 1550, a building in the Tudor style was erected in 1841 by private shareholders, but in 1860 they sold it to the corporation, who now have the management of the school. The blue-coat school, founded in 1701, was in 1817 amalgamated with the national schools. Preston is well supplied with

¹ Indeed, we can carry the date back half a century further by the evidence of a letter translated in Ludolf (*Comment.*, p. 303). This is addressed from Shoa by the king Zara Jacob in the eighth year of his reign (1442) to the Abyssinian monks, dwellers at Jerusalem. The king desires them to light certain lamps in the Church of the Sepulchre, including "three in our chapel." In the *Pilgerfahrt des Ritters Arnold von Harff* (1496-99), Cologne, 1860, p. 175, we find it stated that the Abyssinians had their chapel, etc., to the left of the Holy Sepulchre, between two pillars of the temple, whilst the Armenian chapel was over theirs, reached by a stone staircase alongside of the Indians (or Abyssinians). This exactly corresponds with the plan and references given in Sandys's *Travels* (1615, p. 162), which shows the different chapels. The first on the south, i.e., the left looking from the body of the church, is "No. 35.—The chappell of the Absinies, over which the chappell of the Armenians." A reference to Jerusalem, which we procured through the kindness of Mr. Walter Besant, shows that the Abyssinians no longer have a chapel or privileges in the Church of the Sepulchre. Between the Armenians and the Copts they have been deprived of these, and even of the keys of their convent. The resentment of King Theodore at the loss of these privileges was one of the indirect causes which led to the war between him and England in 1867-68.

² Matthew Paris gives a letter from Philip, prior of the Dominicans in Palestine, which reached the pope in 1237, and which speaks of a prelate from whom he had received several letters, "qui preest omnibus quos Nestoriana hæresis ab ecclesia separavit (cujus prelati per Indiam Majorem, et per regnum sacerdotis Johannis, et per regna magis proxima Orienti dilatatur)." We have little doubt that Abyssinia was the "regnum" here indicated, though it was a mistake to identify the Abyssinian Church with the Nestorians.

public recreation grounds, including Avenham Park, the Miller Park with a statue of the 14th earl of Derby, and the Moor Park. Winckley Square, near the centre of the town, has a monument to Sir Robert Peel.

Formerly "proud" Preston was a place of "fashion and society"; but the introduction of the linen manufacture at the end of the 18th century completely altered its character. The inventions of Sir Richard Arkwright, who was a native of the town, found in Preston early acceptance; and owing to its convenient communications by river, canal, and railway, aided by native enterprise, it has become one of the principal seats of the cotton manufacture in Lancashire.

Plan of Preston.

There are also iron and brass foundries, engineering works, cotton-machinery works, and steam boiler works, and a considerable and increasing coasting trade with Ireland and England. In 1826 Preston became a creek of Lancaster; in 1839 it was included in the new port of Fleetwood; and in 1843 it was constituted an independent port. The number of vessels that entered the port in 1883 was 129 of 9365 tons, the number that cleared 137 of 9854 tons. By the deepening of the Ribble vessels of considerable tonnage can now unload at the new quay. But much more extensive operations in connection with the improvement of the port have (1885) been projected. At an estimate cost of £800,000 [\$3,888,000], the Ribble is to be deepened for a distance of about 12 miles to the point where it falls into the Irish Sea, and a new wet dock is to be constructed, with an area of 40 acres, in the centre of the Ribble valley, between the existing river-course and the intended diversion of the channel. The dock will be 13,240 feet long and 600 feet wide. Four large warehouses are to be erected along the entire length of its east side. In addition to the main dock a timber dock of 25 acres is to be constructed, and also two large graving-docks, enabling vessels up to 1000 tons burden to be constructed.

The population of the parliamentary borough in 1811 was 17,115, in 1841 50,073, in 1871 85,427, and in 1881 93,720; that of the municipal borough, the area of which was extended in 1880 to 3721 acres, amounted in 1881 to 96,537 (males 44,264, females, 52,273). Preston returns two members to the House of Commons.

At Walton-le-Dale, close to Preston, where the Roman road crosses the Ribble, there are remains of a Roman post.

Saxon ware, as well as Roman remains and coins, have been found in the neighborhood. The mound at Penwortham, to the southwest of the town, was probably a mote-hill of the Saxons. Preston owes its rise to the decay of Ribchester, which it gradually superseded as the port of the Ribble. In the reign of Athelstane the whole district of Amounderness was granted to the cathedral-church of York. The capital of the hundred, on account of this ecclesiastical connection, came to be known as "Priest's town," afterwards changed to "Preston." It possessed two monastic foundations, (1) a convent of Gray Friars founded in 1221 by Edmund, earl of Lancaster, son of Henry II., a little to the west of the Friargate, and occupied after the dissolution first as a private residence, then until 1790 as the house of correction, and subsequently as cottages, and now superseded by an iron-foundry; and (2) an ancient hospital dedicated to St. Mary Magdalen, now occupied by the Roman Catholic church of St. Walpurgis. The town is celebrated for its merchant guild celebrations, of which the earliest on record is that of 1329. On account of the devastations to which the district was subjected by the Danes the church of York abandoned its possessions, and Tostig, brother of Harold, became lord paramount. At the Conquest it was granted, along with other possessions, to Roger de Poitou, and on his defection was forfeited to the crown. It possessed at an early period the charter of "a guild merchant, with hanse" and other customs belonging to such guild. Another charter was granted by Henry II., conferring on the inhabitants similar privileges and liberties to those enjoyed by the inhabitants of Newcastle-on-Tyne. Its privileges were confirmed and extended by King John, and in the 23d of Edward I. it obtained the right to send members to Parliament. In 1323 Robert Bruce partly destroyed it by fire. In 1617 it was visited by James I. on his return from Scotland. On the outbreak of the Civil War it declared for King Charles, but on the 12th February, 1643, it was taken by the Parliamentary forces under Sir John Seaton. Near the town, on the 17th of August, 1648, the Scots under Hamilton sustained an overwhelming defeat from Oliver Cromwell. On the 9th of November, 1715, Preston was occupied by the troops of the Pretender, and by their surrender on the 13th of the same month the death blow was given to his cause. On the 27th of November, 1745, it was entered by Charles, the young Pretender, on his Quixotic march towards London. By the Municipal Act of 1835 the borough is divided into six wards, comprising the ancient borough of Preston and the township of Fishwick, and is governed by a mayor, twelve aldermen, and thirty-six councillors.

PRESTWICH, a town of Lancashire, is situated on a branch of the Lancashire and Yorkshire Railway, 4 miles northwest of Manchester and 5 south of Bury. It possesses cotton manufactures, but consists chiefly of handsome mansions and villas inhabited by Manchester merchants. The church of St. Bartholomew occupies an eminence overlooking the Irwell. In the neighborhood is the county lunatic asylum. The population of the Urban sanitary district (area 1917 acres) in 1871 was 6820, and in 1881 it was 8627.

PRESUMPTION. See **EVIDENCE**, vol. viii. p. 650, sq.

PRÉVESA, the chief town of a sandjak in the Turkish vilayet of Janina, commanding the entrance to the Gulf of Arta. Its harbor is small, but it is a port of call for the steamers of the Austrian Lloyd and has a considerable trade in the export of oil, wool, valonia, etc. Prevesa, which represents the ancient *Nicopolis* (*q. v.*) has a population of about 7000.

PRÉVOST, **PIERRE** (1751-1839) son of a Protestant clergyman in Geneva, was born in that city on 3d March, 1751, and was educated for a clerical career. But he forsook it for law, and this too he quickly deserted to devote himself to education and to travelling. He became intimate with J. J. Rousseau, and, a little latter, with Dugald Stewart, having previously distinguished himself as a translator of and commen-

tator on Euripides. Frederick II. of Prussia secured him in 1780 as professor of philosophy, and made him member of the Academy of Sciences in Berlin. He there became acquainted with Lagrange, and was thus led to turn his attention to science. After some years spent on political economy (as in Adam Smith's *Wealth of Nations*) and on the principles of the fine arts (in connection with which he wrote, for the *Berlin Memoirs*, a remarkable dissertation on poetry) he returned to Geneva and commenced his works on magnetism and on heat. Interrupted occasionally in his studies by political duties, in which he was often called to the front, he remained professor of philosophy at Geneva till he was called in 1810 to the chair of physics. He died at Geneva on 8th April, 1839. Prévost published much on philology, philosophy, and political economy; but he will be remembered mainly on two accounts—(1) his having published, with additions of his own, the posthumous memoirs of the ingenious Le Sage [see *ATOM*, vol. iii. p. 41 and *ATTRACTION*]; and (2) his having first enunciated the theory of exchanges (see *RADIATION*), on which has been based one of the grandest experimental methods of modern times. He was distinguished as much for his moderation, precision and truthfulness as for his extraordinary versatility.

PRÉVOST D'EXILLES, ANTOINE FRANÇOIS (1697–1763), more commonly called the abbé Prévost, one of the most important French novelists of the 18th century, was born at Hesdin in Artois on 1st April, 1697. His father was of good family, and held legal employments of some importance. Prévost was educated by the Jesuits, first at Hesdin and then at Paris. At the age of sixteen he left the Collège d'Harcourt and enlisted. This, was, however, at the close of the War of the Spanish Succession, and he soon returned to the Jesuits, and was almost persuaded to enter the order. According to some accounts he actually did so, but a truant disposition once more came on him and he again joined the army, apparently obtaining some commission. It is, however, not easy to make his statement that he passed five or six years thus tally with the positive assertion that in 1719 he once more sought the cloister, this time joining the famous learned community of the Benedictines of St. Maur. He took the vows finally in 1720, and it would appear that for some seven years he devoted himself without repining to study at various houses of the order, preaching, teaching, and writing some part of the *Gallia Christiana*. In 1727, however, or thereabouts, (for the details of Prévost's life, though unusually interesting, are most vaguely and insufficiently recorded) he once more broke bounds and fled to Holland. It is said that the immediate occasion was nothing more than a wish he had formed to be transferred to Cluny, and which made him commit some technical misdemeanor. However, this may be, he was for six years an exile in Holland and England, and one story even asserts that he contracted a regular or rather irregular marriage during this period. He certainly published the first of his remarkable novels, the *Mémoires d'un Homme de Qualité*, in 1728, and continued them for some years. Besides this he produced much miscellaneous work—*Cléland*, another novel; *Manon Lescaut*, his masterpiece (which is a kind of appendix to his first book); and a periodical publication, partly in the style of the *Spectator* and partly in that of a literary review, called *Le Pour et le Contre*. All these were begun and most of them were finished before 1735, when he was back in France and produced his last novel of importance, the *Doyen de Killérine*, in which, as in *Cléland*, he made much use of his English sojourn. He returned to France openly and with the royal permission, being allowed to wear the dress of the secular priesthood. Among his patrons the cardinal de Bissy and the prince de Conti are named; the latter made him his chaplain. He lived for nearly thirty years longer, composing, though not for bread, an extraordinary number of

books, some of them original, some compilations. Amongst them were an *Histoire Générale des Voyages*, historical compilations on William the Conqueror, and Margaret of Anjou, letters, moral essays, semi-scientific works, translations (including *Pamela* and *Clarissa*), and some original pieces. Of all these the novel called *Histoire d'une Grecque Moderne* (1741) has alone attracted some attention in modern times. Prévost was a facile writer and a fair critic, but except for his first three novels, and especially for *Manon Lescaut*, he would hardly be remembered save as a man of a curiously eventful and very imperfectly recorded life. His death itself has a kind of legendary character, and some of the circumstances are, it may be hoped, fictitious. He lived in a small cottage, (for, despite his immense literary work on subjects which for the most part occupy only writers for money, he seems to have written purely for love) at Chantilly, and it was his custom to walk much in the woods there. What is agreed is that he was struck with apoplexy during one of these walks, on 23d November, 1763, and was found senseless. The legend adds the hideous particular that he was not dead, and that a clumsy village surgeon, heedlessly beginning what he supposed to be a *post-mortem* examination, at once recalled his patient to life and killed him. Even without this detail there is sufficient romantic interest (without other stories, some of them demonstrably fictitious, such as that he was accidentally the cause of his father's death) about this life of a man who is at the same time uniformly represented as an indefatigable student and one of a quiet and easy-going temperament.

Prévost's three chief romances, the *Mémoires, Cléland*, and the *Doyen de Killérine*, are not unremarkable, because they hold a kind of middle place between the incident-romance of Le Sage and Defoe and the sentiment-romance of Marivaux and Richardson; but they all have the defect of intolerable length and of an indefinite fluency. *Manon Lescaut*, his one masterpiece, and one of the greatest novels of the century, is in both these respects so different that it might seem impossible that the same man should have written it. It is very short, it is entirely free from improbable incident, it is penetrated by the truest and most cunningly managed feeling, and almost every one of its characters is a triumph of that analytic portraiture which is the secret of the modern novel. The chevalier des Grieux, the hero, is probably the most perfect example of the carrying out of the sentiment, "All for love and the world well lost," that exists in fiction (it is curious that Prévost translated Dryden's play of the name), at least where the circumstances are those of ordinary and probable life. Tiberge, his friend, is hardly inferior in the difficult part of mentor and reasonable man. Lescaut, the heroine's brother, has vigorous touches as a bully and Bohemian; but the triumph of the book is Manon herself. Animated by a real affection for her lover, and false to him only because her incurable love of splendor, comfort, and luxury prevents her from welcoming privation with him or for him, though in effect she prefers him to all others, perfectly natural and even amiable in her degradation, and yet showing the moral of that degradation more vividly than a hundred characters drawn with a less complacent pencil could have done, Manon is one of the most remarkable heroines in all fiction. She had no literary ancestress; she seems to have sprung entirely from the imagination, or perhaps the sympathetic observation, of the wandering scholar who drew her. Only the *Princesse de Clèves* can challenge comparison with her before or near to her own date, and in *Manon Lescaut* the plot is much more complete and interesting, the sentiments less artificial, and the whole story nearer to actual life than in Madame de la Fayette's masterpiece. It is not easy to name a novel on the same scale which is more directly and naturally affecting at a first reading, and which on subsequent study approves itself more thoroughly as a work of art, than *Manon Lescaut*.

There is no complete edition of Prévost's works. *Œuvres Choixées* were published in 1783, and again in 1806. Of *Manon Lescaut* the editions are very numerous.

PRÉVOST-PARADOL, LUCIEN ANATOLE (1829–1870), a writer whose career, except in its unhappy end, was typical of the importance of journalism in France, was born at Paris on the 8th of August, 1829. His mother was an actress; little is said of his father.

He was educated at the Collège Bourbon, showed great brilliancy and precocity, and entered the École Normale. In 1855 he was appointed professor of French literature at Aix. He held the post, however, barely a year, resigning it to take up the pen of a leader-writer on the *Journal des Débats*. He also wrote in the *Courrier du Dimanche*, and for a very short time in the *Presse*. Even before his appointment at Aix, he had produced a book, *Revue de l'Histoire Universelle* (1854), and he continued to publish at short intervals, his chief work being a collection of essays on politics and literature, which appeared between 1859 and 1866, and some *Essais sur les Moralistes Français* (1864). He was, however, rather a journalist than a writer of books, and was one of the chief opponents of the empire on the side of moderate liberalism. He underwent the usual and popular difficulties of a journalist under that régime, and was once imprisoned. In 1865, at the extraordinarily early age of thirty-five, he was elected an Academician. He was twice a candidate for election to the Chamber, but failed each time. Three years later he visited England, and was publicly entertained at Edinburgh, an entertainment which was the occasion of some rather undignified and very foolish contrasts drawn in the English press between the position of journalists in the two countries. The accession of Emile Ollivier to power was fatal to Prévost-Paradol. There is no reason for doubting that, in common with some of the best men in France, he believed in the possibility of a liberal empire, and he accepted the appointment of envoy to the United States. This was the signal for the most unmeasured attacks on him from the republican party. He had scarcely installed himself in his post before the outbreak of war between France and Prussia occurred. Either an exaggerated feeling of patriotism, or the disappointment of his hopes in the combined wisdom of M. Ollivier and the emperor, or (as his enemies said) remorse at having betrayed his party for nothing, or more probably the action of startling news on an excitable temperament and a mind weakened and irritated by the personal invectives to which he had been subject, threw his intellect out of gear. He committed suicide at New York¹ on the 26th July, 1870. Prévost-Paradol was not in any sense a strong man, and, except for his tragic end, his name is not very likely to live either in literature or politics. His style was light and facile, but at the same time flimsy, and his thoughts were rarely profound. But he had for a time "l'esprit de tout le monde" in France, and the personal system of journalism forced him into unnatural prominence and productiveness.

PRIAM. See TROY.

PRIAPUS, the Greek god of teeming flock and fruitful field. He was unknown to the earliest Greek poets Homer and Hesiod, but in later times his worship prevailed on the fertile coasts of Asia Minor. Lampsacus on the Hellespont, nestling in its vineyards, claimed to be his birthplace. According to the people of Lampsacus he was the son of Dionysus and Aphrodite. Having the misfortune, as a child, to be plain-looking, Priapus was abandoned by his heartless parents, but a gentle shepherd who chanced to pass that way found and reared the helpless babe like his own son. As the youthful god grew to manhood he repaid his benefactor by making the flocks and herds to bring forth and multiply. So the simple shepherds worshipped him and brought him offerings of the fatlings of their flocks,—lambs and goats and heifers, and even, it is said, donkeys. As the god and guardian of gardens, vineyards, and orchards he received sacrifices of fruits and vegetables, and images of him were set up in gardens to frighten birds and thieves. Bees too were his especial care, and he had the power to disarm the evil eye. Fishermen prayed to him for an abundant harvest of the sea, and sailors in their sore distress called on him and he saved them.

¹ [At Washington.—AM. ED.]

On many a wave-beaten bluff his image stood and his altar smoked decked with flowers the earliest of the year, when winter storms were over and summer seas allured the mariner to launch his bark again. In the rites of Dionysus homage was paid to the rural god with mirth and laughter. From Greece he passed to Italy, and continued in his new home to discharge his old functions of garden-god and scarecrow.

PRIBRAM or PRIZBRAM, a prosperous mining town of Bohemia, is situated about 32 miles S. W. of Prague. The lead-mines in the vicinity have been worked for several centuries and are especially important on account of the large quantity of silver extracted from the ore. In average years this amounts to 70,000 lb, representing a money value of nearly £300,000 [\$1,458,000]. The mines belong to the Government and employ about 5000 persons. One of the shafts, 3350 feet deep, is among the deepest in the world. Besides mining, the inhabitants occupy themselves in making glass beads, soap, candles, beer, and liqueurs. The most interesting buildings are the old deanery and church, and the archiepiscopal palace, now converted into a mining academy. At the top of the Heiliger Berg, a hill rising above the town, is a church with a wonder-working image of the Virgin, which attracts numerous pilgrims. The population of Pribram in 1880 was 11,171, or, including the adjacent Birkenberg, where the largest mines are situated, 14,881.

PRICE, RICHARD (1723–1791), philosopher, son of a Dissenting minister, was born on 23d February, 1723, at Tynton, in the parish of Llangeinor, Glamorganshire. His education was conducted partly by private tutors, partly at private schools. His father was a bigoted Calvinist and seems to have been a person of morose temper, facts which may account, on the principle of reaction, for the liberal opinions and the benevolent disposition of the son. Young Price appears at an early age to have studied the works of Clarke and Butler, and to have conceived a special admiration for the theological and philosophical works of the latter writer. In his eighteenth year he removed to a Dissenting academy in London, and having completed his education became chaplain and companion to a Mr. Streatfield at Stoke-Newington. While still occupying this position he officiated in various Dissenting congregations, such as those in the Old Jewry, Edmonton, and Newington Green. By the death of Mr. Streatfield, and of an uncle in 1756 his circumstances were considerably improved, and in the following year, the year in which he first published his best-known work, a *Review of the Principal Questions in Morals*, he married a Miss Sarah Blundell, originally of Belgrave in Leicestershire. Price now resided at Newington Green, where his time appears to have been mainly occupied in the performance of his ministerial duties, though he made occasional excursions into the regions of mathematics and philosophy. In 1767 he published a volume of sermons, including one on the future state, which attracted the attention and gained him the acquaintance of Lord Shelburne, an event which had much influence in raising his reputation and determining the character of his subsequent pursuits. Soon after this date he added to his duties at Newington Green those of morning preacher to a congregation at Hackney, where his audience appears to have been more numerous and appreciative than any which he had heretofore succeeded in keeping together.

But it was not so much in the capacity of a religious teacher as a writer on financial and political questions that Price was destined to become known to his countrymen at large. In 1769 he wrote some observations addressed in a letter to Dr. Franklin on the expectation of lives, the increase of mankind, and the population of London, which were published in the *Philosophical Transactions* of that year; and, again, in May, 1770, he communicated to the Royal Society some

observations on the proper method of calculating the values of contingent reversions. The publication of these papers is said to have exercised a most beneficial influence in drawing attention to the inadequate calculations on which many insurance and benefit societies had recently been formed. In the year 1769 Price received the degree of D.D. from the university of Glasgow. In 1771 he published his *Appeal to the Public on the Subject of the National Debt*, of which subsequent editions appeared in 1772 and 1774. This pamphlet excited considerable controversy at the time of its publication, and is supposed to have influenced Pitt in re-establishing the sinking fund for the extinction of the national debt, which had been created by Walpole in 1716 and abolished in 1733. That Price's main object, the extinction of the national debt, was a laudable and desirable one would now probably be universally acknowledged. The particular means, however, which he proposed for the purpose of effecting this object are described by Lord Overstone¹ as "a sort of hocus-pocus machinery," supposed to work "without loss to any one," and consequently purely delusive. As Lord Overstone says, all the sinking funds that have been set on foot have been supported either by loans or by the produce of taxes, and have never paid off a single shilling of debt by their own agency. In 1829 Pitt's sinking fund was abolished by Act of parliament.

A subject of a much more popular kind was next to employ Dr. Price's pen. Being an ardent lover of civil and religious liberty, he had from the first been strongly opposed to the war with the American colonies, and in 1776 he published a pamphlet entitled *Observations on Civil Liberty and the Justice and Policy of the War with America*. Several thousand copies of this work were sold within a few days; a cheap edition was soon issued; the pamphlet was extolled by one set of politicians and abused by another; amongst its critics were Dr. Markham, archbishop of York, John Wesley, and Edmund Burke; and its author rapidly became one of the best-known men in England. In recognition of his services in the cause of liberty by the publication of this pamphlet Dr. Price was presented with the freedom of the city of London, and it is said that the encouragement derived from this book had no inconsiderable share in determining the Americans to declare their independence. A second pamphlet on the war with America, the debts of Great Britain, and kindred topics followed in the spring of 1777, and whenever the Government thought proper to proclaim a fast-day Dr. Price took the opportunity of declaring his sentiments on the folly and mischief of the war. His name thus became identified, for good repute and for evil repute, with the cause of American independence. He was the intimate friend of Franklin; he corresponded with Turgot; and in the winter of 1778 he was actually invited by Congress to transfer himself to America and assist in the financial administration of the insurgent States. This offer he refused from unwillingness to quit his own country and his family connections, concluding his letter, however, with the prophetic words that he looked "to the United States as now the hope, and likely soon to become the refuge of mankind."

One of Price's most intimate friends was the celebrated Dr. Priestley, but this circumstance did not prevent them from taking the most opposite views on the great questions of morals and metaphysics. In 1778 appeared a published correspondence between these two liberal theologians on the subjects of materialism and necessity, wherein Price maintains, in opposition to Priestley, the free agency of man and the unity and immateriality of the human soul. Both Price and Priestley were in theological opinion what would now vaguely be called "Unitarians," though they occu-

pied respectively the extreme right and the extreme left position of that school. Indeed Price's opinions would seem to have been rather Arian than Socinian.

After the publication of his pamphlet on the American war Dr. Price became an important personage. He now preached to crowded congregations, and, when Lord Shelburne acceded to power, not only was he offered the post of private secretary to the premier, but it is said that one of the paragraphs in the king's speech was suggested by him and even inserted in his very words.

In 1786 Mrs. Price died, and as there were no children by the marriage, and his own health was failing, the remainder of Price's life appears to have been somewhat clouded by solitude and dejection. It was illuminated, however, by one bright gleam, the eager satisfaction with which he witnessed the passing events of the French Revolution. "I could almost say, Lord, now lettest thou thy servant depart in peace, for mine eyes have seen thy salvation. . . . After sharing in the benefits of one Revolution, I have been spared to be a witness to two other revolutions, both glorious."² The darker side of the picture he happily did not live to see. On the 19th of April, 1791, he died, worn out with suffering and disease. His funeral was conducted at Bunhill Fields by Dr. Kippis, and his funeral sermon was preached on the following Sunday by Dr. Priestley, names, which like his own, are specially honorable in the roll of English Nonconformist divines.

On the 4th of November, 1789, Price had preached at the meeting-house in the Old Jewry, before the Society for commemorating the Revolution in Great Britain, his celebrated sermon on the Love of our Country. This sermon, together with a speech subsequently made by him at a public dinner at the London Tavern, rendered him peculiarly obnoxious to Burke, and brought down upon him some of the fiercest denunciations of that brilliant but impassioned writer in his *Reflections on the Revolution in France*.

Price's reputation rests mainly upon the position which he occupies in the history of moral philosophy. His ethical theories are contained in the treatise already mentioned, a *Review of the Principal Questions in Morals*, the third edition of which, expressing "the author's latest and maturest thoughts," was published in 1787. This work is professedly directed against the doctrines of Hutcheson, but the treatment as a whole is constructive rather than polemical. Price's views approximate more closely to those of Cudworth than to those of any other English moralist; but they are mainly interesting in the history of morals on account of their resemblance to the theories subsequently propounded by Kant. The main positions of Price's treatise are three, which may be stated as follows: (1) actions are in themselves right or wrong; (2) right and wrong are simple ideas incapable of analysis; (3) these ideas are perceived immediately by the intuitive power of the reason or understanding, terms which he employs indifferently.

To the first of these positions it is not, at first sight, easy to attach any precise meaning, nor does even a careful perusal of the work altogether remove the ambiguity. The most natural interpretation, perhaps, of the expression that "an action is right in itself" is that it is right without any relation to the nature of the agent, the end aimed at, or the circumstances under which it is performed. But, apart from the fact that the objections to such a theory would be too obvious to be overlooked, the following passage is sufficient to show that Price cannot have entertained it: "All actions being necessarily right, indifferent or wrong; what determines which of these an action should be accounted is the truth of the case, or the relations and circumstances of the agent and the objects. In certain relations there is a certain conduct right. There are certain manners of behavior which we unavoidably approve, as soon as these relations are known. Change the relations, and a different manner of behavior becomes right. Nothing is clearer than that what is due or undue, proper or improper to be done, must vary according to the different natures and circumstances of beings. If a particular treatment of one nature is right, it is impossible that the same treatment of a different nature, or of all natures, should be right" (ch. vi.). What, then, does he mean by the phrase that "an

¹ Lord Overstone reprinted in 1857, for private circulation, Price's and other rare tracts on the national debt and the sinking fund.

² Sermon on the Love of our Country.

action is right or wrong *in itself*?¹ Excluding the meaning which we have set aside, he may wish to express either that actions are right or wrong irrespectively of their consequences, or that the same action would appear right or wrong not to man only but to all intelligent beings, or, as seems to be the case, he may sometimes wish to express one of these meanings and sometimes the other.

The second and third positions, that right and wrong are simple ideas incapable of analysis, and that they are perceived by an intuitive act of the reason, are succinctly stated in the following passage: "Tis a very necessary previous observation that our ideas of right and wrong are simple ideas, and must therefore be ascribed to some power of immediate perception in the human mind. He that doubts this, need only try to give definitions of them, which shall amount to more than synonymous expressions" (ch. i. sect. 1). In this and similar passages the question in dispute between the two rival schools of moralists is brought to a definite issue. Does the term "right" admit of any explanation, definition or analysis, or is it simply inexplicable? The majority of moralists have adopted the former alternative, and have endeavored to explain the idea of right in subordination to that of good. Any course of action which has, on the whole, a tendency to promote the happiness or to alleviate the misery of mankind they denominate as right; and any course of action which has a contrary tendency they denominate as wrong. Price, on the other hand, maintains that when we say an action is right we can give no further account of it, that we state an ultimate fact which neither requires nor can receive any further explanation. The connection of the third with the first and second positions is obvious. Right and wrong, being simple ideas, and being, moreover, qualities of actions, considered in themselves, are regarded by Price as being perceived immediately by the reason just in the same way that color is perceived by the eye or sound by the ear. That they are perceived immediately follows from the fact that they are simple ideas, incapable of analysis; that they are perceived by the reason or understanding, and not by a sense, is maintained in an elaborate course of argument against Hutcheson. When the reason or understanding has once apprehended the idea of right, it ought to impose that idea as a law upon the will; and thus it becomes, equally with the affections, a spring of action.

The place of the emotional part of our nature in this system is not very clear. The predominant view, however, appears to be that, while it is the source of all vicious action, it may, when enlightened by reason, aid in the determination of virtuous conduct. The school of Hutcheson, on the other hand, maintains that the emotions are, in the last analysis, the original source of all conduct, be it virtuous or vicious.

As already stated, the English moralist with whom Price has most affinity is Cudworth. The main point of difference is that, while Cudworth regards the ideas of right and wrong as *notiones* or modifications of the intellect itself, existing first in germ and afterwards developed by circumstances, Price seems rather to regard them as acquired from the contemplation of actions, though acquired necessarily, immediately and intuitively.

Those who are familiar with the writings of Kant (which are posterior to those of Price) will recognize many points of resemblance both in the fundamental ideas and in the modes of expression. Amongst these points are the exaltation of reason; the depreciation of the affections; the unwillingness of both authors to regard the "partial and accidental structure of humanity," the "mere make and constitution of man," as the basis of morality—in other words, to recognize ethical distinctions as relative to human nature; the ultimate and irresolvable character of the idea of rectitude; the notion that the reason imposes this idea as a law upon the will, becoming thus our independent spring of action; the insistence upon the reality of liberty or "the power of acting and determining"; the importance attached to reason as a distinct source of ideas; and, it may be added, the discrimination (so celebrated in the philosophy of Kant) of the moral (or practical) and the speculative understanding (or reason).¹

Price's ethical theories are almost the antithesis of those of Paley, whose *Moral and Political Philosophy* appeared in 1785. Speaking of this work in his third edition Price says, "Never have I met with a theory of morals which has appeared to me more exceptionable."

Most of Price's more important works have been already mentioned. To these may be added an *Essay on the Population of England* (2d ed., 1780); two *Past-day Sermons*, published respectively in 1779 and 1781; and *Observations on the Importance of the American Revolution and the means of rendering it a benefit to the World*, 1784.

¹ Price does not, like Kant, distinguish between the words "reason" and "understanding."

A complete list of his works is given as an appendix to Dr. Priestly's *Funeral Sermon*. Notices of Price's ethical system occur in Mackintosh's *Progress of Ethical Philosophy*, Jouffroy's *Introduction to Ethics*, Whewell's *History of Moral Philosophy in England*, Bain's *Mental and Moral Sciences*, the article on *Ethics* (vol. viii. p. 581), and a monograph on Shaftesbury and Hutcheson by the writer of this article in Sampson Low & Co's series of *English Philosophers*. The authority for his life is a memoir by his nephew, William Morgan. (T. F.)

PRICHARD, JAMES COWLES (1786-1848), the founder of ethnology or anthropology in England, was born on 11th February, 1786, at Ross in Herefordshire. His parents were of the Society of Friends, and his career in after life partly turned on his not receiving the then narrow course of school education, but a wider home training in modern languages and general literature. Living at Bristol, he occupied himself much in examining the natives of different countries who were to be met with amongst the shipping of the port, and he would occasionally bring a foreigner to his father's house. Thus in early life he laid a foundation for his later researches, and he was mainly led to adopt medicine as a profession from the facilities which its study offered for the investigation of man. He took his degree at Edinburgh, afterwards reading for a year at Trinity College, Cambridge, whence, joining the Church of England, he migrated to St. John's College, Oxford, afterwards entering as a gentleman commoner at Trinity College, Oxford, but seeking no degree in either university. In 1810 he settled at Bristol as a physician, and in 1813 published his *Researches into the Physical History of Man*, in 2 vols., afterwards extended to 5 vols. The central principle of the book is the primitive unity of the human species, acted upon by causes which have since divided it into permanent varieties or races. Dr. Prichard states that he was led into this inquiry by the diversity of races being alleged as a disproof of the Mosaic records; in argument, however, he endeavored not to rely on theology, but to proceed "by the ordinary method of observation and experience." The work is dedicated to Blumenbach, whose five races of man are adopted. But where Prichard excelled Blumenbach and all his other predecessors was in his grasp of the principle that people should be studied by combining all available characters, and he accordingly discusses them at large with regard at once to bodily form, language, and state of civilization. One investigation begun in this work requires special mention, the bringing into view of the fact, neglected or contradicted by philologists, that the Celtic nations are allied by language with the Slavonian, German, and Pelasgian (Greek and Latin), thus forming a fourth European branch of the Asiatic stock (which would now be called Indo-European or Aryan). Prichard, whose own Celtic descent is shown by his name, was a fitting promulgator of this leading principle of Celtic research. His special treatise containing Celtic compared with Sanskrit words appeared in 1831 under the title *Eastern Origin of the Celtic Nations*. It is remarkable that the essay by Adolph Pietet, *De l'Affinité des Langues Celtiques avec le Sanscrit*, which was crowned by the French Academy and made its author's reputation, should have been published in 1837 in evident ignorance of the earlier and in some respects stricter investigations of Prichard. His work has been re-edited since by Dr. R. G. Latham (London, 1857), with large additions of Celtic material. Prichard's *Analysis of Egyptian Mythology* (London, 1819) had some popularity at the time, and was translated into German with a preface by A. W. v. Schlegel; its comparison of the Egyptian religion with Brahmanism is now obsolete, and its author was unwise in bringing out a new edition in 1838, after Champollion's *Grammar and Dictionary* had opened the actual Egyptian inscriptions to scholars. Dr. Prichard's last important book was a revision and condensation of his researches into a *Natural History of Man* (London, 1843), which has gone through several editions, and remains a standard work of the anthropologist's library. Towards

the end of his life, in recognition of his services, he was made a commissioner of lunacy, and in consequence removed from Bristol to London, where he died in 1848.

A memoir by his friend, Dr. Hodgkin, will be found in the *Journal of the Ethnological Society*, of which he was one of the early presidents.

PRIDE, THOMAS (d. 1658), Parliamentary officer, was of humble origin, and is stated to have been brought up by the parish of St. Bride's, London. Subsequently he was a drayman and a brewer. At the beginning of the Civil War he served as ensign under the earl of Essex, and gradually obtained promotion to the rank of colonel. He distinguished himself at the battle of Preston, 17th August, 1648, and in Cromwell's Scottish campaign he held command of a brigade. He was noted for his resolute character and extreme anti-Royalist sentiments. After the Commons had voted that the king's concessions at Newport were a basis for a settlement, he was chosen by the army chiefs to effect their purpose of "purging" the Commons. Taking his stand at the entrance of the House of Commons with a written list in his hand, he caused the arrest of the Royalist members who were pointed out to him, and placed them in custody. After about a hundred members had been dealt with by this ordinance, subsequently known as "Pride's Purge," the mutilated House of Commons proceeded to bring the king to trial. Pride was one of the judges of the king and signed his death-warrant. Under Cromwell he received the honor of knighthood, and was also chosen a member of the new House of Lords. He died at Nonsuch on 23d October, 1658, and after the Restoration his body was dug up and suspended on the gallows at Tyburn along with that of Cromwell.

Noble, *Lives of the Regicides*; Bate, *Lives of the Prime Actors and Principal Contrivers of the Murder of Charles I.*; Carlyle, *Cromwell*.

PRIDEAUX, HUMPHREY (1648–1724), dean of Norwich, was the third son of Edward Prideaux of Place in Padstow, Cornwall, by his wife Bridget, daughter of John Moyle of Bake in the same county. Both families were of good repute in the west of England, and that of Prideaux was especially influential, as is shown by the elaborate pedigrees in Sir John Maclean's *Deanery of Trigg Minor* (ii. 194–242). He was born at Place on 3d May, 1648, and received the rudiments of his education at the grammar-schools of Liskeard and Bodmin. In 1665 he was placed at Westminster under Dr. Busby, and after staying there for three years was admitted a student at Christ Church, Oxford, taking his degrees in the following order, B.A. in 1672, M.A. 1675, B.D. 1682, and D.D. 1686. It was the rule of that house that its best scholars should, after they had taken their first degree be employed in editing some classical writer, and Prideaux was accordingly deputed to superintend a new edition of Lucius Florus and to prepare for the press, from a Greek MS. in the Bodleian, a work by Johannes Malalas. The first of these works is now exceedingly scarce, if indeed a copy be in existence, and the second was, on his advice, left in manuscript. The famous Arundel marbles had just been given to the university, and Prideaux was instructed to undertake the task of describing the gift, his transcript of the inscriptions, with a commentary and additions from the Selden marbles, appearing in 1676. In 1679 he was appointed to the rectory of St. Clement's, Oxford, and in the same year became Hebrew lecturer at Christ Church, whereupon he published two Hebrew tracts of Maimonides with a Latin translation and annotations. Prideaux continued tutor at Christ Church until February, 1686, holding for the last three years the rectory of Bladon with Woodstock; but in 1686 he exchanged for the benefice of Saham in Norfolk, and took up his residence in that county, with which he had for some

time been connected through his appointment in August, 1681, to a prebendal stall in Norwich cathedral. The sympathies of Prideaux inclined to Low Churchism in religion and to Whiggism in politics, and during the years which immediately preceded and succeeded the Revolution of 1688 he took an active part in the controversies of the day, publishing in quick succession the following pamphlets—*The Validity of the Orders of the Church of England* (1688), *Letter to a Friend on the Present Convocation* (1690), *The Case of Clandestine Marriages stated* (1691). Prideaux was promoted to the archdeaconry of Suffolk at the close of 1688 and to the deanery of Norwich in June, 1702, and it was the wish of some of the members of the episcopal bench that he should have been appointed to the bishopric of Norwich, but their desires were not gratified. In 1694 he was obliged, through ill-health, to resign the rectory of Saham, and after having held the vicarage of Trowse for fourteen years (1696–1710) he found himself incapacitated, by repeated attacks of stone, from further parochial duty. He died at Norwich on 1st November, 1724, and was buried in the cathedral on 4th November. His wife, Bridget, only daughter and sole heir of Anthony Bokenham of Helmingham, Suffolk, died at Norwich in November, 1700; they were married on 16th February, 1686.

Many of the dean's writings were of great value and their popularity continued unimpaired down to the present century. His *Life of Mahomet*, originally published in 1697, had passed through eight editions by 1723, and his *Directions to Churchwardens*, first issued in 1701, reached a twelfth edition in 1871. But the favor with which these volumes were received, great as it was, contrasts but badly with the extraordinary success of his account of *The Old and New Testament connected in the History of the Jews*, a work of great research and learning. This has been many times reissued since the appearance of the first part in 1716 and has been translated into the French, German and Italian languages. Le Clerc subjected it to a critical examination. A series of remarks upon it is contained in Walter Moyle's works, and continuations were compiled by Samuel Shuckford and Michael Russell. Prideaux published several small tracts, and many volumes of manuscript collections are in the possession of his descendant at Place. These, with particulars of the dean's letters in print and in manuscript and with bibliographical details of his numerous publications, are described in the *Bibliotheca Cornubiensis*, ii. 527–533 and iii. 1319. A volume of his letters to John Ellis, some time under-secretary of state, was edited by Mr. E. M. Thompson for the Camden Society in 1875 and contained a vivid picture of Oxford life after the Restoration, but it will always be regretted that some passages in his correspondence should betray feelings unworthy of the writer. An anonymous life of Dean Prideaux appeared in 1743 but it was mainly compiled from a larger memoir by his son.

PRIESSNITZ, VINCENTZ. See HYDROPATHY, vol. xii. p. 575 sq.

PRIEST (Ger. *Priester*, Fr. *prêtre*) is a contracted form of "presbyter" (πρεσβύτερος, "elder;" see PRESBYTER), a name of office in the early Christian church, already mentioned in the New Testament. But in the English Bible the presbyters of the New Testament are called "elders," not "priests;" the latter name is reserved for ministers of pre-Christian religions, the Semitic כֹּהֲנִים (*kōhānīm*, sing. *kōhēn*) and כֹּהֲנִים (*kemārīm*), or the Greek ἱερεῖς. The reason of this will appear more clearly in the sequel; it is enough to observe at present that, before our English word was formed the original idea of a presbyter had been overlaid with others derived from pre-Christian priesthoods, so that it is from these and not from the etymological force of the word that we must start in considering historically what a priest is. The theologians of the Greek and Latin churches expressly found the conception of a Christian priesthood on the hierarchy of the Jewish temple, while the names by which the sacerdotal character is expressed—ἱερεῖς, *sacerdos*—originally designated the ministers of sacred things in Greek and Roman heathenism, and then came to be

used as translations into Greek and Latin of the Hebrew *kōhēn*. *Kōhēn*, *ιερεὺς*, *sacerdos*, are in fact fair translations of one another; they all denote a minister whose stated business was to perform, on behalf of the community, certain public ritual acts, particularly sacrifices, directed godwards. Such ministers or priests existed in all the great religions of ancient civilization and indeed a priesthood in the sense now defined is generally found, in all parts of the world, among races which have a tribal or national religion of definite character, and not merely an unorganized mass of superstitious ideas, fears and hopes issuing in practices of sorcery. The term "priest" is sometimes taken to include "sorcerer," just as religion is often taken to include the belief in mysterious or superhuman powers which can be constrained by spells, but this is an abuse of language. Religion begins when the relation of the divine powers to man is conceived—on the analogy of the relations of formed human society—as having a certain stable personal character on which the worshippers can calculate and act. The gods of the ancient religions might do arbitrary acts, but their conduct towards man was not habitually arbitrary. In so far as they could be reckoned on, they had a religion; in so far as they were still arbitrary, or themselves subject to the influence of unknown forces, room was left for the persistence of sorcery and similar superstitions, which history proves to have always renewed their strength in times when religious faith failed, when men ceased to be fully persuaded that the favor and help of the gods were sure if certain known conditions were fulfilled. In the best times of the antique religions no such doubts were felt, the real interest of the gods in their worshippers was certain, for all good things came from their hands and the actions on the part of individuals or of the state by which their favor was maintained, lost or regained were matter of undisputed tradition. The main points of this tradition were known to every one concerned, and difficult cases were resolved by experts—such as the Greek *ἐρηγῆται*—or referred, through some form of oracle, to the gods themselves. The relations of the gods to men, as thus traditionally defined, were not so much to individuals as to families, tribes or states, and it was the business of the community to see that they were maintained on a sound footing. This was partly done by watching over the conduct of individuals, for every one had certain religious duties; and conversely, certain acts of a private as well as of a public character were hateful to the gods, and, unless expiated, might bring calamity to the whole community. But it was also necessary to honor the gods by direct acts of homage, by images and temples, by feasts and sacrifices. To attend to these things was an essential part of the right government of the state, the right ordering of tribal and family life, and they could not be wholly left to the spontaneity of individuals, but necessarily fell to be performed on behalf of the community by its natural head or by specially appointed officials. In either case the service done to the gods on behalf of many may properly be called "priestly service," though in the former case the priesthood, being only one of the many functions of domestic or civil authority, was not necessarily recognized by a special name. Both kinds of priesthood are found in the old civilization of southern Europe; thus Homer knows special priests who preside over ritual acts in the temples to which they are attached, but his kings also do sacrifice on behalf of their people. The king, in fact, both in Greece and in Rome, was the acting head of the state religion, and when the regal power came to an end his sacred functions were not transferred to the ordinary priests, but either they were distributed among high officers of state, as archons and prytanes, or the title of "king" was still preserved as that of a religious functionary, as in the case of the *rex sacrorum* at Rome and the *archon basileus* at Athens. In the domestic circle the union of priesthood and natural head-

ship was never disturbed; the Roman *paterfamilias* sacrificed for the whole family. On the other hand, *gentes* and *phratræ*, which had no natural head, had special priests chosen from their members; for every circle of ancient society, from the family up to the state, was a religious as well as a civil unity, and had its own gods and sacred rites. The lines of religious and civil society were identical, and so long as they remained so no antagonism could arise between the spiritual and the temporal power. In point of fact, in Greece and Rome the priest never attained to any considerable independent importance; we cannot speak of priestly power and hardly even of a distinct priestly class. In Greece the priest, so far as he is an independent functionary and not one of the magistrates, is simply the elected or hereditary minister of a temple charged with "those things which are ordained to be done towards the gods" (see Aristotle, *Pol.*, vi. 8), and remunerated from the revenues of the temple or by the gifts of worshippers and sacrificial dues. The position was often lucrative and always honorable and the priests were under the special protection of the gods they served. But their purely ritual functions gave them no means of establishing a considerable influence on the minds of men, and the technical knowledge which they possessed as to the way in which the gods could be acceptably approached was neither so intricate nor so mysterious as to give the class a special importance. The funds of the temples were not in their control, but were treated as public moneys. Above all, where, as at Athens, the decision of questions of sacred law fell not to the priests but to the college of *ἐρηγῆται*, one great source of priestly power was wholly lacking. There remains, indeed, one other sacred function of great importance in the ancient world in which the Greek priests had a share. As man approached the gods in sacrifice and prayers, so too the gods declared themselves to men by divers signs and tokens, which it was possible to read by the art of DIVINATION (*q.v.*). In many nations divination and priesthood have always gone hand in hand; at Rome, for example, the augurs and the *XVviri sacrorum*, who interpreted the Sibylline books, were priestly colleges. In Greece, on the other hand, divination was not generally a priestly function, but it did belong to the priests of the Oracles (see ORACLE). The great oracles, however, were of Panhellenic celebrity and did not serve each a particular state, and so in this direction also the risk of an independent priestly power within the state was avoided.¹

In Rome, again, where the functions of the priesthood were politically much more weighty, where the technicalities of religion were more complicated, where priests interpreted the will of the gods, and where the pontiffs had a most important jurisdiction in sacred things, the state was much too strong to suffer these powers to escape from its own immediate control; the old monarchy of the king in sacred things descended to the inheritors of his temporal power; the highest civil and religious functions met in the same persons (comp. Cic. *De Dom.*, i. 1); and every priest was subject to the state exactly as the magistrates were, referring all weighty matters to state decision and then executing what the one supreme power decreed. And it is instructive to observe that when the plebeians extorted their full share of political power they also demanded and obtained admission to every priestly college of political importance, to those, namely, of the pontiffs, the augurs, and *XVviri sacrorum*. The Romans, it need hardly be said, did not have hereditary priests.²

The same close connection between state and religion

¹ For the Greek priests, see, besides Schömann and other works on Greek antiquities, Newton, *Essays on Art and Archaeology*, p. 136 sq. (from epigraphic material).

² On the Roman priests, see in general Marquardt, *Römische Staatsverwaltung*, vol. iii., and for the pontiffs in particular PONTIFEX, *supra*, p. 470.

meets us, under the forms of Oriental despotism, in the great civilizations of Egypt and Babylonia. Here all civil and religious power has its source in the king, and he is therefore himself the centre and head of the priesthood. Nowhere is religion more thoroughly a part of statecraft than in ancient Egypt; the official religion of the united monarchy is plainly an artificial structure built up by priestly fable and speculation out of the old religions of the several nomes and dedicated to the service of the monarchy. The priesthood accordingly has large functions, including, besides the service of the temples, astrology and divination, and the development and preservation of a sort of official theology and ritual theory, by which the conflicting elements of local religion and mythology were reconciled. It has a strict bureaucratic organization, like any other branch of the administration; the higher priests are great officers of state, with civil and even military power; under Smendes (XXIst Dynasty) the priests of Amon at Thebes actually ascended the throne. An absolute monarchy, in which the king is revered as himself a divine person and in which the ministers of religion are the organs of a comprehensive and mysterious statecraft, obviously offers to sacerdotalism a far greater career than was possible among the free peoples of Greece and Rome; and the priests held in their hands the whole wisdom of the Egyptians, and so kept all parts of culture in such strict subservience, alike to the gods and to the monarchy, as to make the empire of the Nile the ideal type of absolutism based on divine right. In this respect, however, the Babylonian system, of which we have less ample details, probably fell little short of the Egyptian. Here also we find, as in Egypt, a state religion built on a priestly fusion of older cults, and therefore also a mythological theology which is not folk-lore but priest-lore. The older elements of religion are worked into a theoretic system of astral powers, and this in turn gives rise to a priestly study of astrology containing elements of real science. This complicated and many-sided lore gave to the priesthoods of Chaldæa and the Nile the character of a learned class, which is quite wanting in Greece and Rome, and it also produced a sacred and sacerdotal literature quite different in range and importance from such Western analogues as the Sibylline books or the *libri augurales*.

Against the genuine intellectual achievements of the Chaldæan and Egyptian priests must be set the incorporation of magic and sorcery in the circle of priestly sciences. The ordinary functions of religion are directed to conciliate or persuade the gods, but magic pretends to constrain the supernatural powers, and belongs, as we have seen, to superstition rather than to religion. But in Egypt and Babylonia the state religion was an artificial mosaic of old beliefs, in which the crassest superstitions had their place, and thus magical arts received a state recognition and were part of the business of the state priests in a way unknown in the West. Occult arts, in fact, are part of the machinery of government. Now when we go still farther east to the Aryans of India, we again find the idea prominent that certain formulas have the power of constraining the gods, but in a form somewhat different from that of mere sorcery, and less primitive. All ancient peoples sought victory from the gods, and they sought it by sacrifice and prayer; but nowhere is the power of sacrifice more strongly felt than among the ancient Aryans; it was Agni, the sacrificial flame, as ancient legend has it, that led the conquerors of India from victory to victory. But there were also bloody struggles among the Aryans themselves, between men who invoked the same deity, and here the issue was not whether Indra was stronger than the gods of the non-Aryans, but which of the rival sacrifices he would accept. Now the priests accompanied sacrifice with songs of invocation, and so it became essential to have the most powerful song, which the god could not re-

sist. The knowledge of these songs and of all that accompanied their use was handed down in priestly families, whose aid became indispensable to every sovereign, and at last out of these families there grew up the great and privileged caste of Brahmans. For further details as to the development of the priestly caste and wisdom in India the reader must refer to BRAHMANISM; here it is enough to observe that among a religious people a priesthood which forms a close and still more an hereditary corporation, and the assistance of which is indispensable in all religious acts, must rise to practical supremacy in society except under the strongest form of despotism, where the sovereign is head of the church as well as of the state.

Among the Zoroastrian Iranians, as among the Indian Aryans, the aid of a priest to recite the sacrificial liturgy was necessary at every offering (Herod., i. 132), and the Iranian priests (*âthravans*, later *Magi*) claimed, like the Brahmans, to be the highest order of society; but a variety of conditions were lacking to give them the full place of their Indian brethren. Zoroastrianism is not a nature religion, but the result of a reform which never, under the old empire, thoroughly penetrated the masses; and the priesthood, as it was not based on family tradition, did not form a strict hereditary caste. Under the Sāsānians, however, Zoroastrianism was a state religion in the strictest sense, and the priests attained very great power, their assistance being absolutely necessary not only in the public ritual of the fire-temple but for the constant guidance of every individual in the minute details of ceremonial observance, which make up the chief body of the religious system of the sacred books, and every breach of which involved penance. It is thus easily understood that the clergy formed a compact hierarchy not inferior in influence to the clergy of the Christian Middle Ages, had great power in the state, and were often irksome even to the great king. But the best established hierarchy is not so powerful as a caste, and the monarchs had one strong hold on the clergy by retaining the patronage of great ecclesiastical places, and another in the fact that the Semitic provinces on the Tigris, where the capital lay, were mainly inhabited by men of other faith.¹

In this rapid glance at some of the chief priesthoods of antiquity we have hitherto passed over the pure Semites, whose priesthoods call for closer examination because of the profound influence which one of them—that of the Jews—has exercised on Christianity, and so on the whole history of the modern world. But before we proceed to this it may be well to note one or two things that come out by comparison of the systems already before us. Priestly acts—that is, acts done by one and accepted by the gods on behalf of many—are common to all antique religions, and cannot be lacking where the primary subject of religion is not the individual but the natural community. But the origin of a separate priestly class, distinct from the natural heads of the community, cannot be explained by any such broad general principle; in some cases, as in Greece, it is little more than a matter of convenience that part of the religious duties of the state should be confided to special ministers charged with the care of particular temples, while in others the intervention of a special priesthood is indispensable to the validity of every religious act, so that the priest ultimately becomes a mediator and the vehicle of all divine grace. This position, we see, can be reached by various paths: the priest may become indispensable through the growth of ritual observances and precautions too complicated for a layman to master, or he may lay claim to special nearness to the gods on the ground, it may be, of his race, or it may be of habitual practices of purity and asceticism which cannot be combined with the duties of ordinary life, as, for example, celibacy was required of priestesses of Vesta at Rome. But the

¹ Compare especially Nöldeke's *Tabari*, p. 450 sq.

highest developments of priestly influence are hardly separable from something of magical superstition; the *opus operatum* of the priest has the power of a sorcerer's spell. The strength of the priesthood in Chaldea and in Egypt stands plainly in the closest connection with the survival of a magical element in the state religion, and Rome, in like manner, is more priestly than Greece because it is more superstitious. In most cases, however, where an ancient civilization shows us a strong priestly system we are unable to make out in any detail the steps by which that system was elaborated; the clearest case perhaps is the priesthood of the Jews, which is not less interesting from its origin and growth than from the influence exerted by the system long after the priests were dispersed and their sanctuary laid in ruins.

Among the nomadic Semites, to whom the Hebrews belonged before they settled in Canaan, there has never been any developed priesthood. The acts of religion partake of the general simplicity of desert life; apart from the private worship of household gods and the oblations and salutations offered at the graves of departed kinsmen, the ritual observances of the ancient Arabs were visits to the tribal sanctuary to salute the god with a gift of milk, first-fruits or the like, the sacrifice of firstlings and vows (see NAZARITE and PASSOVER), and an occasional pilgrimage to discharge a vow at the annual feast and fair of one of the more distant holy places (see MECCA). These acts required no priestly aid; each man slew his own victim and divided the sacrifice in his own circle; the share of the god was the blood which was smeared upon or poured out beside a stone (*nosb ghabghab*) set up as an altar or perhaps as a symbol of the deity. It does not appear that any portion of the sacrifice was burned on the altar, or that any part of the victim was the due of the sanctuary. We find therefore no trace of a sacrificial priesthood, but each temple had one or more doorkeepers (*sādin hājib*), whose office was usually hereditary in a certain family and who had the charge of the temple and its treasures. The sacrifices and offerings were acknowledgments of divine bounty and means used to insure its continuance; the Arab was the "slave" of his god and paid him tribute, as slaves used to do to their masters, or subjects to their lords; and the free Bedouin, trained in the solitude of the desert to habits of absolute self-reliance, knew no master except his god, and acknowledged no other will before which his own should bend. Hence the other side of Arab religion was to look for divine direction in every grave or difficult concern of life; what could not be settled in the free council of the tribesmen, or by the unenforced award of an umpire, was referred to the command of the god, and the oracle was the only authority by which dissensions could be healed, lawsuits determined, and judgment authoritatively spoken. The voice of the god might be uttered in omens which the skilled could read, or conveyed in the inspired rhymes of soothsayers, but frequently it was sought in the oracle of the sanctuary, where the sacred lot was administered for a fee by the *sādin*. The sanctuary thus became a seat of judgment, and here too compacts were sealed by oaths and sacrificial ceremonies. These institutions, though known to us only from sources belonging to an age when the old faith was falling to pieces, are certainly very ancient. Their whole stamp is primitive, and they correspond in the closest way with what we know of the earliest religion of the Israelites, the only other Semitic people whose history can be traced back to a time when they had not fully emerged from nomad life. And, in fact, the fundamental type of the Arabic sanctuary can be traced through all the Semitic lands, and so appears to be older than the Semitic dispersion; even the technical terms are mainly the same, so that we may justly assume that the more developed ritual and priesthoods of the settled Semites sprang from a state of things not very remote from what we find among the heathen Arabs. Now among the Arabs,

as we have seen, ritual service is the affair of the individual, or of a mass of individuals gathered in a great feast, but still doing worship each for himself and his own private circle; the only public aspect of religion is found in connection with divination and the oracle to which the affairs of the community are submitted. In Greece and Rome the public sacrifices were the chief function of religion, and in them the priesthood represented the ancient kings. But in the desert there is no king and no sovereignty save that of the divine oracle, and therefore it is from the soothsayers or ministers of the oracle that a public ministry of religion can most naturally spring. With the beginning of a settled state the sanctuaries must rise in importance and all the functions of revelation will gather round them. A sacrificial priesthood will arise as the worship becomes more complex (especially as sacrifice in antiquity is a common preliminary to the consultation of an oracle), but the public ritual will still remain closely associated with oracle or divination, and the priest will still be, above all things, a revealer. That this was what actually happened may be inferred from the fact that the Canaanite and Phœnician name for a priest (*kōhēn*) is identical with the Arabic *kāhīn*, a "soothsayer." Soothsaying was no modern importation in Arabia; its characteristic form—a monotonous croon of short rhyming clauses—is the same as was practiced by the Hebrew "wizards who peeped and muttered" in the days of Isaiah, and that this form was native in Arabia is clear from its having a technical name (*saḡ*), which in Hebrew survives only in derivative words with modified sense.¹ The *kāhīn*, therefore, is not a degraded priest but such a soothsayer as is found in most primitive societies, and the Canaanite priests grew out of these early revealers. In point of fact some form of revelation or oracle appears to have existed in every great shrine of Canaan and Syria,² and the importance of this element in the cultus may be measured from the fact that at Hierapolis it was the charge of the chief priest, just as in the Levitical legislation. But the use of "*kāhīn*" for "priest" in the Canaanite area points to more than this; it is connected with the orgiastic character of Canaanite religion. The soothsayer differs from the priest of an oracle by giving his revelation under excitement and often in a frenzy allied to madness. In natural soothsaying this frenzy is the necessary physical accompaniment of an afflatus which, though it seems supernatural to a rude people, is really akin to poetic inspiration. But it is soon learned that a similar physical state can be produced artificially, and at the Canaanite sanctuaries this was done on a large scale. We see from 1 Kings xviii., 2 Kings x., that the great Baal temples had two classes of ministers, *kōhānīm* and *nēbīm*, "priests" and "prophets," and as the former bear a name which primarily denotes a soothsayer, so the latter are also a kind of priests who do sacrificial service with a wild ritual of their own. How deeply the orgiastic character was stamped on the priesthoods of north Semitic nature-worship is clear from Greek and Roman accounts, such as that of Appuleius (*Metam.*, bk. viii.). Sensuality and religious excitement of the wildest kind went hand in hand, and a whole army of degraded ministers of a religion of the passions was gathered round every famous shrine.

The Hebrews, who made the language of Canaan their own, took also the Canaanite name for a priest. But the earliest forms of Hebrew priesthood are not Canaanite in character; the priest, as he appears in the older records of the time of the Judges, Eli at Shiloh, Jonathan in the private temple of Micah and

¹ *Mēshuggā*, 2 Kings ix. 11, Jer. xxix. 26,—a term of contempt applied to prophets.

² For examples, see PALMYRA and PHILISTINES; see further, Lucian, *De Dea Syria*, 36, for Hierapolis; Zosimus, i. 58, for Aphaca; Pliny, *H. N.*, xxxvii. 58 (compared with Lucian, *ut supra*, and Movers, *Phœnizier*, i. 655), for the temple of Melkart at Tyre.

at Dan, is much liker the *sādin* than the *kāhin*.¹ The whole structure of Hebrew society at the time of the conquest was almost precisely that of a federation of Arab tribes, and the religious ordinances are scarcely distinguishable from those of Arabia, save only that the great deliverance of the Exodus and the period when Moses, sitting in judgment at the sanctuary of Kadesh, had for a whole generation impressed the sovereignty of Jehovah on all the tribes, had created an idea of unity between the scattered settlements in Canaan such as the Arabs before Mohammed never had. But neither in civil nor in religious life was this ideal unity expressed in fixed institutions; the old individualism of the Semitic nomad still held its ground. Thus the firstlings, first-fruits, and vows are still the free gift of the individual which no human authority exacts, and which every householder presents and consumes with his circle in a sacrificial feast without priestly aid. As in Arabia, the ordinary sanctuary is still a sacred stone (נֹשֶׁבֶת = *nosh*) set up under the open heaven, and here the blood of the victim is poured out as an offering to God (see especially 1 Sam. xiv. 34, and compare 2 Sam. xxiii. 16, 17). The priest has no place in this ritual; he is not the minister of an altar,² but the guardian of a temple, such as was already found here and there in the land for the custody of sacred images and palladia or other consecrated things (the ark at Shiloh, 1 Sam. iii. 3; images in Micah's temple, Judges xvii. 5; Goliath's sword lying behind the "ephod" or plated image at Nob, 1 Sam. xxi. 9; no doubt also money, as in the Canaanite temple at Shechem, Judges ix. 4). Such treasures required a guardian; but, above all, wherever there was a temple there was an oracle, a kind of sacred lot, just as in Arabia (1 Sam. xiv. 41, Sept.), which could only be drawn where there was an "ephod" and a priest (1 Sam. xiv. 18 Sept. and xxiii. 6 sq.). The Hebrews had already possessed a tent-temple and oracle of this kind in the wilderness (Exod. xxxiii. 7 sq.), of which Moses was the priest and Joshua the ædituus, and ever since that time the judgment of God through the priest at the sanctuary had a greater weight than the word of a seer, and was the ultimate solution of every controversy and claim (1 Sam. ii. 25; Exod. xxi. 6, xxi. 8, 9, where for "judge," "judges," read "God"). The temple at Shiloh, where the ark was preserved, was the lineal descendant of the Mosaic sanctuary—for it was not the place but the palladium and its oracle that were the essential thing—and its priests claimed kin with Moses himself. In the divided state of the nation, indeed, this sanctuary was hardly visited from beyond Mount Ephraim; and every man or tribe that cared to provide the necessary apparatus (ephod, teraphim, etc.) and hire a priest might have a temple and oracle of his own at which to consult Jehovah (Judges xvii., xviii.); but there was hardly

another sanctuary of equal dignity. The priest of Shiloh is a much greater person than Micah's priest Jonathan; at the great feasts he sits enthroned by the doorway, preserving decorum among the worshippers; he has certain legal dues, and if he is disposed to exact more no one ventures to resist (1 Sam. ii. 12 sq., where the text needs a slight correction). The priestly position of the family survived the fall of Shiloh and the captivity of the ark, and it was members of this house who consulted Jehovah for the early kings until Solomon deposed Abiathar. Indeed, though priesthood was not yet tied to one family, so that Micah's son, or Eleazar of Kirjath-jearim (1 Sam. vii. 1), or David's sons (2 Sam. viii. 18) could all be priests, a Levite—that is, a man of Moses' tribe—was already preferred for the office elsewhere than at Shiloh (Judges xvii. 13), and such a priest naturally handed down his place to his posterity (Judges xviii. 30).

Ultimately, indeed, as sanctuaries were multiplied and the priests all over the land came to form one well-marked class, "Levite" and legitimate priest became equivalent expressions, as has been explained in detail in the article *LEVITES*. But between the priesthood of Eli at Shiloh or Jonathan at Dan and the priesthood of the Levites as described in Deut. xxxiii. 8 sq. there lies a period of the inner history of which we know almost nothing. It is plain that the various priestly colleges regarded themselves as one order, that they had common traditions of law and ritual which were traced back to Moses, and common interests which had not been vindicated without a struggle (Deut., *ut sup.*). The kingship had not deprived them of their functions as fountains of divine judgment (comp. Deut. xvii. 8 sq.); on the contrary, the decisions of the sanctuary had grown up into a body of sacred law, which the priests administered according to a traditional precedent. According to Semitic ideas the declaration of law is quite a distinct function from the enforcing of it, and the royal executive came into no collision with the purely declaratory functions of the priests. The latter, on the contrary, must have grown in importance with the unification and progress of the nation, and in all probability the consolidation of the priesthood into one class went hand in hand with a consolidation of legal tradition. And this work must have been well done, for, though the general corruption of society at the beginning of the Assyrian period was nowhere more conspicuous than at the sanctuaries and among the priesthood, the invective of Hos. iv. equally with the eulogium of Deut. xxxiii. proves that the position which the later priests abused had been won by ancestors who earned the respect of the nation as worthy representatives of a divine Torah.

The ritual functions of the priesthood still appear in Deut. xxxiii. as secondary to that of declaring the sentence of God, but they were no longer insignificant. With the prosperity of the nation, and especially through the absorption of the Canaanites and of their holy places, ritual had become much more elaborate, and in royal sanctuaries at least there were regular public offerings maintained by the king and presented by the priests (comp. 2 Kings xvi. 15). Private sacrifices, too, could hardly be offered without some priestly aid now that ritual was more complex; the provision of Deut. xviii. as to the priestly dues is certainly ancient, and shows that besides the tribute of first-fruits and the like the priests had a fee in kind for each sacrifice, as we find to have been the case among the Phœnicians according to the sacrificial tablet of Marseilles. Their judicial functions also brought profit to the priests, fines being exacted for certain offences and paid to them (2 Kings xii. 16; Hos. iv. 8; Amos ii. 8). The greater priestly offices were therefore in every respect very important places, and the priests of the royal sanctuaries were among the grandes of the realm (2 Sam. viii. 18; 2 Kings x. 11, xii. 2); minor offices in the sanctuaries were in the patronage of the

¹ This appears even in the words used as synonyms for "priest," שֹׁמֵר הַקֶּהֱן, which exactly correspond to *sādin* and *kāhin*. That the name of כֹּהֵן was borrowed from the Canaanites appears certain, for that out of the multiplicity of words for soothsayers and the like common to Hebrew and Arabic (either formed from a common root or expressing exactly the same idea—יִרְעִי, 'arrāf; חֹזֵר, habār; חֹה; רֹאֵה, hāzi; קֶסֶם, comp. istiksām) the two nations should have chosen the same one independently to mean a priest is, in view of the great difference in character between old Hebrew and Canaanite priesthoods, inconceivable. Besides כֹּהֵן Hebrew has the word כֹּמֵר (קל. כְּמֵרִים), which, however, is hardly applied to priests of the national religion. This, in fact, is the old Aramaic word for a priest (with suffixed article, *kumrā*). Its origin is obscure, but, as it belongs to a race in which the mass of the people were probably not circumcised (Herod., ii. 104, compared with Joseph. *Ant.*, viii. 10, 3, and *C. Ap.*, i. 22) while the priests were (Dio Cassius, lxxix. 11; *Ep. Barnabas*, ix. 6; comp. Chwolson, *Sabier*, ii. 114), it may be conjectured that *kumrā* means the circumcised (Ar. *kumra*, "glans penis").

² It is not clear from 1 Sam. ii. 15 whether even at Shiloh the priest had anything to do with sacrifice, whether those who burned the fat were the worshippers themselves or some subordinate ministers of the temple. Certainly it was not "the priest" who did so, for he in this narrative is always in the singular. Hophni and Phinehas are not called priests, though they bore the ark, and so were priests in the sense of Josh. iii.

great priests and were often miserable enough,¹ the petty priest depending largely on what "customers" he could find (2 Kings xii. 7 [8]; Deut. xviii. 8). That at least the greater offices were hereditary—as in the case of the sons of Zadok, who succeeded to the royal priesthood in Jerusalem after the fall of Abiathar—was almost a matter of course as society was then constituted, but there is not the slightest trace of an hereditary hierarchy officiating by divine right, such as existed after the exile. The sons of Zadok, the priests of the royal chapel, were the king's servants as absolutely as any other great officers of state; they owed their place to the fiat of King Solomon, and the royal will was supreme in all matters of cultus (2 Kings xii., xvi. 10 sq.); indeed the monarchs of Judah, like those of other nations, did sacrifice in person when they chose down to the time of the captivity (1 Kings ix. 25; 2 Kings xvi. 12 sq.; Jer. xxx. 21). And as the sons of Zadok had no divine right as against the kings, so too they had no claim to be more legitimate than the priests of the local sanctuaries, who also were reckoned to the tribe which in the 7th century B.C. was recognized as having been divinely set apart as Jehovah's ministers in the days of Moses (Deut. x. 8, xviii. 1 sq.).

The steps which prepared the way for the post-exile hierarchy, the destruction of the northern sanctuaries and priesthoods by the Assyrians, the polemic of the spiritual prophets against the corruptions of popular worship, which issued in the reformation of Josiah, the suppression of the provincial shrines of Judah and the transference of their ministers to Jerusalem, the successful resistance of the sons of Zadok to the proposal to share the sanctuary on equal terms with these new-comers, and the theoretical justification of the degradation of the latter to the position of mere servants in the temple supplied by Ezekiel soon after the captivity, have already been explained in the article *LEVITES* and in *PENTATEUCH* (vol. xviii. p. 520), and only one or two points call for additional remark here.

It is instructive to observe how differently the prophets of the 8th century speak of the judicial or "teaching" functions of the priests and of the ritual of the great sanctuaries. For the latter they have nothing but condemnation, but the former they acknowledge as part of the divine order of the state, while they complain that the priests have prostituted their office for lucre. In point of fact the one rested on old Hebrew tradition, the other had taken shape mainly under Canaanite influence, and in most of its features was little more than the crassest nature-worship. In this respect there was no distinction between the temple of Zion and other shrines, or rather it was just in the greatest sanctuary with the most stately ritual that foreign influences had most play, as we see alike in the original institutions of Solomon and in the innovations of Ahaz (2 Kings xvi. 10 sq., xxiii. 11 sq.). The Canaanite influence on the later organization of the temple is clearly seen in the association of temple prophets with the temple priests under the control of the chief priest, which is often referred to by Jeremiah; even the viler ministers of sensual worship, the male and female prostitutes of the Phœnician temples, had found a place on Mount Zion and were only removed by Josiah's reformation.² So, too, the more complex sacrificial ritual which was now in force is manifestly not independent of the Phœnician ritual as we know it from the Marseilles tablet. All this necessarily tended to make the ritual ministry of the priests more important than it had been in old times; but it was in the dark days of Assyrian tyranny, in the reign of Manasseh, when the sense of divine wrath lay heavy on the people, when the old ways of seeking

Jehovah's favor had failed and new and more powerful means of atonement were eagerly sought for (Micah vi. 6 sq.; 2 Kings xxi.; and comp. *MOLOCH*), that sacrificial functions reached their full importance. In the time of Josiah altar service and not the function of "teaching" has become the essential thing in priesthood (Deut. x. 8, xviii. 7); the latter, indeed, is not forgotten (Jer. ii. 8, xviii. 18), but by the time of Ezekiel it also has mainly to do with ritual, with the distinction between holy and profane, clean and unclean, with the statutory observances at festivals and the like (Ezek. xlv. 23 sq.). What the priestly Torah was at the time of the exile can be seen from the collection of laws in Lev. xvii.-xxvi., which includes many moral precepts, but regards them equally with ritual precepts from the point of view of the maintenance of national holiness. The sacrificial ritual of the Priestly Code (see *PENTATEUCH*) is governed by the same principle. The holiness of Israel centres in the sanctuary, and round the sanctuary stand the priests, who alone can approach the most holy things without profanation, and who are the guardians of Israel's sanctity, partly by protecting the one meeting-place of God and man from profane contact, and partly as the mediators of the continual atoning rites by which breaches of holiness are expiated.

The bases of priestly power under this system are the unity of the altar, its inaccessibility to laymen and to the inferior ministers of the sanctuary, and the specific atoning function of the blood of priestly sacrifices. All these things were unknown in old Israel: the altars were many, they were open to laymen, and the atoning function of the priest was judicial, not sacrificial. So fundamental a change as lies between Hosea and the Priestly Code was only possible in the general dissolution of the old life of Israel produced by the Assyrians and by the prophets; and indeed, as is explained under *PENTATEUCH*, the new order did not take shape as a system till the exile had made a *tabula rasa* of all old institutions; but it was undoubtedly the legitimate and consistent outcome of the latest development of the temple worship at Jerusalem before the exile. It was meant also to give expression to the demands of the prophets for spiritual service and national holiness, but this it did not accomplish so successfully; the ideas of the prophets could not be realized under any ritual system, but only in a new dispensation (Jer. xxxi. 31 sq.), when priestly Torah and priestly atonement should be no longer required. Nevertheless, the concentration of all ritual at a single point, and the practical exclusion of laymen from active participation in it—for the old sacrificial feast had now shrunk into entire insignificance in comparison with the stated priestly holocausts and atoning rites³—lent powerful assistance to the growth of a new and higher type of personal religion, the religion which found its social expression not in material acts of oblation but in the language of the Psalms. In the best times of the old kingdom the priests had shared the place of the prophets as the religious leaders of the nation; under the second temple they represented the unprogressive traditional side of religion, and the leaders of thought were the psalmists and the scribes, who spoke much more directly to the piety of the nation.

But, on the other hand, the material influence of the priests was greater than it had ever been before; the temple was the only visible centre of national life in the ages of servitude to foreign power, and the priests were the only great national functionaries, who drew to themselves all the sacred dues as a matter of right and even appropriated the tithes paid of old to the king. The great priests had always belonged to the ruling class, but the Zadokites were now the only hereditary aristocracy, and the high priest, who now

¹ See 1 Sam. ii. 36, a passage written after the hereditary dignity of the sons of Zadok at Jerusalem was well established.

² 2 Kings xxiii. 7; comp. Deut. xxiii. 18, where "dogs"—the later Galli; comp. *Corp. Insc. Sem.*, i. 93 sq.

³ Compare the impression which the ritual produced on the Greeks, Bernays's *Theophrastus*, pp. 85, 111 sq.

stands forth above his brethren with a prominence unknown to the times of the first temple, is the one legitimate head of the theocratic state, as well as its sole representative in the highest acts of religion (comp. PENTATEUCH, vol. xviii. p. 520). When the high priest stood at the altar in all his princely state, when he poured out the libation amidst the blare of trumpets, and the singers lifted up their voice and all the people fell prostrate in prayer till he descended and raised his hands in blessing, the slaves of the Greek or the Persian forgot for a moment their bondage and knew that the day of their redemption was near (Ecclesi. i.). The high priest at such a moment seemed to embody all the glory of the nation, as the kings had done of old, and when the time came to strike a successful blow for freedom it was a priestly house that led the nation to the victory which united in one person the functions of high priest and prince. From the foundation of the Hasmonean state to the time of Herod the history of the high-priesthood merges in the political history of the nation; from Herod onward the priestly aristocracy of the Sadducees lost its chief hold over the nation and expired in vain controversy with the Pharisees. (See ISRAEL).

The influence of the Hebrew priesthood on the thought and organization of Christendom was the influence not of a living institution, for it hardly began till after the fall of the temple, but of the theory embodied in the later parts of the Pentateuch. Two points in this theory were laid hold of—the doctrine of priestly mediation and the system of priestly hierarchy. The first forms the text of the principal argument in the Epistle to the Hebrews, in which the author easily demonstrates the inadequacy of the mediation and atoning rites of the Old Testament, and builds upon this demonstration the doctrine of the effectual high-priesthood of Christ, who, in His sacrifice of Himself, truly “led His people to God,” not leaving them outside as He entered the heavenly sanctuary, but taking them with Him into spiritual nearness to the throne of grace. This argument leaves no room for a special priesthood in the Christian church, and in fact nothing of the kind is found in the oldest organization of the new communities of faith. The idea that presbyters and bishops are priests and the successors of the Old Testament priesthood first appears in full force in the writings of Cyprian, and here it is not the notion of priestly mediation but that of priestly power which is insisted on. Church office is a copy of the old hierarchy. Now among the Jews, as we have seen, the hierarchy proper has for its necessary condition the destruction of the state and the bondage of Israel to a foreign prince, so that spiritual power is the only basis left for a national aristocracy. The same conditions have produced similar spiritual aristocracies again and again in the East in more modern times, and even in antiquity more than one Oriental priesthood took a line of development similar to that which we have traced in Judæa. Thus the hereditary priests of Kozah (Κοζέ) were the chief dignitaries in Idumæa at the time of the Jewish conquest of the country (Jos., *Ant.*, xv. 7, 9), and the high priest of Hierapolis were the princely purple and crown like the high priest of the Jews (*De Dea Syria*, 42). The kingly insignia of the high priest of the sun at Emesa are described by Herodian (v. 3, 3), in connection with the history of Elagabalus, whose elevation to the Roman purple was mainly due to the extraordinary local influence of his sacerdotal place. Other examples of priestly princes are given by Strabo in speaking of Pessinus (p. 567) and Olbe (p. 672).¹ As no such hierarchy existed in the West, it is plain that if the idea of Christian priesthood was influenced by living institutions as well as by the Old Testament that influence must be sought in the East (comp. Lightfoot, *Philippians*, p. 261). The further development of the notion of Christian priest-

hood was connected with the view that the Eucharist is a propitiatory sacrifice which only a consecrated priest can perform. The history of this development is still very obscure, especially as regards its connection with heathen ideas, but something will fall to be said on it under the heading of SACRIFICE. It is sufficient to remark here that the presentation of the sacrifice of the mass came to be viewed as the essential priestly office, so that the Christian presbyter really was a *sacerdos* in the antique sense. Protestants, in rejecting the sacrifice of the mass, deny also that there is a Christian priesthood “like the Levitical,” and have either dropped the name of “priest” or use it in a quite emasculated sense.

There is probably no nature religion among races above mere savagery which has not had a priesthood; but an examination of other examples would scarcely bring out any important feature that has not been already illustrated. Among higher religions orthodox Islam has never had real priests, doing religious acts on behalf of others, though it has, like Protestant churches, leaders of public devotion (imáms) and an important class of privileged religious teachers (‘ulemá). But a distinction of grades of holiness gained by ascetic life has never been entirely foreign to the Eastern mind, and in the popular faith of Mohammedan peoples something very like priesthood has crept in by this channel. For where holiness is associated with ascetic practices the masses can never attain to a perfect life, and naturally tend to lean on the professors of special sanctity as the mediators of their religious welfare. The best example, however, of a full-blown priestly system with a monastic hierarchy grafted in this way on a religion originally not priestly is found in Tibetan Buddhism (see LAMAISM), and similar causes undoubtedly had their share in the development of sacerdotalism in the Christian church. The idea of priestly asceticism expressed in the celibacy of the clergy belongs also to certain types of heathen and especially Semitic priesthood, to those above all in which the priestly service is held to have a magical or theurgic quality. (W. R. S.)

PRIESTLEY, JOSEPH (1733–1804), was born on 13th March, 1733, at Fieldhead near Birstal, in the West Riding of Yorkshire. His father, Jonas Priestley, was a woollen-cloth dresser and apparently of very moderate means. His mother was the only child of Joseph Swift, a farmer at Shafton near Wakefield. The paternal grandfather, also named Joseph, was a churchman whose high moral character became a sacred tradition in his family. The young Joseph’s parents were Nonconformists. They had six children in eight years, and on the birth of the last, in the hard winter of 1739, the mother died. During those years Joseph lived a good deal with his maternal grandfather at Shafton. But he relates that his mother “was careful to teach him the Assembly’s Catechism,” and that, with a view of impressing on his mind “a clear idea of the distinction of property,” she on one occasion made him carry back a *pin* which he had picked up at the house of an uncle. Three years after the loss of his mother, his father’s sister, Mrs. Keighley, a lady in good circumstances, having no children of her own, took the boy to live with her.

At the age of twelve he was sent to a neighboring endowed school, where, under the tuition of a clergyman, Mr. Hague, he made rapid progress in classics, while on holidays, by way of recreation, he learned Hebrew from Mr. Kirkley, a Dissenting minister. On the removal of the clergyman Mr. Kirkley opened a school of his own, and Priestley became entirely his pupil. From the age of sixteen to nearly twenty his health was unsatisfactory, and he attended neither school nor college, but still continued his studies in private with occasional assistance. It was thought that his constitution would be better adapted to an active than to a sedentary life, and with a view to commerce he learned French, Italian, and German

¹ See also Mommsen, *Hist. of Rome*, Eng. trans., iv. 150.

without assistance. But the aunt, Mrs. Keighley, had set her heart on making a minister of him, and young Priestley's own aspirations took the same form. When, therefore, his health improved, the offer of a mercantile situation in Lisbon was surrendered, and Priestley in his twentieth year (1752) was sent to Daventry, where there existed a Nonconformist academy, originally founded by Dr. Doddridge at Northampton, and removed after his incapacitation by illness or on his death in 1751.

There is no mention of any hesitation on the part of Priestley or his friends as to whether he should enter the established church or not. But there was certainly nothing in his theological creed at this period to have prevented his taking orders. The hindrance, therefore, must have been his adherence to the Nonconformist tradition on questions of ecclesiastical polity and ritual. There were, however, in his early associations some elements which not only help to explain his after career but throw a curious light on the fluid condition of Nonconformist denominations in those days as compared with their sectarian fixedness now. He was brought up in the principles of Calvinism. But he tells us his aunt's house "was the resort of all the Dissenting ministers in the neighborhood without distinction; and those who were most obnoxious on account of their heresy were almost as welcome to her, if she thought them honest and good men—which she was not unwilling to do—as any others." Notwithstanding the comparative freedom of the conversations to which he listened, young Priestley at seventeen was strictly orthodox, and anxiously endeavored to realize the experiences he supposed to be necessary to conversion. His chief trouble was that he could not repent of Adam's transgression, a difficulty he never surmounted. The pressure of this impossibility forced his candid mind to the conclusion that there must be a mistake somewhere, and he began to doubt whether he was really so much entangled in Adam's guilt as he had been taught. Accordingly he was refused admission into the communion of the Independent church which his aunt attended. His adhesion to Calvinism was now considerably relaxed. But this did not interfere with his entrance at Daventry. Dr. Doddridge had not confined his educational aims to students for the ministry, and he not only refused to impose theological tests but he incurred reproach by resolutely refusing to press his own orthodox creed on the heterodox pupils occasionally received. Priestley's intellectual preparation previous to his entrance is noteworthy. Besides being a fair classic, he had improved his Hebrew by giving lessons in that language. He had acquired three modern languages. He had "learned Chaldee and Syriac, and just begun to read Arabic"; nor was he disproportionately backward in mathematics. He had also mastered Gravesande's *Elements of Natural Philosophy*, and various text-books of the time in logic and metaphysics. It cannot surprise us that he "was excused all the studies of the first year and a great part of those of the second." At Daventry he stayed three years taking a prominent part in the singularly free discussions that seem to have formed a considerable part of the academical exercises. "In this situation," he says, "I saw reason to embrace what is generally called the heterodox side of almost every question." His chief tutors were Dr. Ashworth of conservative and the Rev. Samuel Clark of decidedly liberal tendencies. Priestley's speculations at this time were philosophical rather than scientific. Under the influence of Hartley's *Observations on Man* and Collins's *Philosophical Enquiry* he exchanged his early Calvinism for a system of "necessarianism,"—that is, he learned to hold that the invariable connection of cause and effect is as inviolable in the moral as in the material world. During these early years he began his enormous industry as a writer, and in particular laid down the lines of his *Institutes of Natural and Revealed Religion*.

From Daventry he went in 1755, at twenty-two years of age, to take charge of a small congregation at Needham Market in Suffolk. This church was halting between Presbyterianism and Independency, being subsidized by both. Priestley insisted on dropping the Independent connection. As a consequence he had to content himself with a salary of £30, and succeeded in living on less. His studies had not in the least chilled his devotion to the sacred work, which indeed to the end of his life he counted his highest honor. He was diligent in preaching and teaching, but his intellectual freedom, together with a physical difficulty in speech, prevented his attaining popularity. To cure the defect in speech he paid twenty guineas, given him by his aunt, to a London specialist or quack. But this difficulty turned out to be as irremediable as his intellectual unconformability; and the only permanent advantage derived from his visit to the metropolis was an introduction to various scholars of the day, such as Dr. Price, also Dr. Benson and Dr. Kippis, friends of Lardner. Later on he made the acquaintance of the last also through some manuscript notes on the doctrine of atonement, which attracted the great scholar's attention.

In 1758 Priestley removed to Nantwich, obtaining a more congenial congregation; and there he established a school, which increased his income but lessened his literary activity. Always bringing his best intelligence to bear on everything he undertook, he varied his elementary lessons with instruction in natural philosophy, illustrated by experiments, for which he could now afford the needful instruments. "These," he says, "I taught my scholars in the highest class to keep in order, and to make use of; and by entertaining their parents and friends with experiments, in which the scholars were generally the operators, and sometimes the lecturers too, I considerably extended the reputation of my school." Up to this time his studies had been entirely literary and theologico-philosophical. It is noteworthy that his efforts to liberalize education turned his attention to science. He was probably one of the very first teachers to appreciate the importance of physical science to early culture.

In 1761 he was appointed classical tutor in a Nonconformist academy, then recently established at Warrington on the same liberal principles as the institution at Daventry. In this position he passed six of his happiest years, pursuing his scientific studies, especially in chemistry and electricity, enjoying congenial intercourse with Dr. Turner of Liverpool, also with Wedgwood's partner Mr. Bentley, Dr. Enfield, and various Manchester men whose sons or grandsons helped to form the "Manchester school." In 1762 he married the daughter of Mr. Isaac Wilkinson, an ironmaster of Wrexham. At Warrington Priestley received the complimentary degree of LL.D. from Edinburgh, apparently in recognition of his *Chart of History*. On a visit to London he made the acquaintance of Dr. Franklin, and his researches in electricity procured him election to the Royal Society in 1766.

In the following year (1767) Dr. Priestley removed to Leeds to take charge of Mill Hill chapel; and in the same year was published his *History of Electricity*, a work suggested by Dr. Franklin, and contributing greatly to the author's fame. Now, however, he turned once more to speculative theology, and surrendered the Arianism he had hitherto loosely held, adopting instead definite Socinian views. In addition to preaching and teaching diligently in his congregation he carried on his chemical researches with results considered at the time startling. Chemistry was hardly in its infancy; it was unborn. "The vast science," says Mr. Huxley, "which now passes under that name had no existence." Living next door to a brewery Dr. Priestley amused himself with experiments on the "fixed air" (carbonic acid) produced there, and succeeded in forcing it into water. Thus commenced his researches on "different kinds of air" remarkable

rather for the impulse they gave to controversy and experiment than for any mature scientific results. He had a keen instinct for surmise, but no adequate method of research and verification. On this point Roscoe and Schorlemmer observe in their treatise on *Chemistry* (vol. i. p. 18) that "Priestley's notion of original research, which seems quite foreign to our present ideas, may be excused, perhaps justified by the state of science in his day. He believed that all discoveries are made by chance, and he compares the investigation of nature to a hound, wildly running after, and here and there chancing on game (or, as James Watt called it, 'his random haphazarding'), whilst we would rather be disposed to compare the man of science to the sportsman, who having, after persistent effort, laid out a distinct plan of operations, makes reasonably sure of his quarry." At this time also he wrote various political tracts and papers, always in favor of popular rights, and in particular hostile to the attitude of the Government towards the American colonies.

In 1771 he was nearly appointed to accompany Captain Cook to the South Seas. But the Government of the day was shocked at the idea of giving official position to a Socinian minister, and Priestley was disappointed. Shortly afterwards he accepted the somewhat anomalous situation of "literary companion" and librarian to Lord Shelburne. With this nobleman he travelled in Holland and Germany, returning by Paris, where he spent a month in 1774. The position gave him ample leisure for his scientific and literary pursuits. But on the completion of his most noteworthy philosophical treatise, *Disquisitions on Matter and Spirit*, the connection was dissolved. It has been surmised that the patron feared to share the unpopularity of his client's views. Those views Priestley himself considered to be "materialistic." It is a question of words. Seeing that he denied impenetrability to matter, it is difficult to say why the substance he left might not as well be called spirit as anything else.

In 1780 he removed to Birmingham, where he enjoyed the friendship of James Watt and his partner Boulton, also of Dr. Darwin, grandfather of the illustrious man in whom the honors of the name culminated. Here Dr. Priestley again took charge of a congregation, and resumed his theological efforts in a controversy with the bishop of Waterford, and in a laborious *History of the Corruptions of Christianity*. But bad times were at hand. The French Revolution excited passionate controversy, and Priestley was naturally on the side of the revolutionists. In 1791 the anniversary of the capture of the Bastille was observed in Birmingham by a dinner at which he was not present, and with which he had nothing to do. But the mob wished to testify by some signal deed their abhorrence of the un-English notions propounded at the dinner, and therefore burned down Priestley's chapel and house. Before the deed was done they waded knee deep in torn manuscripts, and amused themselves with futile efforts to make an electric machine avenge its owner's impiety by firing the papers with a spark. The blow was a terrible one. Priestley and his family had escaped violence by timely flight, but every material possession he valued was destroyed and the labors of years annihilated. But neither despair nor bitterness possessed him. He left Birmingham, and for three years preached in Hackney, then a suburban village, and in 1794 he went out to the young States whose cause he had advocated to spend the last ten years of his life in the land of the future. He resided at Northumberland in Pennsylvania, eager as ever for controversy and research. His materialism, so-called, never dimmed his hope of immortality. His religion to the end was characterized by a childlike simplicity of spirit. On his deathbed he would have his grandchildren to kneel by his side for their daily prayers, and listened with pleasure to the hymns they lisped. On the 6th of February, 1804, he clearly and audibly dictated a few

alterations he wished to make in some of his publications. "That is right," he said, "I have now done"; and within an hour he quietly expired.

The interest of Dr. Priestley's life lies not so much in any splendid achievements, either literary or scientific, but rather in the character of the man. His career also affords a typical illustration of the mutual relation and interaction of several great factors of human progress at a very critical period. As a Non-conformist minister, born into a Calvinistic circle, educated in an Independent academy, developing into a Socinian divine, yet maintaining always the most friendly relations with clergymen, priests, and orthodox ministers, he gives us a curious insight into the condition of English religion just before its sectarian divisions had hardened into their modern form. As a pioneer in the investigation of gases and the discoverer of oxygen he helped—but, it must be admitted, as often by his mistakes as by his successes—to erect chemistry into a science. As a professed materialist whose doctrines seemed at the same time to merge matter in force he, amongst others, prepared the way for the modern agnosticism, which declines to look behind phenomena. As a politician he anticipated nineteenth-century radicalism. In general, as an exceptionally single-eyed and fearless searcher after truth he bore the brunt of persecution by vulgar ignorance, and in his disappointments illustrated how little can be practically accomplished by isolated enlightenment apart from popular education.

The works of Dr. Priestley, as collected and edited by John Towill Rutt, fill twenty-five octavo volumes, one of which, however, consists of memoirs and correspondence. The date of this collected edition is 1832. It contains upwards of 130 separate works, varying in size from brief pamphlets to treatises in four volumes, and his labors range over almost all possible subjects of human knowledge or speculation. Mathematics, chemistry, physiology, grammar, logic, mental and moral philosophy, history, theology, interpretation of prophecy, politics, and sociology, all alike furnished themes for Priestley's untiring pen, and if he did not write on any of them with striking originality he treated all with freedom and intelligence. In 1761 he issued his first published works, a treatise on the *Scripture Doctrine of Remission* and *The Rudiments of English Grammar*. From that date till 1767 he was content with publishing something every alternate year. But from 1767 to 1804 he allowed only two years to go by unmarked by one or more publications, many of them remarkable as monuments of conscientious and laborious industry. His first scientific work, *The History and Present State of Electricity, with Original Experiments*, was published in 1767. The rapid advance of science has left to this and similar works of his little more than an antiquarian interest. But the treatise illustrates his prophetic spirit, inasmuch as it shows how far he was in advance of his contemporaries in appreciation of the prospects of physical research. In 1774 he issued his first volume of *Experiments and Observations on Different Branches of Air, etc.* In this volume he announced his discovery of "dephlogisticated air," now known as oxygen. The then prevalent theory of *phlogiston*, or the combustible principle in matter, betrayed him into great confusion, evident enough in the very name he gave to his new "branch of air." Nevertheless it is said of him in Roscoe and Schorlemmer's *Chemistry* (vol. i. p. 16) that "no one obtained more important results or threw more light upon the chemical existence of a number of different gases than Joseph Priestley." These *Experiments and Observations* were continued through five volumes, of which the last appeared in 1780. Perhaps the limit of Priestley's power of growth is illustrated by the persistency with which he clung to *phlogiston* notwithstanding the discoveries of Black, Lavoisier, and Cavendish. In 1800 he issued a treatise called *The Doctrine of Phlogiston established, and that of the Composition of Water refuted*. In a letter of that year to the Rev. T. Lindsay he says, "I have well considered all that my opponents have advanced, and feel perfectly confident of the ground I stand upon. In this definite treatise I insert all that is contained in my former publications on the subject, with many new experiments. Though nearly alone, I am under no apprehension of defeat." Dr. Priestley clearly failed to appreciate the progress of the science he had done so much to promote. But the attempt made by Lavoisier to claim for himself a concurrent discovery of oxygen at the same time as Priestley's was certainly unjustifiable. This achievement, together with the first pre-

paration of nitric oxide, nitrous oxide, hydrochloric acid, and other important gases, constitutes the true ground of his fame as a scientific pioneer (see Roscoe and Schorlemmer, *l.c.*).

Priestley's chief theological works were the *Institutes of Natural and Revealed Religion*, *A History of the Corruptions of Christianity*, and *A General History of the Christian Church to the Fall of the Western Empire*. Bishop Horsley's criticisms on the second of these works produced letters in reply, "with additional evidence that the primitive church was Unitarian." His principal metaphysical writings were *Disquisitions relating to Matter and Spirit* and various essays and letters on necessitarianism. A complete list of his works will be found in vol. i. part ii. of Rutt's collected edition.

(J. A. P., JR.)

PRIM, JUAN, MARQUIS DE LOS CASTILLEJOS, COUNT DE REUS (1814-1870), Spanish soldier and statesman, was the son of Lieutenant-Colonel Pablo Prim, and was born at Reus in Catalonia on 12th¹ December, 1814. He entered the free corps known as the volunteers of Isabella II. in 1834 and greatly distinguished himself throughout the Carlist War, in the course of which he rose to the rank of lieutenant-colonel and had two orders of knighthood conferred upon him. After the pacification of 1839 he entered political life, and as a progressist opposed to the dictatorship of Espartero he was sent into exile. However, in 1843 he was elected deputy for Tarragona and issued a pronunciamento against Espartero at Reus; and after defeating Espartero at Bruch he entered Madrid in triumph with Serrano. The regent Maria Christina recognized his services, promoted him to the rank of major-general, and made him count of Reus. Prim now looked forward to peace under a settled constitutional monarchy, but Narvaez, the prime minister, failed to understand what constitutional freedom meant, and Prim, on showing signs of opposition, was sentenced to six years' imprisonment in the Philippine Islands. The sentence was not carried out, and Prim remained an exile in England and France until the amnesty of 1847. He then returned to Spain, but kept aloof from politics, and was first employed as captain-general of Porto Rico and afterwards as military representative of Spain with the sultan during the Crimean War. In 1854 he returned to Spain on being elected to the cortes, and gave his support to O'Donnell, who promoted him to be lieutenant-general in 1856. In the war with Morocco, at the head of his division, he did such good service at Los Castillejos or Marabout, Cabo Negro, Guad al Gelu, and Campamento in 1860 that he was made marquis de los Castillejos and a grandee of Spain. He next commanded the Spanish expeditionary army in Mexico, when he acted in exact accordance with the treaty of London and refused to consent to the ambitious schemes of Napoleon III. On his return to Spain he joined the opposition, heading pronunciamentos in Catalonia against Narvaez and O'Donnell. All his attempts failed until the death of Narvaez in April, 1868, after which Queen Isabella fell more and more under the influence of the Jesuits, and became increasingly tyrannical, until at last even Serrano was exiled, and more than 10,000 persons, including every journalist of position, were in prison. In September, 1868, Serrano and Prim returned, and Admiral Topete, commanding the fleet, raised the standard of revolt at Cadiz. For the public events of the subsequent ten months the reader is referred to the article SPAIN. In July, 1869, Serrano was elected regent, and Prim became president of the council and was made a marshal. On 16th November, 1870, Amadeo, duke of Aosta, was elected king of Spain, but Prim was not destined to receive the new monarch, for on leaving the chamber of the cortes on 28th December he was shot by unknown assassins and died two days later. The cortes at once declared that he had deserved well of his native land, and took his children as wards of the country; three

days afterwards King Amadeo I. swore in the presence of the corpse to observe the new Spanish constitution.

Two biographies of Prim down to 1860 were published in that year by Gimenez y Guitéd and Gonzalez Llanos; see also L. Blairet, *Le Général Prim et la situation actuelle de l'Espagne*, Paris, 1867, and Guillaumot, *Juan Prim et l'Espagne*, Paris, 1870.

PRIMATE (*primas*, i.e., *primus*), a title more than once bestowed in the *Codex Theodosianus* on various civil functionaries, came about the beginning of the 4th century to be used also, especially in Africa, as a designation of the "primæ sedis episcopus." In the canon law the word "primate" is regarded as essentially the Western equivalent of the Eastern "patriarch." See ARCHBISHOP and PATRIARCH.

PRIMOGENITURE. The term "primogeniture" is used to signify the preference in inheritance which is given by law, custom, or usage to the eldest son, and his issue, or in exceptional cases to the line of the eldest daughter. The practice prevailed under the feudal codes throughout all the Western countries. It is now almost entirely confined to the United Kingdom, having been abolished (except in the succession to the crown) by the various civil codes which have superseded feudalism on the Continent, and having been universally rejected in the United States of America as being contrary to the spirit of their institutions. The system has of late years been persistently attacked in Great Britain, chiefly on the ground of hardship in cases of intestacy where the property is small; but the rule was found to operate so successfully in former times towards keeping large properties together that it seems likely to be still maintained by law; and even if abolished as a rule of law it would most probably be maintained in full vigor as a habit or rule of practice.

In dealing with the whole subject it will be convenient to state in the first place the nature of the rules of primogeniture as they now exist in England, with some notice of the exceptional usages which illustrate the meaning and origin of the system, and in the second place to give an account of those archaic customs in which we may find the actual origin of primogeniture before it was altered and extended by the policy of the feudal sovereigns, and by traditional usages which governed their succession to the throne. The English law provides that in ordinary cases of inheritance to land the rule of primogeniture shall prevail among the male children of the person from whom descent is to be traced, but not among the females; and this principle is applied throughout all the degrees of relationship. There are exceptions to this rule in the gavelkind lands of Kent, where all the males take equally in each degree, in the burgage tenements of certain ancient boroughs, where the descent is to the youngest son under the custom called "borough-English," and in the copyhold lands of a great number of manors, where customs analogous to those of gavelkind and borough-English have existed from time immemorial. In another class of exceptions the rule of primogeniture is applied to the inheritance of females, who usually take equal shares in each degree. The necessity for a sole succession has, for example, introduced succession by primogeniture among females in the case of the inheritance of the crown, and a similar necessity led to the maxim of the feudal law that certain dignities and offices, castles required for the defence of the realm, and other inheritances under "the law of the sword" should not be divided, but should go to the eldest of the co-heiresses (Bracton, *De Legibus*, ii. c. 76; Co. Litt., 165a). In the case of dignities the rule of sole succession is adopted without reference to the right of primogeniture, the dignity lying in abeyance until the line of a particular co-heiress is selected by the sovereign as "the fountain of honor." Another exceptional usage gives a preference to the line of the eldest daughter in the inheritance of customary holdings in

¹ [E. Baret gives 6th December as date of birth, as do other authorities. *Biographie Générale*.—AM. ED.]

the Isle of Man, in various lordships in Cumberland, Westmoreland, and Durham, as well as in isolated manors in Surrey and Sussex, and in other parts of the southern and midland counties. At Tynemouth in Northumberland it was the custom that the eldest daughter surviving her parents should inherit her father's estate for her life, and in some of the southern manors already mentioned the rule of primogeniture among females is not confined to daughters but is extended to the eldest sister or aunt, or even to female relations in more remote degrees. There are many other special customs by which the ordinary rules of descent are varied according to manorial usage, as that the youngest son shall inherit if the father dies seised, but otherwise the eldest, or that fee-simple shall go to the youngest and entailed land to the eldest, or that the special custom shall only affect lands of a certain value (as is said to be the usage in several manors near London), or that male and female issue should share together (as formerly was the practice at Wareham and Exeter and in certain other ancient boroughs, as well as in some of the copyholds belonging to the see of Worcester), or that the eldest or the youngest should be preferred among the daughters in the claim to a renewal of a customary estate for lives, with other analogous variations.

It will be seen that the English law of inheritance creates a double preference, subject to the exceptions already mentioned, in favor of the male over the female and of the first-born among the males. This necessitates the rule of representation by which the issue of children are regarded as standing in the places of their parents. This is called "representative primogeniture." The rule appears to have been firmly established in England during the reign of Henry III., though its application was favored as early as the 12th century throughout the numerous contests between brothers claiming by proximity of blood and their nephews claiming by representation, as in the case of King John and his nephew Prince Arthur (Glanville, vii. c. 3; Bracton, *De Legibus*, ii. c. 30). We must now describe some of those ancient usages in which the origin of primogeniture is to be sought.

In addition to the rule of eldership as applied to inheritances of land there are traces of a multitude of customs which applied a similar rule to certain classes of "principals" or heirlooms, such as the best bed or piece of furniture, or horse and cart, and the like, which descended to the eldest son; and by a similar rule of the common law the ancient jewels of the crown are heirlooms which descend to the successor according to the rule of primogeniture. In the district of Archenfield near the Welsh border the house and lands were divided between the sons on their father's death, but certain "principals" passed to the eldest as heirlooms, such as the best table and bed, "all of which the men of Archenfield retained as derived to them from great antiquity, even before the Norman Conquest" (Quo Warranto Roll, 20 Edw. I., "Irchinfield"). A similar usage existed in some of the lands in Sussex belonging to Battle Abbey; and by the custom of the hundred of Stretford in Herefordshire the eldest son was entitled to keep the best article of every kind of chattel, as the best of the chests and cups, or the best table and chair (Co. Litt., 18b). This right resembles in many respects the privilege of the youngest co-heir to take the hearthplace or *covert del astre*, which formerly prevailed in the gavelkind lands of Kent according to the Kentish custumal, and privileges of the same kind which were customary in the district round Amiens and in many parts of Flanders under the tenures called "maineté," "quévaise," and "madalstad" (Bouthors, "Coutûmes Locales du Bailliage d'Amiens," *Cout. Gén.*, i. 699, ii. 901). This exceptional law does not seem to have prevailed in Scotland or Ireland; but in the Shetland Islands it appears to have been the custom, as also in several of the Continental instances, that the young-

est child of either sex should have the house when the property came to division. Similar benefits were reserved to the youngest son by the Welsh laws, which provided that when brothers divided a patrimony containing a habitation "the youngest should have the principal messuage and all the buildings and eight acres of land, and the hatchet, the boiler, and the ploughshare," and a preference of the same kind prevailed in some parts of Devon and Cornwall and in very extensive lordships in Brittany. Traces of the same or analogous usages may be found in many parts of Germany, Switzerland, Russia, Hungary, and other countries.¹

The custom of giving a preferential birthright to the eldest son or child did not prevail so extensively in ancient times, though it was known in some parts of Germany as well as in France, where it is called "le préciput." The eldest son or eldest child got the house and a piece of furniture and a plot of land "as far as a chicken could fly," as being traditionally exempt from the general partition. In the *Ordinances* of St. Louis we find a rule that a gentleman having daughters only should divide the rest of his property equally among them, "mais l'aînée outre sa portion aura la maison paternelle et le vol du chapon."

Instances of this kind are found among the rural customs of England and Normandy, which serve to indicate the source of one part at least of the English system of primogeniture. The rights of the eldest, however, have been collected from many quarters. Sir Henry Maine has traced the modern form of this system to the growth of the power of the chieftain and its development in feudal times. The mediæval jurists are responsible for many exaggerations of the principle of sole succession to rights of dominion. But it is at any rate important to observe that there were Teutonic customs giving a benefit of eldership before the feudal system was invented, which appear to have much less connection with the power of the patriarch or chieftain than with the sentiment that gave the father's house to the eldest son under the Athenian law or secured to him a larger set of rights under the *Laus of Manu* (Demosth., *Pro Phorm.*, 34; Coulanges, *Cité Antique*, c. 6). It should also be remembered that at least one tribe of Germans was accustomed in the days of Tacitus to allow the father's war-horse to descend as an heirloom or "principal" to the eldest son (*Germ.*, cc. 18, 20, 32), and that the strict rule of primogeniture appears to have existed in Scandinavia from the most ancient times. To the English instances already mentioned may be added a passage from Bede's life of St. Benedict which shows that some substantial birthright was reserved in his time for the eldest son, when a patrimony had to be divided according to the Northumbrian laws, "*Quomodo terreni parentes, quem primum fuderint, eum principium liberorum suorum cognoscere et cæteris præferendum ducere solent*" (Bede, *Vit. Bened.*, s. 11). This may refer to some system of double portions, like the Jewish rule as to "birthright" (Deut. xxi. 15, 16), or it may denote a preference in partition which secured the dwelling-house or principal chattels to "the first-fruits of the family." A passage from Glanville, which is applicable to England and Scotland in the 12th century, shows that in the case of a rustic holding the custom of the district determined whether it should be divided among all the sons or reserved for the eldest or youngest. "If he were a free sokeman, the inheritance in that case will be divided among all the sons according to their number in equal shares, if the holding was partible by ancient custom, the chief messuage being, however, reserved for the first-born son in honor of his seniority, but on the terms of his making compensation to his brothers from the rest of his property. But if it was not anciently partible, then by the custom of

¹ Reports on *Tenure of Land*, 1869; Grimm, *Deutsche Alterthüm.*, 475; Wenckebach, *Jus Theodactum Redivivum*, 1759; Kövy, *Summ. Juris Hungarici*, 351; Mesökövesel, *Les Bachkirs*, etc., iii. 81.

some places the first-born son will take the whole inheritance, but by other customs the youngest son is the heir" (Glanville, vii. c. 3). In the time of Bracton, a century later, the presumption that primogeniture was an exceptional rule had been reversed, and special proof was required in freehold lands of a custom to exclude the eldest. He still speaks, however, of customs in favor of the eldest or youngest son in the case of the "villein-socage" holdings, which afterwards developed into copyholds. "When a free sokeman dies leaving several heirs to share, if the inheritance is partible from ancient times, they shall all have their equal shares; and if there is only one message that shall remain entire for the eldest, but so that the others shall have up to its value out of the common stock. But if the inheritance has not been divided from ancient times then it shall remain to the eldest. But if it be villein-socage then the custom of the place is to be observed, for it is the usage in some parts for the youngest to be preferred to the eldest, or the contrary" (*De Leg.*, ii. c. 76). The ancient rule of inheritance among socage tenants in Scotland was the same as that described by Glanville.

These customs of "rural primogeniture" can be traced, as we have seen, in some parts of the Continent, but their existence is rarely to be distinguished where the influence of the Roman law prevailed in the barbarian kingdoms, as in Italy, Spain, and Provence. In Normandy and Picardy, however, these usages long remained in an exceptionally vigorous form,—a fact which may be due to the Scandinavian origin of the Normans, or perhaps, as Richebourg suggested in his note on the *Coutume de Caux*, the custom may have lasted down as a tradition from Gaulish times. The laws of the Channel Islands still preserve a special benefit for the eldest son; but the *Coutumier Général* affords several examples of a more ample birthright which can hardly be attributed to any feudal influence. By the custom of Normandy "the eldest son in right of his eldership might take and choose as a *préciput* such fief or *terre noble* as he pleased; and if there were but one *manoir roturier* on the land the eldest before the division might declare that he retained it with court and garden, making recompense to his younger brothers" (*Coutume de Normandie*, 337, 356). "L'ainé faisait partage . . . peut retenir par précipu le lieu chevels . . . anciennement appelé hébergement, soit en ville ou en champs, de quelque estendue qu'il soit" ("Usage de Bayeux," *Cout. Gén.*, iv. 77, 78, 94). The usage of the district of Caux, on the frontier of Picardy, was even more favorable to the eldest son: "Demeurant le manoir et pourpris en son intégrité au profit de l'ainé sans qu'il en puisse être disposé à son préjudice, ny qu'il soit tenu en faire récompense ausdits puînés" ("Succ. Bailliage de Caux," *ibid.*, 74).

This last instance appears to give us a clue to the origin of the strict English primogeniture as applied to the rustic holdings, sometimes called *fiefs de roturier* or "ploughman's fee," which in most parts of the Continent, as in almost every district in England before the Norman Conquest, descended to all the sons in equal shares, with some customary privilege or birthright in favor of the eldest or youngest son. The strict rule of the custom of Caux was deliberately applied by the Norman kings of England not only to military fiefs but also (wherever it was possible) to agricultural tenancies. This was effected partly by reversing the presumption of partibility, as shown by the passage from Bracton cited above, and partly by direct enactments of the king or of his greater tenants, who assumed or received the prerogative of abolishing inconvenient modes of inheritance. The urban customs of the "French" portions of Hereford and Nottingham appear to have been altered in this way. (See MUNICIPALITY.) Simon de Montfort, by his charter in 1255, granted to the burgesses of Leicester that the eldest son should be his father's heir instead of the

youngest; and an analogous right was exercised under the name of "disgavelling" by the archbishop of Canterbury in Kent. About the reign of Edward II. the idea first began to prevail that such alterations of descent could not be carried out without the consent of parliament, and it was eventually held that even the king had no such prerogative (Robinson, *Gavelkind*, i. c. 5). The earlier view is very clearly stated in a charter by which Edward I. disgavelled certain lands of John de Cobham (Charter Rolls, 4 Edw. I., No. 17). The most important clauses of this document were in effect as follows:

"It pertains to our prerogative to abolish such laws and customs as diminish instead of increasing the strength of the kingdom, or at least to change them by our special favor in the case of our deserving and faithful followers; and since it has often happened by the Kentish custom that lands, which when undivided in certain hands are quite sufficient for the service of the state and the maintenance of many, are afterwards divided and broken up among co-heirs into so many parts and particles that no one portion suffices even for its owner's maintenance, we therefore grant to J. de Cobham that all the gavelkind lands and tenements which he now holds in fee simple shall descend to his eldest son or other heir at common law in the same way as his estates held by serjeanty or knight-service."

A similar change of tenure was effected by Acts of parliament for many estates in Kent in 11 Hen. VII., 15 Henry VIII., 31 Hen. VIII., 2 and 3 Edw. VI., 1 Eliz., 8 Eliz., and 21 James I., and primogeniture was introduced in the same way into the soke of Oswaldbeck in Nottinghamshire in 32 Hen. VIII. and into the city of Exeter by the Act of 23 Eliz. c. 12. The customary descent of copyhold lands (where primogeniture had not been established in ancient times by the ordinances of the lords or by an application of the current presumption) has been changed in a great number of cases by other private Acts of parliament or has been destroyed by enfranchisement. The Welsh custom of partition was altered in some respects, especially by forbidding the inheritance of bastards, by the Statute of Wales passed in the 12th year of Edward I.; the custom as modified was confirmed when the principality was united in 27 Hen. VIII. to the kingdom of England, but it was soon afterwards enacted by the Act 34 and 35 Hen. VIII. c. 26 that freehold lands in Wales should thenceforth be "holden as English tenure to all intents according to the common laws of this realm of England, and not be partible amongst heirs-male after the custom of gavelkind as heretofore in divers parts of Wales was used and accustomed." The change in the Irish customs was carried out in a different way. There is evidence that before the adoption of the English law several systems of customary inheritance were known in Ireland. Besides the law of tanistry, which will be described afterwards, there are indications in the Brehon tracts not only of arrangements in favor of the youngest branch, such as have been already mentioned, but also of a preference in some cases for the eldest son, "the cattle and land being equally divided, but the house and offices going in addition to his own share to the eldest son" (Hearn, *Aryan Household*, 80, 82; O'Curry, *Lectures*, clxxix.). Besides these cases we have the record of that system of "Irish gavelkind" which was described by Spenser and Davis, and which has been shown by Sir H. S. Maine to be closely connected with very early Aryan institutions still surviving in practice among the Hindus.

"The lands in that kingdom possessed by the mere Irish were divided into several territories or countries, and the inhabitants of every Irish 'country' were divided into several septs or lineages, in every one of which there was a chief called *Canfinny* or '*caput cognationis*,' and all the inferior tenancies in these territories were partible among the males in gavelkind; but the estate which these inferior tenants had was not an estate of inheritance, but a temporary or transitory possession, for these lands were not partible among the next heirs of him that died, but among all the males of this sept or clan in this manner: the *Canfinny* (who

was generally the oldest man in the sept) made all these partitions according to his discretion. This *Canfinny*, after the death of every one who had a competent portion of land, assembled all the sept and having put all their possessions into hotchpot made a new partition of the whole; in which partition . . . he allotted to every one of the sept according to his age a better or larger part" (Robinson, *Gavelkind*, i. c. 2; Davis's *Reports*, 37, "Case of Tanistry").

This is obviously the description of a joint family similar to those which have been found in the Scottish Highlands, in France, in the Slavonic countries, and in India, and, as it would seem, the various modes and periods of redistributing such joint possessions are merely matters of detail and convenience. It would be of greater importance to our subject to know whether any special property was reserved for one of the dead man's sons, as in the case of the Frisian "theel-lands." It was resolved in the great case of tanistry in the third year of James I. that this Irish "custom of gavelkind" was void in law as being unreasonable and as being "a mere personal custom" not binding the descent of the inheritance, "and therefore all the lands in these Irish territories were adjudged to be descendible according to the course of the common law, notwithstanding the Irish usage." By one of the penal statutes against Roman Catholics in Ireland (2 Anne c. 6), the usage of partibility was to some extent revived, it being enacted that the lands of Roman Catholics should be divided among all the sons "as in gavelkind," unless the heir should be a Protestant; but this harsh law was fortunately repealed by the Irish Act of 18 Geo. III. c. 49.

The remote origin of all these ancient forms of primogeniture may probably be traced to a system of family religion that prevailed among the tribes from which the Aryan nations have descended. We are told in the *Laws of Manu* that the eldest son had his very being for the purpose of accomplishing the rites of the family religion, of offering the funeral cake, and of providing the repasts for the spirits of the dead ancestors. "The right of pronouncing the prayers belongs to him who came into the world the first. A man must regard his elder brother as equal to his father. By the eldest at the moment of his birth the father discharges his debt to his own progenitors; the eldest son ought therefore before partition to manage the whole of the patrimony" (*Laws of Manu*, ix. 105, 126; Coulanges, *La Cité Antique*, c. 6, "La Droit d'Aînesse"). This view seems to account for the widespread usage that the eldest son should keep the house, or hearthplace, or the parents' furniture as part of his share of the inheritance. It is said that among the Hindus the right to inherit a dead man's property is exactly coextensive with the duty of performing his obsequies, and we are told that in ancient Rome an inheritance could not be distributed under a will "without a strict apportionment of the expenses of these ceremonies among the different co-heirs" (Maine, *Anc. Law*, 191). Some support is also given to this theory by the custom which is said to have prevailed in Norway by which particular lands were set apart for funeral expenses, and if a man had no kinsman to give him proper burial he might leave his property as "brande-erbe" or "burning-land" as an endowment for burial, and the friend who accepted the duty was allowed to keep the property as "odal land" or privileged family inheritance (Robertson, *Early Kings*, ii. 323). Numerous other illustrations might be given from the analogous customs in which the youngest son is preferred. There seems to be no reason why the eldest should be preferred by one nation and the youngest by another; but something may perhaps be due to the accident that the one set of tribes was civilized enough to have fixed family habitations, and the other may have lived in a nomad fashion, so that the youngest would be most likely to remain in the parents' tent and to be ready to perform the duties of the hearthplace. Sir Henry Maine draws

a distinction between the archaic customs of the tribe and that strict form of primogeniture which he has traced to the power of the chieftain. Taking primogeniture in the sense of an exclusive succession of the eldest son to property, he finds no sign of its existence before the destruction of the Roman empire by the barbarians. "Even when the Teutonic races spread over western Europe they did not bring with them primogeniture as their ordinary rule of succession." He considers the "birthright" given to the eldest in the instances which have been mentioned to be in the nature of a reward or a security for impartial distribution (*Early Hist. Inst.*, 197, 198). Primogeniture, as we know it in our law, had rather a political than a civil origin, and comes from the authority of the feudal lord and probably from that of the tribal chief; but here and there on the Continent there are traces of it as a civil institution, and in such cases the succession of the eldest son does not exclude provision for the younger sons by what are called appanages. The evidence of ancient law and usage would, however, seem to show that it was usually the youngest son who remained at home with his father to serve him through life and succeed to his remaining property at his death" (*Early Law and Custom*, p. 260).

As regards the political origin of a great part of the English system of primogeniture a distinction should be made between royal and feudal successions. The devolution of the crown in European countries has usually been regulated by some kind of primogeniture, based partly on the rules which have governed private successions, partly on the indivisible character of the empire as it survived into modern times, and partly again on that "law of the sword" or rule of public policy which forbids the disintegration of the state. It is possible also that the Irish system of tanistry contained some of the elements of this method of royal succession. The custom was described by Spenser in his *View of the State of Ireland* shortly before the abolition of the Brehon law in the reign of James I. as follows: "It is a custom among all the Irish that, presently after the death of any of their chief lords, or captains, they do presently assemble themselves . . . to choose another in his stead, where they do nominate and elect for the most part not the eldest son nor any of the children of the lord deceased, but the next to him of blood that is eldest and worthiest, as commonly the next brother, if he have any, or the next cousin and so forth, as any is elder in that kindred or sept, and then next to him they choose the next of the blood to be tanaist, who shall succeed him in the said captaincy if he live thereunto." This system may be described as the election of an elder to be head of the sept (like the analogous election of a patriarchal "house-father" in a joint family), with an additional choice of an elder in reversion, to avoid disputes as to succession in times of war. A similar rule may have obtained among the Teutonic tribes (Maine, *Early Hist. Inst.*, 202); as the smaller chiefs sank into the position of nobles and were succeeded by their eldest sons (for reasons connected with the priestly character of the king) in the possession of their offices and demesnes, a rule of the same kind might grow up with regard to the king or ruling chieftain, by which the eldest son would get not only his private demesne but also that "portion of land attached to the seignory or chieftain which went without partition to the tanaist." In this way a principle of inheritance might be formed "which first of all extended from the demesne to all the estates of the holder of the seignory, however acquired, and ultimately determined the law of succession for the privileged classes throughout feudalized Europe" (*ibid.*, 204, 208). This part of the subject is confessedly very obscure; and it must not be forgotten that there were other and stranger modes of succession to chieftainships in Ireland and Scotland, which appear to have been unconnected with any such rules of primo-

geniture (Girald. Cambr., *Top. Hibern.*, iii. 25; Ware, *Ant. Hib.*, ii. 64; Ailred's *Chron.*, ed. Twysden, 348; Robertson, *Early Kings*, i. 36). Bede has left us a description of the rule among the Picts. "It was the custom in Pictland," as the saying went, that the kingdom should come from women rather than from men. (Compare the similar customs among the ancient Spartans, Lycians, and Iberians in M'Lenan's *Studies*, 101, 145.) The dignity never went from father to son, but when the king died the crown went to his next brother, or in default to his sister's son, or in any event to the nearest male relation claiming through a female and on the female side. The list of kings contains no instance of a son bearing his father's name, or of the same name belonging to both father and mother; and the only fathers of kings of whom any account has survived are certainly known to have been foreigners, the one being a prince of Strathclyde and the other a grandson of the king of Northumbria. One and the same rule of primogeniture has been applied in England to royal and to private estates, with the exception as to the succession of the eldest daughter which has already been mentioned. The system varied greatly in the Continental countries according to the circumstances of each case. In France the crown was regarded as a partible inheritance under the first two dynasties. At the beginning of the 11th century primogeniture had become the rule as to fiefs, offices, and dignities, and partly no doubt from analogy and partly for reasons of public policy the crown was brought within the same rule under the house of Capet (Montesquieu, *Esprit des Lois*, xxxi. 32; Kenny, *Law of Primogeniture in England*, 10). But in this case there was a singular modification, known as the "Salic Law" or "Salic rule" (as if it had been derived from the customs of the Salian Franks), by which the succession was eventually limited to males claiming through males. The origin of this law has been found in the fact that "the kings sprung from Hugh Capet succeeded one another, son to father, or brother to brother, for more than 300 years" previously to the disputes which arose in the 14th century as to the succession of an heir claiming through a female (Maine, *Early Law and Custom*, 154). The rule was adopted because it corresponded to the facts which had existed; it was extended because it suited the circumstances of those states in which the sovereign had a large authority; in constitutional countries the rule has been considered to be against public policy, partly perhaps because the reign of a female sovereign is regarded as favorable to popular liberties.

The history of primogeniture as applied to feudal succession is simpler than that of the inheritance of the crown. When a fief was regarded not strictly as an estate in land but rather as being in the nature of an office, there was at first no room for the notion of its descent to an heir. Held first at will and afterwards for short fixed periods, the fiefs or benefices came gradually to be regarded as inheritances. When this idea was first established the fief was usually treated as being partible among all the sons, and it was not until 1138 that Frederick Barbarossa, for reasons of public policy, forbade the greater tenancies to be subdivided. The *Assises de Jérusalem* had laid down the same rule in 1099, though the king was then allowed to select any one of the children for succession. "In Brittany, primogeniture was not introduced till 1185, even for nobles and knights. . . . Down to the French Revolution a German baron had to make a family settlement and to get the consent of his younger sons, if he wished his land to descend to the eldest son alone" (Kenny, 11). In France the eldest son began to gain pre-eminence in the division of fiefs about the beginning of the 11th century, and the usage spread with more or less vigor through all the Western countries. "Usu ad omnia feuda serpsit, ut vel ex asse majori cedant, vel major præcipuum aliquod in iis habeat"

(Zoesius, cited in Co. Litt., 191a). In countries where the Roman law prevailed the privileges of the eldest son were secured by a legal fiction, the jurists deciding that every noble was a "miles" or soldier on service entitled to exceptional benefits. In Spain the inheritance was considered to be divisible into fifteen shares, of which seven in all (being one-fifth of the whole and one-third of the residue, known as the customary "fifth and third") were within the parent's disposal as a *majoratas*; and this was usually entailed upon the eldest son. Similar privileges by way of *majorat* have been given to particular landowners in France at various times since the abolition of primogeniture in the great Revolution. The feudal primogeniture of England was firmly established in the reigns of the first two Norman kings, with a temporary provision for the case of estates lying both in England and Normandy, in which the Norman estate was allotted to the eldest son and the English estates to the second. Its origin, as we have seen, is to be found partly in old modes of customary inheritance surviving both in England and in Normandy, but mainly in the deliberate policy of the sovereigns, who wished to keep the military estates together, and took advantage of the strictness of the "custom of Caux" to carry out the objects of the "law of the sword." (C. I. E.)

PRIMROSE.¹ The genus *Primula* contains numerous species distributed throughout the cooler parts of Europe and Asia, and found also on the mountains of Abyssinia and Java. They are all herbaceous perennials, possessing a permanent stock, from which are emitted tufts of leaves and flower-stems which die down in winter; the new growths formed in autumn remain in a bud-like condition ready to develop themselves in spring. They form the typical genus of *Primulaceæ*, the floral conformation of which is very interesting on several accounts independently of the beauty of the flowers. Thus the five stamens springing from the tube of the corolla, instead of being placed alternately with or between its lobes, are opposite or "superposed" to them, an arrangement accounted for by some on the supposition that an outer row of stamens (which, if present, would render the flower symmetrical) is suppressed. In support of this view the case of *Samolus*, an allied genus in which there are five petaloid stamens as well as five fertile ones, may be cited. By others the anomaly is explained on the hypothesis that the corolla is suppressed, what appears to be such being merely an outgrowth from the stamens. But this view is not borne out by observation of the development of the flower. Within the base of the corolla tube is the one-celled superior ovary, rising up into the centre of which is a dome-shaped placenta, quite detached from the walls of the ovary and studded with ovules. The origin and explanation of this free central placenta have formed the subject of a copious literature, the point at issue being whether the placenta is a direct prolongation from the axis of the plant or an outgrowth from the walls of the carpels.² The variation in the length of the stamens and of the style in the flowers of this genus has attracted much attention since Darwin pointed out the true significance of these varied arrangements. Briefly it may be said that some of the flowers have short stamens and a long style, while others have long stamens, or stamens inserted so high up that the anthers protrude beyond the corolla tube, and a short style. Gardeners and florists had for centuries been familiar with these variations, calling the flowers from which the anthers protruded "thrum-eyed" and those in which the stigma ap-

¹ Lat. *primula*; Ital. and Span. *primavera*; Fr. *primevère*, or in some provinces *primerole*. Strangely enough the word was applied, according to Dr. Prior, in the Middle Ages to the daisy (*Bellis perennis*), the present usage being of comparatively recent origin.

² For a full discussion of this and other points in the morphology of the flower, the reader may refer to Dr. Masters's paper in the *Proceedings of the Linnean Society*, 2d ser., vol. i. (1877) p. 285, or to Eichler's *Blüthen-Diagramme*.

peared in the mouth of the tube "pin-eyed." Darwin showed by experiment and research that the most perfect degree of fertility, as shown by the greatest number of seeds and the healthiest seedlings, was attained when the pollen from a short-stamened flower was transferred to the stigma of a short-styled flower, or when the pollen from the long stamens was applied to the long style. As in any given flower the stamens are short (or low down in the flower-tube) and the style long, or conversely, it follows that to ensure a high degree of fertility cross fertilization must occur, and this is effected by the transfer of the pollen from one flower to another by insects. Incomplete fertility arises when the stigma is impregnated by the pollen from the same flower. The size of the pollen-grains and the texture of the stigma are different in the two forms of flower. The discovery of the physiological significance of these variations in structure, which had long been noticed, was made by Darwin, and formed the first of a series of similar observations and experiments recorded from time to time in the *Journal of the Linnean Society* and elsewhere by himself and subsequent observers. Among British species may be mentioned the Common Primrose (*P. vulgaris*); the Cowslip (*P. veris*), which is the original source of the *Polyanthus* of the gardens; the true Oxlip (*P. elatior*), a rare plant only found in the eastern counties; and the Common Oxlip, by some considered to be a form of the Common Primrose, but provided with a stem supporting the flowers. Darwin's experiments go to prove that the first-named three are species, while the last-named is a hybrid between the cowslip and the primrose. In addition to these species two others occur in Britain, namely, *P. farinosa*, found in Wales, the north of England, and southern Scotland, and *P. scotica*, which occurs in Orkney and Caithness. These two species are found also in high Arctic latitudes, and *P. farinosa*, or a very closely allied form, exists in Fuego.

The *Auricula* of the gardens was formerly considered to be a form of *P. Auricula*, a yellow-flowered species, a native of the Swiss mountains, but it has been recently shown by Kerner that in all probability the origin of the *Auricula* was *P. pubescens*, supposed to be a natural hybrid between *P. Auricula* and *P. hirsuta*. The *Polyanthus* has already been mentioned as a variety of the cowslip, but it may further be added that some very remarkable forms which have been cultivated for centuries owe their peculiarities to the assumption by the ordinarily green calyx of a petaloid condition; when this is complete we have the condition called "hose in hose" by the gardeners. This may, however, arise from actual duplication of the corolla within the calyx. The Chinese Primrose, now so much cultivated in gardens, is derived from *P. prenians*. The Japanese Primrose is nearly or quite hardy, and is the stateliest of the genus; its flowers of varied colors are placed tier above tier, like the branches of a fir tree. *P. cortusoides* is another Japanese species of which many forms are now cultivated. *P. sinensis*, with mealy leaves and yellow flowers, is the Abyssinian Primrose of gardens. The Himalayas are rich in species of primrose, often very difficult of determination or limitation, certain forms being peculiar to particular valleys. Of these *P. denticulata*, *Stuartii*, *sikkimensis*, *ivalis*, may be mentioned as frequently cultivated, as well as the lovely rose-colored species *P. rosea*.

PRINCE. "Prince" and "princess" are names or descriptions implying either political authority or social rank in the persons to whom they relate or are accorded. We have in "prince" the English and French form of the Latin *princeps*, which with more or less modification has been adopted into nearly every language of modern Europe, and of which the original and common use was to indicate priority or pre-eminence of any sort. In an honorary sense it was, to begin with, applied by the Romans to the first or most distinguished members of the senate and the equestrian order respectively, and their appellations of *princeps senatus* and *princeps juventutis* were afterwards appropriated to the emperors themselves and to their adopted heirs and successors in the empire. Hence

the attribute *princeps* became definitely associated with the notions of sovereignty and dominion, and its derivatives have been always and everywhere employed as titles of dignity and expressions of awe or respect.

In English the word "prince" may be used in certain connections in the original wide sense of the Latin word. More definitely it is applicable to supreme rulers of both sexes and almost all kinds. Thus the emperor of Russia, the queen of England, and the king of the Belgians are equally princes or monarchs, and the consorts of emperors and kings are princesses. But the presidents of republics are neither princes nor monarchs. Prince, however, unlike monarch, applies to rulers who are subordinate as well as to rulers who are supreme, to such minor potentates as the electors of the old German empire or the feudal peers of France once were, and the reigning grand-dukes or dukes of Germany now are. Again, all the children and many of the descendants and other relations of monarchs and princes of every class and grade are themselves princes or princesses, although it often happens that they have also some special name or personal dignity by which they are ordinarily known. The eldest son of the emperor of Russia, for instance, is called the "cesarevich," as the eldest son and next brother of the king of France under the *ancien régime* were called the "dauphin" and "monsieur." In England for several centuries the young sons of the sovereign have had dukedoms conferred on them, as in the cases of the dukes of Edinburgh, Connaught, and Albany, and from the reign of Edward IV. until the reign of Victoria the dukedom of York was always given to the second son and the dukedom of Gloucester to the third, unless it was already appropriated. The princes and princesses of Russia are "grand-dukes" and "grand-duchesses," of Austria "archdukes" and "archduchesses," and of Spain "infants" and "infantas." Some of the eldest sons of kings are "dukes," as the duke of Brabant in Belgium and the duke of Sparta in Greece. But, when they are not dukes, or princes with a territorial title, as the prince of Wales or the princes of Naples in Italy and Orange in Holland, they are described as "princes" with the additions of "imperial," "crown," "royal," or "hereditary," as the case may be, and the name of the dominions to which they are the heirs-apparent. The eldest sons of reigning grand-dukes or dukes, however, are called "hereditary grand-dukes" or "hereditary dukes," their younger brothers and their sisters being all the same princes and princesses. The Prussian fashion of calling the eldest daughter of the sovereign the "princess royal" was introduced into England by George II. It was not the custom, however, for the daughters of English monarchs to be entitled "princesses" at all until the reign of Charles I. The two daughters of Henry VIII. were the Lady Mary and the Lady Elizabeth until they ascended the throne, for, although there is a tradition that they were both made princess of Wales successively, there is no evidence whatever to support it. As late as the reign of Charles II. the granddaughters of Charles I., daughters of James, duke of York, the heir-presumptive to the crown, were called the Lady Mary and the Lady Anne until they became princesses by marriage, the one as the wife of William, prince of Orange, and the other as the wife of Prince George of Denmark. It is difficult to say when the younger sons of English sovereigns were originally called "princes." But the practice of so calling them probably began as early as the reign of Henry VII., although there was no opportunity of observing it again before the reign of James I., when it was certainly established.

In France before the Revolution the designation of "princes du sang," or "princes of the blood," was common from generation to generation to all the male descendants of the French kings, and they had precedence according to their proximity to the crown of all dignitaries and nobles. It was not, however, until the

reign of Charles VII. or Louis XI. that they were called "princes," their earlier appellation having been "seigneurs du sang" or "seigneurs du lignage du roi." In France, too, the natural children of the king were, when formally acknowledged, termed "princes légitimés," at any rate from the reign of Louis XIV., and although they were excluded from the line of succession to the throne they were ranked immediately after the princes du sang. The princely character of all the male descendants of the imperial, royal, and other reigning families of the Continent, when neither illegitimate nor the issue of a morganatic marriage, is perpetual and indelible. Moreover, the families which were formerly reigning within the boundaries of the old German or existing Austrian empires, despite that they have now ceased to reign, are in this respect still in the full possession of their earlier privileges. But in England, on the contrary, it was considered necessary only about a quarter of a century ago to make express provision by royal authority that the titles of "prince" and "princess" should be enjoyed by the children of the sons as well as by the sons and daughters of any sovereign of the United Kingdom. It may therefore be concluded that they had no previous claim to the attributes of prince and princess, and that they will not transmit them to their posterity.

Besides the more or less general uses of the words "prince" and "princess," which we have already noticed, there are the particular applications of them, first to a distinct class of rulers, and secondly to a particular order of nobility. Princes regarded as the political chiefs of states are inferior to emperors and kings, and not necessarily superior to reigning grand-dukes or dukes. Very few examples of them at present exist,—those of Waldeck and Pyrmont, Montenegro, Bulgaria, and Monaco alone occurring to us.¹ None of the great feudatories of the Middle Ages, whether in Germany, France, or Spain, were formally described as princes, and of the mediatised families still extant who once supplied members to the imperial diet, many of them from a remote period, not one had the designation of "prince" before the commencement of the 17th century, while not more than five or six had it before the commencement of the 18th century. The old Italian and Welsh princes and the more modern princes of Orange are in fact nearly the only reigning princes who are remembered in history. As a name of dignity, neither of dominion on the one hand nor of courtesy on the other, "prince" is common enough among the nobility of the Continent. But in England it is never conferred on anybody except the heir-apparent to the crown, and his principality is a peerage. Since the reign of Edward III. the eldest sons of the kings and queens of England have always been dukes of Cornwall by birth, and, with a few exceptions, princes of Wales by creation. Before that Edward I. had conferred the principality on his eldest son, afterwards Edward II., who was summoned to and sat in parliament as prince of Wales. But Edward the Black Prince was the original grantee of the principality as well as of the dukedom, under the special limitations which have continued in force to the present day. The entail of the former was "to him and his heirs the kings of England" and of the latter "to him and his heirs the first-begotten sons of the kings of England." Hence when a prince of Wales and duke of Cornwall succeeds to the throne the principality in all cases merges at once in the crown, and can have no separate existence again except under a fresh creation, while the dukedom, if he has a son, descends immediately to him, or remains in abeyance until he has a son if one

is not already born. If, however, a prince of Wales and duke of Cornwall should die in the lifetime of the sovereign, leaving a son and heir, both dignities are extinguished, because his son, although he is his heir, is neither a king of England, nor the first-begotten son of a king of England. But if instead of a son he should leave a brother his heir, then—as was decided in the reign of James I. on the death of Henry, prince of Wales, whose heir was his brother Charles, duke of York—the dukedom of Cornwall would pass to him as the first-begotten son of the king of England then alive, the principality of Wales alone becoming merged in the crown. It has thus occasionally happened that the dukes of Cornwall have not been princes of Wales, as Henry VI. and Edward VI., and that the princes of Wales have not been dukes of Cornwall, as Richard II. and George III.² It was in direct imitation of these dignities that the principality of the Asturias and the dukedom of Rothesay were created by John I. of Castile and Robert III. of Scotland in favor of their eldest sons and the eldest sons of their successors. In the new kingdoms of Holland and Italy the principalities of Orange and Naples have been appropriated to the eldest sons of the sovereigns. Under the monarchy in France princes invariably yielded precedence to dukes, unless of course they were "princes du sang" or "princes légitimés," as the princes of Condé, of Conti, or of Lamballe. Several of the French dukes numbered principalities among their inferior titles, as the duke of La Rochefoucauld also prince of Marillac, and the duke of Gramont also prince of Bidache, while several of the French princes were the heads merely of junior branches of ducal families, as the princes of Léon and of Soubise of the Rohan family, and the princes of Tingry and of Robecq of the Montmorency family. When Napoleon established the empire and reintroduced titles into France, princes were made the first and dukes the second order of the new nobility. But only a few princes were created—Talleyrand, prince of Bénévent; Bernadotte, prince of Ponte Corvo; Berthier, prince of Wagram; Davoust, prince of Eckmühl; Masséna, prince of Essling; and Ney, prince of Moskowa, nearly if not quite exhausting the list. In Germany and Austria the title of "prince" is represented by "Prinz" when it appertains to the members of imperial and royal families, as Kronprinz von Oesterreich or Prinz Wilhelm von Preussen, and by "Fürst" when it appertains to the members of mediatised or noble families, as Fürst von Salm-Salm or von Hohenlohe-Langenburg, and Fürst von Metternich-Winneburg or von Bismarck-Schönhausen. According to its identification with "Prinz" or "Fürst" it is a higher or lower dignity than "Herzog" (duke). In the old empire, however, the Churfürsten or electors were always next to the emperor and the king of the Romans. In Italy, as well as in Belgium and Holland, princes are inferior to dukes as members of a particular order of nobility. In Spain and Portugal we are not aware that the title of "prince" has ever been conferred on a subject outside of the royal family except in the well-known case of Godoy, Prince of the Peace. Among the Russian nobility there are neither dukes nor marquesses, the orders being princes, counts, and barons. It is to be observed, however, that in no part of the Continent does precedence depend exclusively as in the United Kingdom on the apparent rank of titular distinctions or the relative positions which they nominally occupy in formal classification.

(F. DR.)

PRINCE EDWARD ISLAND, formerly called Isle St. Jean, a province of Canada, in British North America, lies between 45° 58' and 47° 7' N. lat. and 62° and 64° 27' W. long., on the south side of the Gulf of St. Lawrence. It is separated from Nova Scotia on the south and from New Brunswick on the south and west by Northumberland Strait, which varies from 9 to 30 miles in width. Its greatest length is nearly 150 miles, its

See Plate IV., vol. xvii.

¹ [Bulgaria is an hereditary principality under the sovereignty of the Sublime Porte, as is the island of Samos. Other princely sovereignties are Liechtenstein, Reuss-Greiz, Reuss-Schleiz, Schaumburg-Lippe, Schwartzburg-Rudolstadt, Schwartzburg-Sondershausen, Lippe Detmold. (See Almanack de Gotha, 1885, pp. 97, 98, 1054, 1056).—AM. ED.]

² [Richard II. and George III., not being sons of reigning kings, were excluded from the title "Prince of Wales." Richard, brother of Henry III., and Henry VIII. were dukes of Cornwall, but not princes of Wales.—AM. ED.]

general breadth 34 miles, and the area 2133 square miles (1,365,120 acres).¹

Physical Features.—Prince Edward Island resembles a crescent in its northern outline, the two horns being North and East Capes, and it is altogether irregular in form. Its surface is slightly rolling, the elevations of land, however, rising nowhere higher than 500 feet. The coast-line is indented with numerous bays and projecting headlands, the more prominent of the latter being North Cape on the northwest, West Cape on the west, East Cape on the east, Cape Bear on the southeast; others are Stewart, Bell, Prim, Gallas, Black, Amherst, and Fifteen on the south, Kildare, Aylesbury, Turner, Cablehead, and Campbell on the north, Durell and Bruce on the east, and Seal Point on the west. The principal bays are Richmond on the north, Egmont on the southwest, Hillsborough on the south, and Cardigan on the east. These inlets, piercing the land from opposite directions, form narrow isthmuses which divide the island into three distinct peninsulas. Other bays are St. Peter's, Greenville, Harrington, and Tignish on the north; Colville, Rollo, Fortune, and Boughton on the east; Orwell and Pownall on the south. Along the coasts are several small islands, viz., Grover, Fish, Burnaby, Lennox, Robinson's, Boughton, Panmure, Wood, Governor, St. Peter's, and Brae. The chief rivers are North, Elliott or West, Hillsborough or East, Ellis or Grand, Percival, Trout, Boughton, Murray, Dunk, and Morrell. The Grand river is the seat of a large and increasing oyster and codfish trade. The Dunk is a fine salmon and trout stream. The principal harbors are Charlottetown, Georgetown, Bedeque, Port Hill, Cascumpeque, Souris, Murray, Savage, Bedford, and Westmoreland. The island is well watered, and by the disintegration of the soft red sandstones a bright red loamy soil of great fertility is produced. To this the province owes its remarkable productiveness as an agricultural district, and the gently undulating surface, the rich fields, and pretty homesteads embowered in trees give variety and beauty to the landscape.

Geology.—The oldest geological formations in Prince Edward Island are represented by beds of brown, gray, and red sandstone and shale, with layers of coarse concretionary limestone and fossil plants. These are of newer Carboniferous (or in part of Lower Permian) age, and have been named by Sir William Dawson the Permo-carboniferous series. They appear in the peninsula between Orwell Bay and Pownall Bay, in Governor's Island, in Hillsborough Bay, and on the coast between West and North Capes, as well as in other localities on the south and west. But the prevalent rocks are bright red sandstones with calcareous cement, alternating with beds of red and mottled clay, and with occasional white bands and layers of concretionary limestones and conglomerate, which in mineral character resemble the Trias or New Red Sandstone of Nova Scotia. The formation may be divided into two sections: "the lower, representing," says Dawson, "the Bunter Sandstein of Europe, is characterized by the prevalence of hard concretionary calcareous sandstones and obscure fossil plants, while the upper (representing, perhaps, the Keuper of Europe) has softer and more regularly bedded sandstones and clays." Owing to the similarity of the Permo-carboniferous and Triassic beds, and the general covering of soil, it is not possible definitely to mark the limits of the two formations. Drift deposits, viz., boulder clay, stratified sand and gravel containing in some places sea-shells of species now living and occasional boulders (this deposit comparatively rare), and loose boulders, overlie the surface of the more solid rocks in the greater part of the island. Beds of peat, dunes of drifted sand, alluvial clays, and mussel mud (valuable as a

fertilizer) occur in creeks and bays. The portions of country occupied by the Upper Carboniferous series are generally flat, and this applies, observe Drs. Dawson and Harrington, to a portion of the Triassic region north of Bedeque, where the beds seem to have been subjected to severe aqueous denudation. The minerals are unimportant, neither coal, gypsum, nor gold being found in any part of the island.

Climate and Vegetation.—The climate of Prince Edward Island is much milder than that of the adjacent provinces, and, though the winter is severe and cold, the air is invigorating and salubrious. The coldest month is January, when the thermometer registers a daily average of 15.9°. Fogs seldom occur. In the summer the heat is less extreme than in Quebec, the mean being 62.3°, and the pleasant autumn months attract visitors from all parts of the American continent. Vegetation develops rapidly, and agriculture is extensively prosecuted. Wheat, barley, oats, peas and beans, potatoes, turnips, and other crops ripen to perfection.

The amount of land under crop in 1881 was 467,211 acres, and in pasture 126,935 acres. The chief produce raised in that year was 546,986 bushels of wheat, 119,368 of barley, 3,538,219 of oats, 90,458 of buckwheat, 6,042,191 of potatoes, 1,198,407 of turnips, 42,572 of other roots, 143,791 tons of hay, and 15,247 tons of grass and clover seed. Of live stock there were 31,335 horses, 45,895 milch cows, 44,743 other horned cattle, 166,496 sheep, and 40,181 swine. 1,688,690 lb of butter, 196,273 of cheese, 14,945 of honey, and 25,098 of maple sugar were made during the year. Prince Edward Island does not grow much fruit, but the apple crop is usually good, though not large, and grapes, plums, and currants are grown in small quantities. The land which is not cultivable consists of soft spongy turf which may be used for fuel.

Commerce.—The forests of the island used to be very extensive, but lumbering operations, destructive fires, and the needs of the husbandmen have reduced them, though many trees still remain, the principal being beech, birch, pine, maple, poplar, spruce, fir, hemlock, larch, cedar, etc. The exports in 1883 were valued as follows: Produce of the forest, \$28,385; agricultural produce, \$377,614; animals and their produce, \$238,952; manufactures, \$183,986, the total being \$1,318,549; that of the imports (manufactured goods, iron, hardware, wine, spirits, tobacco, tea, coffee, sugar, molasses, etc.) was \$682,170.

Industries.—Shipbuilding in former years was a very active industry. It is still carried on, but to a considerably smaller extent,—the number of vessels built in 1883 having been only seventeen, with a tonnage of 5343. On the 31st of December, 1883, the vessels registered in the province and remaining on the registry books of the several ports amounted to 241, with a tonnage of 40,400. In that year there were engaged in the coasting trade (including steamers) 1162 vessels, representing a tonnage of 113,117. The manufactures are chiefly for domestic use, and include the making of woollen cloth, saws and files, saddles and harness, sashes, doors, and blinds; there are also saw-mills, starch factories, taneries, tin and sheet-iron works, tobacco-pipe factories, etc. In 1881 the amount of capital invested in industries was \$2,085,776, giving employment to 5767 hands, and the value of the products was \$3,400,208.

Fisheries.—The fisheries are exceedingly valuable, particularly those on the north coast, the catch being chiefly mackerel, haddock, cod, hake, and herrings, though other kinds are taken. Of late years increased impetus has been given to this industry, and many men and boats are employed in conducting it. Enormous quantities of lobsters and oysters are annually shipped to all parts of the American continent as well as elsewhere. The value of the fisheries in 1883 was nearly half a million dollars.

Game, Etc.—Wild ducks, teal, brant, wild geese, woodcock, partridges, pigeons, and snipe occur in great abundance. Birds number 260 species. Of wild animals the principal are bears (found occasionally only), lynxes, foxes, musk-rats, hares, squirrels, etc. In the summer and autumn seals in large numbers frequent the shores.

Communication.—Good wagon roads are to be found wherever there is a settlement. The Prince Edward Island Railway, 200 miles long, runs from one end of the

¹ [Greatest length, 130 miles; breadth, 34 miles,—in its narrowest part near the centre it is only four miles wide. Walker and Miles's *Standard Atlas of the Dominion of Canada*, Montreal, 1875.—AM. ED.]

island to the other, and branches off to every town or point of importance. The main line extends from Souris and Georgetown on the east to Tignish on the northwestern extremity, connecting with Summerside and Charlottetown, the capital. During the season of navigation regular communication is had by steamer with Nova Scotia, New Brunswick, Quebec, and Boston. Navigation usually closes about the middle of December and opens before the first of May. In winter the mails and passengers are conveyed across the strait in ice-boats, which ply between Cape Traverse in Prince Edward Island and Cape Tormentine in New Brunswick. A steamer runs between Georgetown and Pictou, Nova Scotia, nearly the whole season. There is a post-office to every 400 of the inhabitants. Telegraphic communication is maintained with America and Europe by means of a submarine cable about 10 miles in length, connecting the island with New Brunswick. Telegraph offices are established throughout the province and along the line of railway.

Population.—The province is divided into three counties, viz., King's, Queen's, and Prince, which are subdivided into sixty-seven townships and three royalties. The population is of mixed origin, a large proportion being emigrants from Great Britain, and the remainder natives of the country, descendants of the French Acadians, Scottish, English, and Irish settlers, and the loyalists who went to the island after the American revolution. The Indians number 281. In 1881 the population was 108,891 (54,729 males and 54,162 females). The Roman Catholic diocese is situated at Charlottetown, and authority over the spiritual affairs of the Episcopalians is exercised by the bishop of Nova Scotia. The following table shows the chief religious denominations and the number of their adherents:

Church of Rome.....	47,115	Church of England.....	7,192
Presbyterians	33,835	Baptists.....	6,236
Methodists.....	13,485		

The chief towns are Charlottetown (11,485), the capital of the island and the county town of Queen's, Summerside (2853), capital of Prince county, and Georgetown (1118), capital of King's county. Princetown is a flourishing seaport on Richmond Bay, and Rustico, famous for its bathing facilities, is a place of popular summer resort. Tignish and Alberton are stations much frequented by fishermen, and Souris, 60 miles east of Charlottetown, well furnished with harbor accommodation, is the outlet for the exports of the greater part of King's county. Other rising villages are Mount Stewart, Kensington, Montague, Breadalbane, and Crapaud.

Administration, Finance, etc.—The affairs of the province are administered by a lieutenant-governor and an executive council consisting of nine members, three with portfolios and six without, assisted by a legislative council of thirteen members and a legislative assembly of thirty members, both elective. The lieutenant-governor is appointed by the governor-general of Canada in council. A system of responsible government has existed in the island since 1851. Prince Edward Island returns six members to the Canadian House of Commons, and four Senators are appointed to the Canadian Senate by the crown. All males owning a freehold or leasehold property to the value of \$400, or partly freehold and partly leasehold amounting together to \$400, and in possession of the same for at least twelve months previous to election, have the right to vote for a member of the Legislative Council. The franchise for the House of Assembly is practically residential manhood suffrage.

In 1882 the public revenue was \$233,464, and the expenditure \$257,228. The chief source of revenue is the yearly subsidy granted by the Dominion Government under the terms of the British North America Act. In 1883 it amounted to \$164,674. The remainder of the receipts is derived from the sale of Government lands, licenses, and miscellaneous fees. The provincial legislature meets at Charlottetown, where the public offices are situated. The judiciary consists of a supreme court with one chief and two assistant judges; a court of chancery, of which the lieutenant-governor is *ex officio* chancellor, and the judicial powers of which are exercised by a master of the rolls and vice-chancellor; a court of marriage and divorce, of which the lieutenant-governor and members of the executive council are judges; a court of vice-admiralty with one judge and two deputies; a court of probate and wills with one judge; three county courts with one judge for each; and stipendiary magistrates and justices of the peace. The province has authority to make its own civil laws, but in all criminal cases the form employed in the courts is the criminal law of the Dominion. Prince Edward Island is the twelfth military district in the militia of Canada. The established strength of the active force, by arms, is composed of three batteries of garrison artillery, one company of engineers, and ten companies of infantry,—total, 54 officers and 608

non-commissioned officers and men. The period of service in time of peace is three years.

Education.—The free-school system has obtained in the island since 1852. Previous to that date the schools were mainly supported by voluntary subscription and such local assistance as could be obtained. In 1877 the Public Schools Act—an ample and liberal measure—was passed, and a department of education was instituted. Two years later ladies were admitted to Prince of Wales College, an institution established in 1860, and amalgamated in 1879 with the normal school, and since then the department has introduced many improvements into the system. The total number of teachers in 1833 was 473, of school districts 419, and of schools 424. The number of pupils enrolled was 21,495, and the average daily attendance was 11,759. The total expenditure for education was, by the provincial Government \$101,193, by the school districts \$35,624, total \$136,817. The Bible is read in all public schools. Besides the institutions named there are St. Dunstan's College (exceedingly well conducted, and Roman Catholic in religion), a model school, thirteen high schools, and several private schools and academies. The local government maintains a hospital for the care of the insane, and the marine hospital is under the control of the Dominion authorities.

History.—Sebastian Cabot is said to have discovered this island in 1497, but the authority on which this statement rests is at least doubtful. Certain it is that Jacques Cartier had the credit of naming it Isle St. Jean when he discovered it on 24th June, 1534, during one of his voyages up the St. Lawrence. That name clung to it for 265 years. Champlain, early in the next century, took possession of it for France, and in 1663 a grant was made of it to Captain Doublet, an officer in the army, who, however, failing to make settlements in the colony, soon afterwards lost his grant. Little attention was paid to the island until after the peace of Utrecht, when the French, allured by its fertility, made efforts to colonize it. In 1719 it was granted, *en seigneurie*, to the count of St. Pierre, who tried to establish fisheries and a trading company. He lavished considerable means on his enterprise, but the scheme proved unsuccessful and his grant was revoked. In 1755 the island was captured by the British, but after the treaty of Aix-la-Chapelle it was restored to France, from which it was again wrested in 1758. It was afterwards placed under the administration of Nova Scotia, and some years later it was erected into a separate government. The first parliament was called together in 1773, and a constitution was given to the colony. In November, 1798, the legislature passed an Act changing the name of the province to Prince Edward Island, out of compliment to the duke of Kent, who was at that time commander of the forces in British North America. In February, 1799, the Act was confirmed by the king in council.

After the peace of 1763 a plan was agreed to by which the island was divided into townships of about 20,000 acres each. Grants of these lands were made to individuals supposed to have claims on the Government. They were to pay a small sum as quit rents, and the conditions imposed provided for the establishment of churches and wharves, and *bona fide* settlement. The grantees, however, were in most cases mere speculators, who had no mind to brave the trials of colonization in a new country. Many promptly disposed of their "lots," and the lands fell into the hands of a large number of non-residents. The land question remained a vexed point of contention until 1860, when the Government was compelled to appoint a commission to appraise the rights of the absentee owners, and to formulate a scheme of adjustment. The commission advised the Government to buy the lands and resell them to the tenantry. A Bill for that purpose was passed, but the imperial authorities disallowed it. A second attempt proved more successful, and a measure having the same object in view was agreed to. The agitation was silenced, and the tenants eagerly availed themselves of their privileges. At the close of 1882, out of the 843,981 acres of land acquired by the Government, only 142,011 acres remained to be disposed of. Of that amount about 75,000 acres represented land held by parties who had not yet purchased.

Prince Edward Island declined to accept the Act of Confederation in 1867 but in July, 1873, it entered the union of American colonies which constitute the Dominion of CANADA (*q.v.*) (G. ST.)

PRINCE OF WALES ISLAND.¹ the official name of the island popularly known as PENANG or PULO-PENANG (*i.e.*, Areca Nut Island), which lies 8 or 9

¹ Prince of Wales Island is also the name of an island separated by Endeavor Strait from York Peninsula in Queensland, Australia, discovered by Captain Cook in 1770, and since famous for its pearl fishery.

miles off the west coast of the Malay peninsula in 5° 20' N. lat. and 100° 20' E. long. The island is about 15 miles long by 5 broad and has an area of 107 square miles or 69,000 acres,¹ considerably less than the Isle of Wight. When in 1785 it was ceded to the English by the rajah of Kedah in return for an annual pension of 10,000 dollars, it was almost uninhabited; at the census of 1881 its population amounted to 90,951 (comprising 612 Europeans, 21,772 Malays, 45,135 Chinese, 15,730 natives of India), and it has since been increased mainly by further Chinese and Indian immigration. The people from the east coast of India are locally known as Klings, a Malay corruption of Telinga or Telugu; and the half-breed race between Indian and Malay is distinguished as Jawi-Pekan. About two-fifths of Penang are lowland and the rest consists of hills, which towards the north reach their culminating point, 2922 feet above the sea, in the peak now utilized as a sanatorium. A considerable portion of the surface is still uncleared, and from the summit of the peak the whole island presents very much the appearance of a forest, the villages always lying in the midst of groves of the cocoa-nut palm. On the whole, however, vegetation is not so rich as on the neighboring mainland. Apart from the cocoa-nuts and areca-nuts, the principal products are sugar, coffee, and pepper; but increasing attention is again being given to nutmegs and cloves, which can be grown on the hillsides. Of the landholders 2280 were Chinese and 1482 Malays in 1882. In the lowlands the temperature ranges from 80° to 90°, but on the peak from 60° to 75°. The rainfall in 1882 was 126.50 inches—somewhat above the average. Georgetown or Penang, the only town on the island, lies on the east coast on a low plain stretching out into the sea; its harbor, always well filled with both European vessels and native craft, is the strait between island and mainland. Waterworks were undertaken in 1865. Among the public buildings are the town-hall (1872-80), the post-office, (1881), the free school with upwards of 600 pupils, the Christian Brothers' school, several Tamil schools, the general hospital (1882), and the pauper hospital. An important leper hospital is maintained on Pulo-Jarajah, a small but lofty island in the strait opposite the town. Though Singapore has withdrawn much of the trade that formerly found its way to Penang, there has been a great increase both in exports and imports, the aggregate value for 1859-60 being £3,530,000 [\$17,155,800], and for 1882 £8,855,919 [\$43,039,766.34].

The attention of the East India Company was first called to Pulo-Penang by Captain Light in 1771, and it was under his personal command that the settlement was founded in July, 1786. At his death in 1794 he left "a compact little township with fort and public buildings." In 1798 Sir George Leith (for the purpose mainly of rooting out piracy) purchased from the rajah of Kedah for 2000 dollars the tract of land opposite Prince of Wales Island, which has since become known as Province Wellesley (area in 1885, 234 square miles). In 1806 the island was made a presidency of equal rank with Madras or Bombay; and after Singapore and Malacca were incorporated with it in 1826 it remained the seat of the general government till 1832. The commercial part of the town was destroyed by fire in 1808.

PRINCE OF WALES LAND, a large insular tract in the northern Arctic region opposite Boothia Felix, from which it is separated by Franklin Strait.

PRINCES ISLANDS, the Demonesi or Demonesi of the ancients, a beautiful cluster in the Sea of Marmora opposite that part of the Asiatic coast which trends southeast from Scutari to the entrance of the Gulf of Ismid (Nicomedia). They are nine in number—Prote (Turkish, Tinaki), Antigone, Khalki or Karki (Chalcitis or "copper-mine island" of the ancients), Plate, Oxeia, Pitys, Antirobido (Terebinth or Rabbit Island), Neandro, and Prinkipo. Prinkipo or Prinipo (with an Italian c), Kyzyl-Ada or Red Island

of the Turks, the largest of the group, is a broad green hill of red quartz rising with soft and verdant outlines into two peaks, the higher of which (500 feet) is crowned by the ex-monastery of St. George, embosomed amid its oaks. On the height above the town of Prinkipo is the monastery of the Transfiguration and on the coast opposite Antirobido that of St. Nicholas. A white-flowered heath (*Erica arborea*), two species of cistus (*Cistus villosus* and *salvifolius*), and lavender give character to the luxuriant vegetation. Khalki contains three convents and an Ottoman naval college; and the whole group, especially Khalki and Plate, form a great summer resort for the Greeks of Constantinople, from which city there is a regular steamer service.

The Princes Islands are intimately associated with Byzantine history. A convent in Prinkipo (now a mass of ruins at the spot called Kamares) was a place of exile for the empresses Irene, Euphrosyne, Zoe, and Anna Dalassena. Antigone was the prison of the patriarch Methodius, and its chapel is said to have been built by Theodora. In Khalki the monastery of the Theotokos (originally of St. John), which since 1831 has been a Greek commercial school, was probably founded by John VIII. Paleologus, and was rebuilt about 1680 by the famous Panagiotaki, and again by Alexander Ypsilanti of Moldavia. Close beside it is the tomb of Edward Barton, second English ambassador to the Porte. Hagia Trias (a school of theology since 1844) was rebuilt by the patriarch Metrophanes of bibliographical memory. Antirobido is associated with the exile of Ignatius and Theodosius; and Plate contained subterranean state prisons hewn out of the rock.

See Gustave Schlumberger, *Les Îles des Princes*, Paris, 1884; Grisebach, *Rumelien und Brussa*, 1839.

PRINCETON, a borough and township of the United States, in Mercer county, New Jersey, on the Delaware and Raritan Canal, 3 miles north by rail from Princeton Junction, which is 48 miles southwest of New York and 42 northeast of Philadelphia on the Pennsylvania Railway. Standing on high ground, it commands a fine prospect towards the east and south. The town is the seat of Princeton or New Jersey College, founded in 1746 by members of the presbytery of New York, chartered in the same year, and opened at Elizabethtown (now Elizabeth) in 1747, removed to Newark in the same year and rechartered in 1748, and finally transferred in 1756 to Princeton, where Nassau Hall, so called in honor of William III. of England, had been erected. Nassau Hall has been twice burned down, in 1802 and 1855, but was restored in 1856 in the old style. This building, Reunion Hall (1870), West College (1836), East College (1833), and the halls of the American Whig and Clio-sophic literary societies enclose a quadrangle; and eastward, in the line of Nassau Hall or the north front, stand the library buildings (1873), consisting of an octagonal centre with two wings, the Dickinson Hall (1870), and the John C. Green School of Science (1873). Along the western border of the grounds are University Hall (1876), the Halstead observatory (1867), the gymnasium (1869), Witherspoon Hall (1876), and Edwards Hall (1879), while on the east are the Marquand Chapel (1881), Murray Hall (1877), and the residence of the president. Almost all these buildings are the gifts of generous benefactors, the most munificent of whom was Mr. John C. Green, by whom and by the trustees of his estate not less than \$1,500,000 has been given in buildings and endowments. In 1884 the college, which is steadily growing, had 39 professors and 519 students, and the library contained 77,000 volumes. The endowments amount to \$1,392,000. The governor of the State of New Jersey is *ex officio* president of the board of trustees, who are twenty-five in number besides the president of the college. The trustees appoint the members of the faculty and have entire control over the funds and property of the college. They fill all vacancies in their own body. Besides the Halstead observatory, there is another well-equipped observatory at the School of Science, and the laboratories and museum are well furnished for scientific study. In

¹ [The island is nine miles wide. See Whittaker's *Almanack* for 1885, p. 291.—AM. ED.].

the cemetery, which lies to the north of the college, are the tombs of Jonathan Edwards, Aaron Burr, etc. Princeton is also the seat of the oldest theological seminary of the Presbyterian Church in the United States (founded in 1812), with 7 professors, 1 instructor, about 150 students, and an endowment of about a million dollars. The population of the township in 1870 was 3986 and of the borough 2798, and in 1880 respectively 4348 and 3209.

At Princeton on 3d January, 1777, Washington defeated the British forces; the Continental Congress met in the town (Nassau Hall) from 26th June to 4th November, 1783.

PRINGLE, SIR JOHN (1707–1782), a distinguished physician, was the younger son of Sir John Pringle of Stitchel, Roxburghshire, and was born on the 10th of April, 1707. He was educated at home under a private tutor, and subsequently at St. Andrews, at Edinburgh, and at Leyden, where he took the degree of doctor of physic. At the last-named university he was an intimate friend of Van Swieten and Haller. He at first settled in Edinburgh as a physician, but was soon after appointed assistant and successor to the professor of moral philosophy in the university. In 1742 he became physician to the earl of Stair, then commanding the British army in Flanders, and in 1745 was appointed by the duke of Cumberland physician-general to the forces in the Low Countries. In 1749, having settled in London, he was made physician in ordinary to the duke of Cumberland; and he afterwards received other court appointments as physician, and in 1766 a baronetcy. He read a series of papers to the Royal Society, which are to be found in the *Transactions*, and which gained for him the Copley gold medal. His first book was *Observations on the Nature and Cure of Hospital and Jayl-Fevers* (London, 1750). He married in 1752 a daughter of Dr. Oliver, a physician in Bath; and in the same year he published his important work, *Observations on the Diseases of the Army in Camp and Garrison*, which went through many editions and was also translated into French, German, Italian and Spanish. After having acted for many years as a member of the council of the Royal Society, he was in November, 1772, elected president of that body. In this capacity he delivered and published, in connection with the annual assignments of the Copley medal, six "discourses," which were afterwards collected into a single volume (1783). In 1776 he published *A Discourse on Improvements in preserving the Health of Mariners*. After passing his seventieth year he resigned his presidency and removed to Edinburgh in 1780, but returned to London in September, 1781, and died in January following. There is a monument to him in Westminster Abbey, executed by Nollekens.

A *Life of Pringle* by Kippis is prefixed to the volume containing the *Six Discourses*. The library of the College of Physicians of Edinburgh possesses ten folio volumes of his unedited MSS., including an essay "on air, climate, diet, and exercise." There are *Éloges* on Pringle by Vicaire d'Azyr and Condorcet.

PRINTING, TYPOGRAPHIC. See **TYPOGRAPHY**.

PRIOR, MATTHEW (1664–1721), the most distinguished of English society poets, was the nephew, as Chaucer was the son, of a London vintner, and the lives of the two poets were parallel in a good many other respects. Their art earned for both of them social advancement and political employment; both had a turn for business and diplomacy; both were employed on embassies, both even in secret missions; both were officers of the royal household, and both were rewarded with posts in Government offices of trade; and there was besides not a little in common between them as poets. There are not two careers in literature that offer more numerous or more curious points of parallelism. The vintner's nephew in the reign of Charles II. (born July 21, 1664, either, it would appear, at Wimborne in Dorsetshire, or in or near London) attracted the notice of a noble patron while still at

school at Westminster, under the famous Dr. Busby. The earl of Dorset was with a party at the tavern, and the school-boy was called in to decide some debate that had arisen about a passage in Horace. According to the story, Prior acquitted himself so well that the earl, the Mæcenas of his generation, at once undertook to send him to Cambridge, and he was entered at St. John's in 1682. As it happened a fellow school-boy at Westminster was Charles Montague, who afterwards became earl of Halifax. The two continued comrades at Cambridge, and together wrote in 1687 the *City Mouse and Country Mouse*, in ridicule of Dryden's *Hind and Panther*. It was an age when satirists were in request, and sure of patronage and promotion. The joint production made the fortune of both authors. Montague, who was an earl's grandson, was promoted at once, and Prior had to languish only three years as a fellow of his college when he was gazetted secretary to the embassy at The Hague. After four years of this employment he was recalled to England and appointed one of the gentlemen of the king's bedchamber. Apparently also he acted as one of the king's secretaries, and in 1697 he was secretary to the plenipotentiaries who concluded the peace of Ryswick. Prior's talent for affairs was doubted by Pope, who had no special means of judging, but it is not likely that King William would have employed in this important business a man who had not given proof of diplomatic skill and grasp of details. The poet's knowledge of French is specially mentioned among his qualifications, and this was recognized by his being sent in the same year to Paris in attendance on the English ambassador. At this period Prior could say with good reason that "he had business enough upon his hands and was only a poet by accident." To poetry, however, which had laid the foundation of his fortunes, he still occasionally trusted as a means of maintaining his position, and composed odes on various public events that required celebration. His wit made him a favorite as a member of the English legation at Paris, although he used it sometimes in a patriotic manner at the expense of the French. After his return from France, and a brief tenure of other offices, Prior succeeded Locke as a commissioner of trade. In 1701 he sat in parliament for East Grinstead. About the same time for some undiscovered reason he changed his side in politics, and allied himself with Harley and St. John. Perhaps in consequence of this for nine years there is no mention of his name in connection with any public transaction. But when the Tories came into power in 1710 Prior's diplomatic abilities were again called into action, and till the death of Anne he held a prominent place in all negotiations with the French court, sometimes as secret agent, sometimes in an equivocal position, as ambassador's companion, sometimes as fully accredited but very unpunctually paid ambassador. From this greatness the poet had a sudden fall when the queen died and the Whigs regained power. He was considered of sufficient consequence not to be allowed to escape into obscurity. He was specially examined by a committee of the privy council, and kept in close custody for three years. During this imprisonment, maintaining his cheerful philosophy, he wrote his longest humorous poem, *Alma, or the Progress of the Mind*. This, along with his most ambitious work *Solomon*, and a collection of *Poems on several Occasions*, was published by subscription in 1718. The poet did not long survive his enforced retirement from public life, although he bore his ups and downs with rare equanimity. He died at Wimpole, Cambridgeshire, a seat of the earl of Oxford, September 18th, 1721, and was buried in Westminster Abbey, where his monument may be seen in Poet's Corner. Prior had very much the same easy pleasure-loving disposition as Chaucer, combined with a similar capacity for solid work. Johnston lays stress with justice on the variety and the uniform excellence of Prior's

poetry. This distinction may fairly be claimed for a poet who has received the enthusiastic praise, in different views of his work, of two men so different as John Wesley and Mr. Swinburne. Prior tried many kinds of grave and gay, and in the face of such testimony it would seem as if we ought to reconsider Johnson's verdict that he never rises high above mediocrity in any kind. Johnson might have been more lenient to Prior's love-verses if he had not made so much use in them of classical fictions. This was the one thing that the great critic would on no account tolerate; frigid allusions to Venus, Cupid, Diana, Ganymede, and such like "easy fictions and vulgar topics," put him out of temper at once, and excluded the unlucky composition from all chance of fair consideration at his hands. The truth was that what Johnson desiderated in love-verses was honest fervent passion. He had no taste for such elegant trifling as the poems in playful praise of Cloe. Even the pretty compliments in the love-letter to the lady of quality aged five would not have moved him to any ecstasy of admiration. "Whatever Prior obtains above a mediocrity," he says, "seems the effort of struggle and of toil. He has many vigorous but few happy lines; he has everything by purchase, and nothing by gift. . . . His expression has every mark of laborious study; the line seldom seems to have been formed at once; the words did not come till they were called, and were then put by constraint into their places, where they do their duty but do it sullenly." This criticism is too unqualified. It applies very happily to many of Prior's verses, but not to Prior at his best; and even when he is at his worst, it strikes us that the failure is rather owing to his not having labored long enough to conceal the labor. If Prior has nothing by gift, it is equally true—and Johnson admits this also—that he has nothing by theft. He is eminently original, and this will probably help to keep his reputation alive with students of poetry for a very long time. There is a fresh intellectual force and a pregnancy of thought in his writing that has made Prior exceedingly serviceable reading for subsequent poets, and there are some of his short poems in which every stanza has been the cause of happy thought and perfect expression in his successors. "Prior is a lady's book," Johnson once said to Boswell. He might have said with more propriety that Prior is a poet's book—a very good book, not exactly to steal from, but to get stimulus from. (W. M.)

PRISCIAN (PRISCIANUS CÆSARIENSIS), the most celebrated Latin grammarian, lived about 500 A. D., i. e., somewhat before Justinian. This is shown by the facts that he addressed to Anastasius, emperor of the East (491-518), a laudatory poem, and that the MSS. of his *Institutiones Grammaticæ* contain a subscription to the effect that the work was copied (526, 527) by Flav. Theodorus, a clerk in the imperial secretariat ("memoralis sacri scrinii epistoliarum"). Three minor treatises are dedicated to Symmachus (the father-in-law of Boetius). Cassiodorus, writing in the ninety-third year of his age (560? 573?), heads some extracts from Priscian with the statement that he taught at Constantinople in his (Cassiodorus's) time (Keil, *Gr. Lat.*, vii p. 207). His title *Cæsariensis* points, according to Niebuhr and others, to Cæsarea in Mauretania. Priscian's teacher was Theodistius, "noster præceptor, omnis eloquentiæ decus, cui quicquid in me sit doctrinæ post deum imputo" (*Inst. Gr.*, vi. 51), who also wrote an *Institutio artis grammaticæ* (*ibid.*, xviii. 56). A later grammarian, Eutyches, pays Priscian himself a still higher compliment: "de quibus Romanæ lumen faciundæ, meus, immo communis omnium hominum, præceptor, summa cum subtilitate copiosissime grammaticus Priscianus disseuise cognoscitur" (Eutychn., i. 8; Keil, *Gr. Lat.*, v. p. 456). Priscian was quoted by several writers in Britain of the 8th century—Aldhelm, Bede, Alcuin—and was abridged or largely used in the next century

by Hrabanus Maurus of Fulda and Servatus Lupus of Ferrara. Of the general use made of his great work the best proof is that, as Hertz says, there is hardly a library in Europe that did not and does not contain a copy, and that there are now about a thousand MSS. of it. The greater part of these contain only books i-xvi. (sometimes called *Priscianus maior*); a few contain (with the three books *Ad Symmachum*) books xvii., xviii. (*Priscianus minor*); and a few contain both parts. The earliest MSS. are of the 9th century, though a few fragments are somewhat earlier. All are ultimately derived from the copy made by Theodorus. The first printed edition was in 1470 at Venice. It may fairly be said that from the beginning of the 6th century until recently Priscian has reigned over Latin grammar with almost as generally recognized an authority as Justinian has over Roman law. Some account of so remarkable a treatise may reasonably be required.

The *Institutiones Grammaticæ* is a systematic exposition of Latin grammar, dedicated to Julian, consul and patrician, whom some have identified with the author of a well-known epitome of Justinian's *Novellæ*, but the lawyer appears to be somewhat later than Priscian. In length the treatise is about twice the size of Quintilian's *Institutio Oratoria*, and about equal to Madvig's *Latin Grammar*. It is divided into eighteen books, of which the first sixteen deal mainly with sounds, word-formation, and inflections, the last two, which form from a fourth to a third of the whole work, deal with syntax. Priscian informs us in his preface that he has translated into Latin such precepts of the Greeks Herodian and Apollonius as seemed suitable, and added to them from Latin grammarians. Of the latter he occasionally refers to Caper, Donatus, Probus, and Servius; and more rarely to Charisius, Diomedes, Asper, Nonius, Remmius Palæmon, and others. He proceeds in orderly and almost exhaustive fashion, though with some digressions and repetitions, gives definitions, rules, examples, and exceptions, and constantly quotes passages from various writers to illustrate the use of a form. He has thus preserved to us numerous fragments which would otherwise have been lost, e.g., from Ennius, Pacuvius, Attius, Lucilius, Cato, and Varro. But the authors whom he quotes most frequently are Virgil, and, next to him, Terence, Cicero, Plautus; then Lucan, Horace, Juvenal, Sallust, Statius, Ovid, Livy, and Persius. His industry in collecting forms and examples is both great and methodical. His style is somewhat heavy, but sensible and clear; it has not the admirable grace of Quintilian, nor the adroit use of a technical language such as is found in the Roman jurists; but there is no attempt at fine writing, and it is free not of course from usages of late Latin, but from anything that can be called barbarism. Considering the time at which it was written, it is very creditable to the author, and not unworthy of the high place it obtained in the grammatical world. Its defects are such as were till lately common more or less to all grammars.

These defects may be referred in the main to four heads. (1) Priscian avowedly treats Greek writers on (Greek) grammar as his supreme authorities (cf. i. 13; vi. 1; xii. 13, etc.), and, though noticing differences between the two languages, bears too little in mind that each has a history of its own and is a law to itself. (2) There had been no scientific study of phonetics, and consequently the changes and combinations of languages are treated in a mechanical way: e.g., *i* passes into *a*, as *genus, generis, generatum*; into *o* as *saxi, saxosus* (i. 33); *q* passes into *s*, as *torqueo, torsti* (i. 48), etc. (3) The resolution of a word into root or stem and inflectional or derivative affixes was an idea wholly unknown, and the rules of formation are often based on unimportant phenomena, and yet are invested with an authority which is irrational and misleading: e.g., *Venus*, like other names ending

in *us*, ought to have genitive *Veni*, but, as this might be taken for a verb, it has *Veneris* (vi. 86; viii. 5). *Ador* has no genitive because two rules conflict; for neuter in *or* have a short penult (e.g., *æquor*, *æquoris*), and *adoro*, from which it is derived, has a long penult (vi. 49; viii. 6). (4) The practical meaning of the inflections is not realized, and syntactical usages are treated as if they were arbitrary or accidental associations. Thus, after laying down as a general rule for declinable words that, when they refer to one and the same person, they must have the same case, gender, and number, Priscian adds, that when there are transitive words we may use different numbers, as *docceo discipulos*, *docemus discipulum* (xvii. 153-155). He often states a rule too broadly or narrowly, and then, as it were, gropes after restrictions and extensions.

His etymologies are of course sometimes very wild: e.g., *cælebs*, from *cælestium vitam ducens*, *b* being put for *u* because a consonant cannot be put before another consonant (i. 23); *deterior* from the verb *detero*, *deteris*; *potior* (adj.) from *potior*, *potiris* (iii. 3); *arbor* from *robur* (vi. 48); *verbum* from *verberatus aeris* (viii. 1), etc. Nor is he always right in Greek usages: thus, in illustrating Latin moods by Greek he frequently uses the future optative with *άν*, e.g., *ἐκδίδουσι άν*, *πιστεύουσι άν* (xviii. 106), and still more strangely treats *άρα* as identical in force with *άν*, e.g., *quasi tolleretur ac constitueretur*, *ἐπαίρειτο άν και κατατάττειτο άρα*, and misuses both particles, e.g., *in me causam conferebat quod eum codicem obsignassem*, *ἐσφράγισα άν άτοι ἐσφραγικός ειην άρα* (xviii. 110). He evidently regarded *άν* or *άρα* as normally required with the Greek optative or other moods corresponding to the Latin subjunctive (xviii. 117, etc.).

A rapid notice of the order and of some salient points will show both merits and defects in the treatment of his subject-matter. The references are to the book and to Krehl's paragraphs.

Book i. treats of vocal sound and of letters, their changes and combinations. *Elementa* are vowels, semi-vowels, or mutes. Vowels are named from their own sound; semi-vowels sound a vowel before them; mutes sound a vowel after them (i. 7). As semi-vowels he classes *f*, *l*, *m*, *n*, *r*, *s*, *z*, and in Greek names *z*. *F* was, among the earliest Latins, the Æolic digamma, but afterwards was equivalent to *φ*. It is, however, rather a mute, because it is not found at the end of a word, and can be placed before *l* and *r* in the same syllable (ib. 13). *K* is quite superfluous; *g* merely shows that a *u* following has no metrical effect; *h* is a mere aspiration; *i* and *u* sometimes pass into consonants, and then have a different metrical effect from what they have as vowels (ib. 14-17). *D* has often the sound of *z*: e.g., in *meridies*, *hodie* (ib. 31).

Book ii. treats of the syllable and of the letters used to end it, then of the parts of speech. A syllable is an ordered combination of letters uttered with one accent and one breath (ii. 1). A word (*dictio*) is the unit of orderly speech (ib. 14). Speech (*oratio*) is a suitable arrangement of words expressing a complete meaning (ib. 15). The parts of speech are, according to Priscian, eight, viz., noun, verb, participle, pronoun, preposition, adverb, interjection, conjunction. Infinites (i.e., infinitive moods) are included under the verbs, because they have tenses and no cases. Participles are not included, because they have cases and genders but no moods (ib. 18). Priscian obtains a framework for the arrangement of his facts from the "accidents" of each part of speech, and subordinate classifications are taken from the endings of the words. Nouns have the following accidents: *species*, *genus*, *numerus*, *figura*, *casus*. As regards *species* ("class") nouns are proper or appellative, and each of these classes are subdivided into many others. Adjectives are (rightly) treated by Priscian in common with other nouns (ii. 22 sq.). The rest of this book and books iii. and iv. treat of the formation of the different classes of nouns, e.g., of patronymics, possessives, comparatives, superlatives, diminutives, and other derivatives. Book v. treats of gender, number, figure, and case. For gender, nouns are discussed by their endings. Figure is either simple or composite or decomposite (i.e., derivative from composite), as, *magnus*, *magnanimus*, *magnanimitas* (v. 61). There are four modes of composition: (1) *ex duobus integris*, as *tribunusplebis*; (2) *ex duobus corruptis*, as *benivolus*; (3) *ex integro et corrupto*, e.g., *inimicus*; (4) *ex corrupto et integro*, as

impus (v. 58). There are six cases, thus arranged: (1) the nominative as the original; (2) the genitive, because it is born from the nominative, and begets the other oblique cases; (3) the dative, "qui magis amicis convenit;" (4) the accusative, "qui magis ad inimicos attinet;" (5) the vocative as the most imperfect; (6) the ablative as new and peculiar to the Latins (v. 74). In book vi. the formation of the genitive is discussed, each nominative termination being taken in order, irrespective of the declension. Book vii. treats of the other cases in each of the five declensions. Neither here nor in the books on the verb are full paradigms set out as in modern grammars. *Hic*, *hujus*, etc., are often prefixed as symbols of gender and case.

Books viii.-x. deal with the verb. Verbs have eight accidents—*genus*, *tempus*, *modus*, *species*, *figura*, *conjugatio*, *persona*, *numerus*. Some verbs (as other parts of speech) are defective, either by natural necessity or by chance. Necessity may lie in the meaning (e.g., *puerperis* is not found) or in the incompatibility of sound (e.g., *cursor* but not *cursorix*). Chance may lie simply in non-use, e.g., *faux*, *prez*, *dicio*, *for*, *dor*; or because the form would be unpleasant, e.g., *metulurus*, or *metulitrus*, *nutritrix* (from *nutritor*), for which *nutrix* is used. Sometimes a word is not used in order to avoid confusion, e.g., *conjunx* has *conjugis*, lest *conjungis* should be taken for a verb; *maneo* has *mansi*, not *manui*; *fac*, *duc* avoid confusion with ablatives *face*, *duce*, etc. (viii. 4-6).

Genus or *significatio* *verbi* is its being active or passive. Verbs in *o* are active, neuter, and neutro-passive, e.g., *amo*, *spiro*, *gaudeo* (cf. xi. 28). Verbs in *or* are passive, common, and deponent, e.g., *amor*, *osculor te* and *a te, sequor*. Verbs whose meaning and use do not correspond with the form are enumerated (ib. 7-39). *Tempus* is present, past, and future. Past time is divided into past imperfect, past perfect, past pluperfect. Present and future time are not divided by the Romans (ib. 38). *Dixero* is called the subjunctive future (ib. 55, 57). The indicative and subjunctive have all tenses; the imperative has present, future, and, in passive, a past (e.g., *amatus sit*). The optative and infinite have one form expressing both present and past imperfect, and another expressing perfect and pluperfect (ib. 38-43). The present tense embraces to some extent both past and future (e.g., *Priscianus vocor*, *scribo verum*). The perfect corresponds to Greek aorist as well as to perfect (ib. 51-54). Priscian makes five moods—the optative (same in forms as the subjunctive) always requiring an adverb of wishing; the subjunctive, requiring not only an adverb or conjunction, but also another verb, e.g., *cum faciam venito*. In expressions of command, as *ne dicas*, another verb is not required (ib. 68). Supines and gerunds (sometimes confused, sometimes distinguished, by Priscian) are nouns used in place of the infinite. *Amandus*, etc., is called *participiale* or *nomen verbale* (ib. 44, 70). Impersonal verbs have a peculiar meaning (ib. 69).

In class verbs are primitive or derivative. Derivatives are numerous classified as inchoatives, frequentatives, etc. (ib. 72 sq.). In figure verbs are simple or compound (ib. 81). Conjugations in Latin are determined by the vowel of the 2d person, and are thus four only, while the Greeks have ten. Person and number close the eighth book. *Fero*, *volo*, *edo* are specially treated (ix. 4-11). The formation of the perfect is first treated generally (ix. 13), and then the perfects and supines of 1st and 2d conjugations and (in book x.) of 3d and 4th conjugations.

Book xi. deals with participles, which were invented to act as verbs applied to nouns, especially in oblique cases. Hence we can say not only *bonus homo loquebatur* but *boni hominis loquentis orationem audivi*, etc. (xi. 3). The participle has six accidents—*genus*, *casus*, *significatio*, *tempus*, *numerus*, *figura* (ib. 13)—where *genus* is gender, and *significatio* and *figura* have same application as in verbs. The formation of the participles, especially of the past participle, is fully discussed.

Books xii. and xiii. deal with pronouns. They have six accidents—*species*, *persona*, *genus*, *numerus*, *figura*, *casus*. There are four declensions, viz., personal, *ille*, etc., *meus*, etc., *nostras*, etc. Priscian classes as nouns, and not as pronouns, *quis*, *qualis*, *talis*, *quantus*, *tantus*, *tot*, *unus*, *solus*, *totus*, *alius*, *nullus*, *uter*, *alter*, and their compounds (xiii. 11, 29-35).

Having finished the four declinable parts of speech, Priscian turns to the four indeclinable. Prepositions (book xiv.) are (except sometimes in verse) put before nouns both by apposition and composition; before pronouns only by apposition; before all else by composition (xiv. 8). He treats first of prepositions used with the accusative case, then of those used with the ablative, and lastly of those occurring only in composition. Adverbs (book xv.) have *species*, *significatio*, *figura*, where *species* refers to their being primitive or derivative, and *significatio* to their meaning as temporal, local, confirmative, optative, etc. Some are used with all tenses and moods, others with some only. They

are arranged for discussion under their endings (*ib.* 7). Under the endings in *ā* are treated also ablatives of nouns used as adverbs, e.g., *uīa, qua, Roma*, and also other local uses of nouns, e.g., *Romæ sum, Roman eo*, etc. (*ib.* 9). Interjections are separated from adverbs by Roman writers, because they express fully an emotion of the mind, e.g., *pape, quid video*, where *pape*=*mirror* (*ib.* 40). Conjunctions have *figura* and *species*, *species* denoting meaning and use as copulative, causal, disjunctive, etc. Some conjunctions belong to several of these classes.

The two books on syntax are looser in arrangement, and are not so clear and exhaustive as the former books. The truth is, Priscian lacked a good framework for the facts of construction, and first tries one and then another. The seventeenth book rests mainly on Apollonius; the eighteenth is less dependent on him, and ends with a long miscellaneous list, in alphabetical order, of Greek idioms, chiefly verbal, which he compares with corresponding Latin usages. Part of this list occurs twice over. Omitting duplicates, there are nearly 300 such comparisons. Hertz suggests (*Pref. iii. p. vii.*) that it was only closed by the fortunate occurrence of *χαράσσαι*, illustrated by a line of Terence which ended with *satur!* These idioms are illustrated by copious quotations from Demosthenes and Plato, and not a few from Homer, Herodotus, Thucydides, and Xenophon, besides Latin authors.

The syntax commences with showing the analogy of elements, words, and speech. In each of these we have repetition, omission, conjunction, transposition, etc. (*xvii. 3 sq.*). Then Priscian discusses why interrogatives are all of two parts of speech only, viz., nouns and adverbs (*ib.* 22): why not also verbs (*ib.* 36)? He discusses the difference of pronouns from one another, their use with impersonals, particularly *interest, refert* (*ib.* 92), the use of the possessive and reflexive pronouns. He says that *mei ager* may be used for *meus ager*, but also for "the land of my husband" (*ib.* 129, 130). There are many possible unions and interchanges of different parts of speech and of their accidents. Such unions as *ille ego qui quondam*, etc., are justified analogically by the union of different cases, e.g., *animalium quædam sunt mortalia*, or by the rise of compounds from different cases, as *mediterraneus a medio terræ* (*ib.* 144-152). Different numbers and genders are combined, as *pars secant; aperite aliquis; in Eunuchum suam*; or different cases, as *urbem quam statuo vestra est*; or different times, as *postquam cecidit . . . Ilium et omnis humo fumat Troja* (*ib.* 155-163). Often we find interchange, e.g., of parts of speech, as *sublime (volas) for an adverb, genus unde Latinum for ex quo*, etc. (*ib.* 168).

In the eighteenth book he discusses the use of the cases. The nominative and vocative are absolute, and with substantival or vocative verbs of the first or second person they do not require a pronoun, e.g., *homo sum, Cicerō nominor*, but with other verbs they do, e.g., *ego Priscianus scribotu Apollonius or (Apolloni) scribis. Tu* may, however, be omitted with the vocative, but *Priscianus scribo* is a solecism, because nouns by themselves and participles, without the vocative case, are of the third person (*ib.* 2-4). If a noun requires an oblique case, we must have the verb substantive or participle, e.g., *filius Herculis sum*. In *filius Pelei Achilles multos interfecit*, the participle *ens* ("for which we now use *qui est* or *qui fuit*") must be understood (*ib.* 6.). The nominative is joined to the genitive when possession and a possessor are meant. In *Hector filius Priami* the genitive denotes the possessor; in *magnæ virtutis vir* it denotes the possession. In the latter use the Latins often have the ablative, as they have also for the Greek genitive of consequence, *ἰσὺς ζῶντος*=*me vivo* (*ib.* 14). The genitive after comparatives and superlatives and after verbals in *-or* and *-rix* is mentioned; also such usages as *fidens animi, dives lactis* (*ib.* 18, 19). In *doctus grammaticam* we have a participle; in *doctus grammaticæ* a noun (*ib.* 21). The dative is used acquisitively, e.g., *commodus tibi sum*, also after verbals in *-lis* and *-dus*. Words of equivalence or subjection or the reverse are used in any order with either genitive or dative, e.g., *pater filii, or filio est pater; so similis, par, amicus*, etc. Nominatives are joined to accusatives when what belongs to a part is assigned to the whole, e.g., *fortis dextram for fortem dextram habens*. In all (even in oblique) cases we must understand *qui est*, as *albi colorem equi*=*equi ejus qui est albi coloris* (*ib.* 27). The ablative is joined to the nominative to express the instrument, the possession, the consequence (see above). It is used also with words of passive meaning, e.g., *viduus pharetra, dignus morte*, and in comparisons (*ib.* 32). He then proceeds (in awkward language) to point out that the nominative which is joined to a verb remains unchanged, and either takes no oblique cases of another declinable word or only such as are construed with the verb, e.g., *Terentius ambulat; Cæsar vincit Pompeium; pater indulget filio*. But the nominative, which in consequence of the nature of the noun itself takes oblique cases, takes those

cases, be its own case what it may; e.g., *victor Pompeii Cæsar interfectus est a Bruto; victoris Pompeii Cæsaris filia fuit Julia; victori Pompeii Cæsari*, etc. (*ib.* 35, 36). Similarly datives like *curæ, cordi*, etc., are used with all cases, e.g., *cordi hominis for jucundi hominis* (*ib.* 38; xi. 24). Priscian would have found it difficult to give an instance of this.

The syntax of the verb follows. The infinite is taken first as the most general. Infinitives are often joined to nouns, e.g., *bonum est legere*, and, by a beautiful figure, to adjectives, e.g., *fortis bellare*; also to verbs and participles (*xviii. 40-46*). All verbs may be resolved into infinitives, e.g., *ambulo*=*dico me ambulare, scribebam*=*scribere cepi*. Hence *cepit* was sometimes omitted, e.g., *ego illud sedulo negare factum* (*ib.* 48). Participials and supines have the same case as the verb; verbal nouns in *-dus* have the same case as the nouns to which they are joined (*ib.* 61-63). All transitive verbs are joined either to a genitive or dative or accusative or ablative, e.g., *ego tui, insidior tibi*, etc. Similarly participials or supines, e.g., *misereundo tui moveor, nocitum tibi proprio, nocitu tibi gaudet* (*ib.* 61).

An instance of the last would be hard to find.

The uses of indicative, imperative, and optative moods are briefly treated. The subjunctive, which is the same in form as the optative (*ib.* 82), requires always to be joined to another mood or to another verb of the same mood. It is especially frequent with *si*, when expressing doubt and put for *iav* (*ib.* 80). With the indicative *si* used for *et* shows confirmation and belief. In *siqua id fortuna vetabit, vetabit* is put *metri gratia* for *vetet*. The subjunctive expresses doubt or approval or possibility, e.g., *doubt in eloquar an sileam*, approval in *si non pertesum thalami tædæque fuisset, where fuisset*=*ἐγγύοναι ἄρα*. *Ut* and *qui, quæ, quod*, giving a reason or expressing a doubt, are often used with subjunctive (*ib.* 82-93). In discussing *ut* for *iua*, his examples carefully give the same tense of the principal verb (whether indicative or subjunctive) as that of the dependent subjunctive, e.g., *doces ut proficias, doceres ut proficeris, docuisti ut profeceris, docuisses ut profecisses, docebis ut profeceris* (future subjunctive). But he also notes that *fecissem* or *facerem* are equally right with *nisi impedires*, and that *faciam* or *fecero* is used with either *nisi impedias* or *impedires* (*ib.* 101-104).

After then discussing the cases used after verbs according to the meaning of the verbs as transitive, passive, common, absolute (e.g., *rubeo pudore*), or expressing various affections of the body or mind (*ib.* 127-167), he proceeds to the long list of idioms spoken of above.

Priscian's three short treatises dedicated to Symmachus are on weights and measures, the metres of Terence, and some rhetorical elements. He also wrote *De nomine, pronomine, et verbo* (an abridgment of part of his *Institutiones*), and an interesting specimen of the school teaching of grammar in the shape of complete parsing by question and answer of the first twelve lines of the *Æneid* (*Partitiones xii. versuum Æneidos principalium*). The metre is discussed first, each verse is scanned, and each word thoroughly and instructively examined. Its meaning, its form, its accent, its class, its other cases or tenses, its compounds and derivatives are all required from the pupil, as well as the rules to which they ought to conform. Such parsing, rarely, if ever takes place in modern schools. A treatise on accents is ascribed to Priscian, but is rejected by modern writers on the ground of matter and language. He also wrote two poems, not in any way remarkable, viz., a panegyric on Anastasius in 312 hexameters with a short iambic introduction, and a faithful translation into 1087 hexameters of Dionysius's *Periegesis* or geographical survey of the world. A few passages have, says Bernhardt, been altered by Priscian on account of their heathen contents.

The grammatical treatises have been critically edited, in excellent fashion, in Keil's *Grammatici Latini*, vols. ii. and iii., 1855-60; the *Institutiones* by Martin Hertz; and the smaller treatises by Keil. The poems have been recently edited by Bährens, in his *Poetæ Latini Minores*, vol. v., 1883. (H. J. R.)

PRISCILLIANISTS, an heretical sect which rose to some prominence in Spain towards the end of the 4th century and continued to subsist, in varying numbers, there and in Gaul, until after the middle of the 6th. Its founder was Priscillian, a wealthy and influential layman of considerable reading and ability who had devoted his life to a self-denying study of the occult sciences and the deeper problems of philosophy. In the course of his speculations he came under the influence of two teachers, Elpidius and Agape, who professed to have derived their views from a certain Marcus, a native of Egypt who had settled in Spain. The creed which Priscillian now formulated appears to have combined various features of Gnosticism and Manichæism; he seems, for example, to have held

the theory of emanations—high in rank among these being the heavenly powers whom he called by the name of the twelve patriarchs, and brought also into close relations with the signs of the zodiac—the doctrine of the demiurge, the pre-existence of souls, the eternity of the devil, the essential sinfulness of the flesh, the unlawfulness of procreation, and the like. He and his followers retained their connection with the Catholic Church,—insisting, however, on fasting on Sundays, and refusing the bread in the sacrament; but they also held separate meetings in private at which they were accused by their adversaries (with what truth is not known) of practicing magic and indulging in licentious orgies. Many women joined the sect, and among the more prominent of its converts were two bishops, named Instantius and Salvianus. Bishop Hyginus of Cordova, who had been the first to raise the alarm against the new doctrines and practices, himself soon afterwards joined the sect; but through the exertions of Idacius of Emerita the leading Priscillianists, who had failed to appear before the synod of Spanish and Aquitanian bishops to which they had been summoned, were excommunicated at Saragossa in October, 380. The same synod passed certain canons against the heresy, and Ithacius of Ossunuba was charged with the publication of its decisions. Meanwhile, however, Priscillian was made bishop of Avila, and the orthodox party found it necessary to appeal to the emperor (Gratian), who issued an edict threatening the sectarian leaders with banishment. Priscillian, Instantius, and Salvianus now passed through Gaul to Italy with the object of enlisting the sympathies of Ambrose of Milan and Pope Damasus, but without result. They succeeded, however, by bribing the proconsul, it is said, in procuring the withdrawal of Gratian's edict, and the attempted arrest of Ithacius. With the murder of Gratian and accession of Maximus (383) the aspect of matters again changed; Ithacius fled to Treves, and in consequence of his representations, a synod was held (384) at Bordeaux where Instantius was deposed. Priscillian for his part appealed to the emperor, with the unexpected result that along with six of his companions he was condemned to death and executed at Treves, in 385. This first instance of the application of the Theodosian law against heretics caused a profound sensation throughout the Catholic world; it had the approval of the synod which met at Treves in the same year, but Ambrose of Milan and Martin of Tours can claim the glory of having lifted up their voices against it, and of having in some measure stayed the hand of persecution. The heresy, notwithstanding the severe measures taken against it, continued to spread in France as well as in Spain; and the barbarian invasions of the 5th century appear to have helped its further diffusion. About 444 it attracted the attention of Leo I. at Rome, along with other forms of Manichæism, and something was done for its repression by a synod held at the pope's instance by Turribius of Astorga in 446 and by that of Toledo in 447; as an openly professed creed it wholly disappeared after the second synod of Braga in 563.

PRISHTINA, or PRISTINA, a town of European Turkey, since 1877 at the head of a liwa in the vilayet of Kossovo, lies on an affluent of the Sitnitz, a tributary of the Morava, and gives its name to one of the stations on the Salonica-Uskub-Mitrowica Railway, which runs at a distance of 6 or 7 miles to the west of the town. It stands at a height of 1700 feet above the sea on undulating ground, and presents in the distance a pleasant appearance with the minarets erected, according to the legend, by Turkish women whose husbands fell in the battle of Kossovo fought in the neighborhood. Prishtina is the seat of a Greek bishop. Its population is estimated at from 8000 to 10,000. To the southeast lies the partly ruined monastery of Gratchanitz, founded by King Milutin of Servia, who reigned from 1275 to 1321. It is a graceful building with a large central dome surrounded by four smaller

domes and a variety of arches, of which the higher are pointed and the lower round. Among the frescos are portraits of the founder and his queen Simonida, daughter of Andronicus II. Palæologus, and a remarkable head of Christ in the dome. See Mackenzie and Irby, *The Slavonic Provinces of Turkey*.

PRISON DISCIPLINE. Authority in every age and in every country has claimed to impose penalties on all who offend against it. Either coercion or protection has been the moving principle; the master extorted submission, or society, through its rulers, defended itself against evil doers. The most common punishments in early times were naturally those most easily inflicted. Offenders paid in their persons: they were put to death with every variety of the capital sentence, were branded, mutilated, or sold as slaves. They were fined also, were degraded, or forfeited civil rights, or yet again were simply banished from their homes. Enforced detention, incarceration within four walls, was another method of coercion which grew and gained favor under the feudal system. The lord temporal or spiritual or corporate body could thus hold the vassal safe until he yielded fealty or submitted to extortion. A dungeon told no tales, and served conveniently to bury the victims of mediæval oppression. The unrestrained and unjustifiable exercise of the power to imprison lingered long in lands where personal liberty was unknown; nor did arbitrary imprisonment terminate with the destruction of the Bastille. In England, however, freedom from illegal arrest, the dearest of the Briton's privileges, was resolutely fought for and early achieved. The Great Charters conceded it; and, although often in danger, it was confirmed finally and beyond all question by the Habeas Corpus Act passed in the reign of Charles II. But the theory was better than the practice: numbers always languished in jail, the victims of needlessly severe or misinterpreted laws, who nowadays would have been at large. Through long years of trouble and disquiet, when the country was torn with religious and political dissensions, the prisons were always full. Intolerance appealed to the strong arm, and the jail was the antechamber of the scaffold or stake. When party warfare ran high, when kings struggled for larger powers or their ministers and myrmidons ruled with a high hand, incarceration was the easy recompense for all on the losing side. The commercial laws of a nation wedded to trade kept a large contingent always in jail. The debtor was at the mercy of his creditor, who could command the best efforts of the law to assist him in recovering his own again. Irregularity in the administration of justice contributed largely to fill the prisons. Jail deliveries were frequently delayed indefinitely; while, even when tardy trial ended in an acquittal, release was not always accorded, and innocent men, unable to meet extortionate demands in fees, were carried back to prison. This was one reason why jails were full; yet another was the laxity or entire absence of discipline which suffered the families of accused persons to share their confinement. Under such conditions, more or less universal, the state of prisons, not in England alone, but throughout the then civilized world, was deplorable in the extreme. Yet the terrors of incarceration were long but vaguely understood. Glimpses of light sometimes penetrated the dark recesses of the prison house, as when the atrocities perpetrated by the keepers of the chief debtors' prisons in London were made the subject of parliamentary inquiry. This was in 1730, forty-three years before the revelations of Howard. But in the interval voices were occasionally raised in protest, and there was a general sense of uneasiness throughout the country to which the great philanthropist gave point and expression. Howard began his journeys of inspection in 1773; in the following year he was examined by the House of Commons, and received the thanks of the House for his arduous and self-sacrificing labors for the mitigation of suffering in jails. What Howard

found is sufficiently well known. The prisons of the kingdom were a disgrace to humanity: they were for the most part poisonous pestiferous dens, densely overcrowded, dark, foully dirty, not only ill-ventilated, but deprived altogether of fresh air. The wretched inmates were thrown into subterranean dungeons, into wet and noisome caverns and hideous holes to rot and fester, a prey to fell disease bred and propagated in the prison house, and deprived of the commonest necessities of life. For food they were dependent upon the caprice of their jailers or the charity of the benevolent; water was denied them except in the scantiest proportions; they were half naked or in rags; their only bedding was putrid straw reeking with exhalations and accumulated filth. Every one in durance, whether tried or untried, was heavily ironed; women did not escape the infliction. All alike were subject to the rapacity of their jailers and the extortions of their fellows. Jail fees were levied ruthlessly—"garnish" also, the tax or contribution paid by each individual to a common fund to be spent by the whole body, generally in drink. Drunkenness was universal and quite unchecked; gambling of all kinds was practiced; vice and obscenity were everywhere in the ascendant. Idleness, drunkenness, vicious intercourse, sickness, starvation, squalor, cruelty, chains, awful oppression, and everywhere culpable neglect—in these words may be summed up the state of the jails at the time of Howard's visitation.

It must be borne in mind that all this time the prisons were primarily places of detention, not of punishment. The bulk of those committed to their safe keeping were accused persons awaiting trial in due process of law, or debtors; and of these again by far the most numerous class were the impecunious and the unfortunate, whom a mistaken system looked up and deprived of all means of paying their liabilities. Now and again an offender was sentenced to be imprisoned in default of payment of fine, or to pass the intervals between certain periods of disgraceful exposure on the pillory. Imprisonment had as yet no regular place in the code of penalties, and the jail was only the temporary lodging of culprits duly tried and sentenced according to law. The punishment most in favor in these ruthless times was death. The statute-book bristled with capital felonies, and the gallows was in perpetual requisition. These were days when the pickpocket was hanged; so was the sheep-stealer, and the forger of one-pound notes. Well might Sir Samuel Romilly, to whose strenuous exertions the amelioration of the penal code is in a great measure due, declare that the laws of England were written in blood. But even then there was another and a less sanguinary penalty. The deportation of criminals beyond seas grew naturally out of the laws which prescribed banishment for certain offences. The Vagrancy Act of Elizabeth's reign contained in it the germ of transportation, by empowering justices in quarter sessions to banish offenders and order them to be conveyed into such parts beyond the seas as should be assigned by Her Majesty's privy council. Full effect was given to this statute in the next reign, as is proved by a letter of James I., dated 1619, in which the king directs "a hundred dissolute persons" to be sent to Virginia. Another Act of similar tenor was passed in the reign of Charles II., in which the term "transportation" appears to have been first used. A further and more systematic development of the system of transportation took place in 1718, when an Act was passed by which offenders who had escaped the death penalty were handed over to contractors, who engaged to transport them to the American colonies. These contractors were vested with a property in the labor of the convicts for a certain term, generally from seven to fourteen years, and this right they frequently sold. Labor in those early days was scarce in the new settlements; and before the general adoption of negro slavery there was a keen competition for felon hands. The demand

was indeed so great that it produced illegal methods of supply. An organized system of kidnapping prevailed along the British coasts; young lads were seized and sold into what was practically white slavery in the American plantations. These malpractices were checked, but the legitimate traffic in convict labor continued until it was ended peremptorily by the revolt of the American colonies and the achievement of their independence. In 1776 the British legislature, making a virtue of necessity, discovered that transportation to His Majesty's colonies (which three years previously had declared their independence¹) was bound to be attended by various inconveniences, particularly by depriving the kingdom of many subjects whose labor might be useful to the community; and an Act was accordingly passed which provided that convicts sentenced to transportation might be employed at hard labor at home. At the same time the consideration of some scheme for their disposal was entrusted to three eminent public men—Sir William Blackstone, Mr. Eden (afterwards Lord Auckland), and John Howard. The result of their labors was an Act for the establishment of penitentiary houses, dated 1778. This Act is of peculiar importance. It contains the first public enunciation of a general principle of penal treatment, and shows that even at that early date the system since nearly universally adopted was fully understood. The object in view was thus stated. It was hoped, by sobriety, cleanliness, and medical assistance, by a regular series of labor, by solitary confinement during the intervals of work, and by due religious instruction, to preserve and amend the health of the unhappy offenders, to inure them to habits of industry, to guard them from pernicious company, to accustom them to serious reflection, and to teach them both the principles and practice of every Christian and moral duty. The experience of a century has added nothing to these the true principles of penal discipline; they form the basis of every species of prison system carried out since the passing of the Act 19 Geo. III. c 74 in 1779.

The first step towards giving effect to this Act was the appointment of a commission of three "super-visors" to select and acquire a site for the first penitentiary house. Howard was one, and no doubt the most influential, of these; but he could not agree with his colleagues as to the most suitable situation. One was for Islington, another for Limehouse, while Howard insisted upon some site which was healthy, well supplied with water, and in such a convenient spot that it could be readily visited and inspected. It is interesting to observe that the great philanthropist anticipated modern English practice in his preparation of the plans for the construction of the prison. He was strongly of opinion that the penitentiary should be built by convict labor, just as in recent years the new prison has been erected at Wormwood Scrubs, Portsmouth, and Dartmoor. Howard, however, withdrew from the commission, and new supervisors were appointed, who were on the eve of commencing the first penitentiary when the discoveries of Captain Cook in the South Seas turned the attention of the Government towards these new lands. The vast territories of Australasia promised an unlimited field for convict colonization, and for the moment the scheme for penitentiary houses fell to the ground. Public opinion generally preferred the idea of establishing penal settlements at a distance from home. "There was general confidence," says Merivale in his work on colonization, "in the favorite theory that the best mode of punishing offenders was that which removed them from the scene of offence and temptation, cut them off by a great gulf of space from all their former connections, and gave them the opportunity of redeeming past crimes by becoming useful members of society." These views

¹ [The Declaration of Independence was passed in the same year.—AM. ED.]

so far prevailed that an expedition consisting of nine transports and two men-of-war, the "first fleet" of Australian annals, sailed in March, 1787, for New South Wales. This first fleet reached Botany Bay in January, 1788, but passed on and landed at Port Jackson, where it entered and occupied the harbor of Sydney, one of the finest and most secure havens in the world. We shall return further on to the proceedings of these first criminal colonists when the progress of transportation as a secondary punishment will be described.

The penitentiary scheme was not, however, abandoned on the adoption of transportation to New South Wales. It was revived and kept alive by Jeremy Bentham, who in 1791 published a work on prison discipline entitled *The Panopticon or Inspection House*, and followed it next year by a formal proposal to erect a prison house on his own plan. Bentham's main idea was "a circular building, an iron cage glazed, a glass lantern as large as Ranelagh, with the cells on the outer circumference." Within, in the centre, an inspection station was so fixed that every cell or part of a cell could be at all times closely observed,—the prisoners being themselves at liberty to communicate with visitors and make known their complaints by means of tubes. He hoped to effect much in the way of reformation from a system of solitude or limited seclusion, with constant employment on work in the profits of which the prisoners were to share. His project was warmly approved by Pitt, but secret influences—the personal hostility, it was said, of George III. to Bentham as an advanced Radical, hindered its adoption until 1794. A contract was then made between the treasury and Bentham, by which the latter was to erect a prison for a thousand convicts, with chapel and other necessary buildings, for £19,000 [\$92,340]. A portion of this sum was advanced, and Bentham also acquired on behalf of the Government certain lands in the neighborhood of Tothill Fields. But the undertaking languished, and never took practical shape. Nearly fifteen years later, when the penitentiary question was again revived, Bentham's claims were referred to arbitration, and the Government proceeded to erect the prison on its own account, "fully recognizing the importance of attempting reformation by the seclusion, employment, and religious instruction of prisoners." This had been tried already on a small scale but with satisfactory results, first at the Gloucester prison erected in 1791 and afterwards in the house of correction at Southwell. A larger and more ambitious experiment was resolved upon, worthy of the state; and the great penitentiary still standing after many vicissitudes, but practically unaltered, at Millbank, was the result of this determination. It was built on the lands originally acquired by Bentham, and the work commenced in 1813 was continued at great outlay until 1816, when a portion was ready for the reception of prisoners. A great flourish attended its opening. Its affairs were entrusted to a specially appointed committee of eminent and distinguished personages, the chairman being the Speaker of the House of Commons. Crowds of visitors—royal dukes, foreign princes, the élite of society—came to see the new prison; most elaborate arrangements were made for its internal government, and no money was spared either upon the staff or upon the completion of the buildings. The sum total expended upon the latter amounted to half a million of money [\$2,430,000], and the yearly charges of the establishment were a heavy burthen on the exchequer.

The erection of Millbank was, however, a step in the right direction. The energy with which it was undertaken was the more remarkable because elsewhere throughout the United Kingdom the prisons, with but few exceptions, remained deplorably bad. Mr. Neild, who in 1812 followed in the footsteps of John Howard, found that the old conditions, overcrowding and indiscriminate intercourse, remained

unchanged. "The great reformation produced by Howard," to use Neild's own words, "was merely temporary; . . . prisons were relapsing into their former horrid state of privation, filthiness, severity, and neglect." Yet the legislature was alive to the need for prison reform. Besides the building of Millbank it had promulgated many Acts for the amelioration of prisoners. Jail fees were once more distinctly abolished; the appointment of chaplains was insisted upon; the erection of improved prison buildings was rendered imperative upon local authorities. But these with other and much older Acts remained in abeyance. Thus an Act which provided for the classification of prisoners had remained a dead letter; even the separation of the males from the females was not an universal rule. Humane provisions intended to secure the good government of prisons, their cleanliness and ventilation and the proper supply of food, clothing and bedding to the prisoners were still systematically ignored. Roused by these crying evils a small band of earnest men, philanthropists and members of the Society of Friends, formed themselves into an association for the improvement of prison discipline and devoted themselves with rare energy and singleness of purpose to their self-constituted task. They perambulated the country inspecting all the prisons; they issued lengthy interrogatories to prison officials; they published periodical reports giving the result of their inquiries, with their views on the true principles of prison management and much sound advice, accompanied by elaborate plans, on the subject of prison construction. The labors of this society brought out into strong relief the naked deformity of the bulk of the British jails. It was the old story. Jails, speaking broadly, were lamentably inadequate for the numbers crowded into them. Hence there was the most terrible overcrowding. By day in some prisons it was nearly impossible to push through the throngs in the yards; by night the wretched prisoners ran the risk of suffocation. Prisoners were still very generally obliged to wear heavy irons. They had no regular diet—at best only dry bread. Speaking of St. Alban's from his personal observation, Mr. Buxton, a most active member of the Society, says, "All were in ill-health; almost all were in rags; almost all were filthy in the extreme. The state of the prison, the desperation of the prisoners, broadly hinted in their conversation and plainly expressed in their conduct, the uproar of oaths, complaints and obscenity, the indescribable stench, presented together a concentration of the utmost misery and the utmost guilt." This was no over-colored picture, nor did it portray a solitary instance. The reports of the Society laid bare the existence of similar horrors in numbers of other jails. Yet this was in 1818, when the legislature was setting a praiseworthy example—when half a million had been spent in providing large airy cells for a thousand prisoners. Even in London itself, within easy reach of this palatial Millbank penitentiary, the chief prison of the city, Newgate, was in a disgraceful condition. This had been exposed by a parliamentary inquiry as far back as 1814, but nothing had been done to remedy the evils laid bare. All the shameful conditions of neglect, ill-treatment and overcrowding were present in Newgate and to the same extent as in any of the provincial prisons. The state of the female side had already attracted the attention of that devoted woman, Mrs. Fry, whose ministrations and wonderful success no doubt encouraged, if they did not bring about, the formation of the Prison Society. Mrs. Fry went first to Newgate in 1813, but only as a casual visitor. It was not till 1817 that she entered upon the great and noble work with which her name will ever be associated. She worked a miracle there in an incredibly short space of time. The ward into which she penetrated, although strongly dissuaded by the officials, was like a den of wild beasts, it was filled with women unsexed, fighting, swearing, dancing, gaming, yelling,

and justly deserved its name of "hell above ground." Within a month it was transformed, and presented, says an eye-witness, "a scene where stillness and propriety reigned." The wild beasts were tamed. It was not strange that such marvellous results should be bruited abroad, that public attention should be attracted to Mrs. Fry's labors and that others should seek to follow in her footsteps. Movements similar to that which Mrs. Fry headed were soon set on foot both in England and on the Continent, and public attention was generally directed to the urgent necessity for prison reform.

Stimulated no doubt by the success achieved by Mrs. Fry, the Prison Discipline Society continued its useful labors. Hostile critics were not wanting; many voices were raised in protest against the ultra-humanitarianism which sought to make jails too comfortable and tended to pamper criminals. But the society pursued its way undeterred by sarcasm, through evil and good report, striving earnestly after the objects it had in view. Many of these are now accepted as axioms in prison treatment. It is, for instance, established beyond question that female officers only should have charge of female prisoners, that prisoners of both sexes should be kept constantly employed. Yet these principles were unacknowledged at that time and were first enunciated in Acts such as the 4 Geo. IV. c. 65 and the 5 Geo. IV. c. 85 (1823-24), the passing of which were mainly due to the strenuous exertions of the Prison Discipline Society. It was laid down in these that over and above safe custody it was essential to preserve health, improve morals and enforce hard labor on all prisoners sentenced to it. These Acts also provided that male and female prisoners should be confined in separate buildings, that matrons should be appointed, and schoolmasters, and that there should be divine service daily in the jails. Now at last irons were strictly forbidden except in cases of "urgent and absolute necessity," and it was ruled that every prisoner should have a bed to himself—if possible, a separate cell, the last being the first formal statement of a principle upon which all future prison discipline was to be based.

The importance of these Acts cannot be over-estimated as supplying a legal standard of efficiency by which all prisons could be measured. Still the progress of improvement was extremely slow, and years after the managers of jails still evaded or ignored the Acts. Many local authorities grudged the money to rebuild or enlarge their jails; others varied much in their interpretation of the rules as to hard labor and the hours of employment. One great drawback to general reform was that a large number of small prisons lay beyond the reach of the law. Those under small jurisdictions in the boroughs and under the petty corporate bodies continued open to the strongest reprobation. Not only were they wanting in all the indispensable requirements as laid down by the most recent Acts, but they were often unfit for the confinement of human beings, and were described "as fruitful sources of vice and misery, debasing all who are confined within their walls." They thus remained until they were swept away by the measure which brought about the reform of the municipal corporations in 1835. But by this time a still more determined effort had been made to establish some uniform and improved system of prison discipline. In 1831 a select committee of the House of Commons went into the whole subject of secondary punishment and reported that, as the difficulties in the way of an effective classification of prisoners were insurmountable, they were strongly in favor of the confinement of prisoners in separate cells, recommending that the whole of the prisons should be altered accordingly and the expense borne by the public exchequer. There can be little doubt that this committee, like every one just then, was greatly struck by the superior methods of prison discipline pursued in the United States. The best American

prisons had recently been visited by two eminent Frenchmen, MM. Beaumont and De Tocqueville, who spoke of them in terms of the highest praise. It was with the object of appropriating what was best in the American system that Mr. Crawford was dispatched across the Atlantic on a special mission of inquiry. His able and exhaustive report, published in 1834, was a valuable contribution to the whole question of penal discipline and it was closely and attentively studied at the time. Another select committee, this time of the House of Lords, returned to the subject in 1835, and after a long investigation re-enunciated the theory that all prisoners should be kept separate and apart from one another. It also urged in strong terms the necessity for one uniform system of treatment, more especially as regarded dietaries, labor and education, and strongly recommended the appointment of official inspectors to enforce obedience to the Acts. These recommendations were eventually adopted and formed the basis of a new departure. This was the first indication of a system which, although greatly modified, enlarged and improved, is in its main outlines the same as that now in force.

It must, however, be borne in mind that the prisons at home still formed an item only, and not the largest, in the scheme of secondary punishment. The jail was only a place of temporary detention, where prisoners awaited trial, suffered short terms of imprisonment, or passed on to the gallows or the penal colonies. The last-named was the chief outlet, for by this time the country was fully committed to the system of deportation. Since the first fleet in 1787 convicts had been sent out in constantly increasing numbers to the antipodes. Yet the early settlement at Sydney had not greatly prospered. The infant colony, composed of such incongruous materials, of guards and criminals, had had a bitter struggle for existence. It had been hoped that the community would raise its own produce and speedily become self-supporting. But the soil was unfruitful; the convicts knew nothing of farming; there was no one fully competent to instruct them in agriculture. All lived upon rations sent out from home; and when convoys with relief lingered by the way famine stared all in the face. The colony was long a penal settlement and nothing more, peopled only by two classes, convicts and their masters—criminal bondsmen on the one hand who had forfeited their independence and were bound to labor without wages for the state, on the other officials to guard and exact the due performance of tasks. From the first it had been felt that the formation of a steady respectable class was essential to the future healthy life of the colony. But such an element was not easy to infuse into the community. A few free families were encouraged to emigrate, but they were lost in the mass they were intended to leaven, swamped and outnumbered by the convicts, shiploads of whom continued to pour in year after year. As the influx increased difficulties arose as to their employment. Free settlers were too few to give work to more than a small proportion. Moreover, a new policy was in the ascendant, initiated by Governor Macquarie, who considered the convicts and their rehabilitation his chief care, and steadily discouraged the immigration of any but those who "came out for their country's good." The great bulk of the convict labor thus remained in Government hands. This period marked the first phase in the history of transportation. The penal colony, having triumphed over early dangers and difficulties, was crowded with convicts in a state of semi-freedom, maintained at the public expense, and utilized in the development of the latent resources of the country. The methods employed by Governor Macquarie were not perhaps invariably the best; the time was hardly ripe as yet for the erection of palatial buildings in Sydney, while the congregation of the workmen in large bodies tended greatly to their demoralization. But some of the works undertaken and carried out were of incalculable service to the young colony; and its early advance in wealth and prosperity was greatly due to the magnificent roads, bridges, and other facilities of inter-communication for which it was indebted to Governor Macquarie.

But now the criminal sewage flowing from the Old World to the New was greatly increased in volume under milder and more humane laws. Many now escaped the gallows, and much of the overcrowding of the jails at home already mentioned was caused by the gangs of convicts awaiting transshipment to the antipodes. They were packed off, however, with all convenient despatch, and the numbers on Government hands in the colonies multiplied exceedingly,

causing increasing embarrassment as to their disposal. Moreover, the expense of the Australian convict establishments was enormous, and some change in system was inevitable. These were the conditions that brought about the plan of "assignments," in other words of freely lending the convicts to any who would relieve the authorities of the burdensome charge. By this time free settlers were arriving in greater number, invited by a different and more liberal policy than that of Governor Macquarie. Inducements were especially offered to persons possessed of capital to venture in the development of the country. Assignment developed rapidly; soon eager competition arose for the convict hands that were at first very reluctantly taken. Great facilities existed for utilizing them on the wide areas of grazing land and on the new stations in the interior. A pastoral life, without temptations and contaminating influences, was well suited for convicts. As the colony grew richer and more populous, other than agricultural employers became assignees, and numerous enterprises were set on foot. The trades and callings which minister to the needs of all civilized communities were more and more largely pursued. There was plenty of work for skilled convicts in the towns, and the services of the more intelligent were highly prized. It was a great boon to secure gratis the assistance of men specially trained as clerks, book-keepers, or handicraftsmen. Hence all manner of intrigues and manoeuvres were set going on the arrival of drafts, and there was a scramble for the best hands. Here at once was a flaw in the system of assignment. The lot of the convict was altogether unequal. Some, the dull unlettered and unskilled, were drafted to heavy manual labor at which they remained, while clever and expert rogues found pleasant, congenial, and often profitable employment. The contrast was very marked from the first, but it became the more apparent, the anomaly more monstrous, as time passed on and some were still engaged in unlovely toil while others, who had come out by the same ship, had already attained to affluence and ease. For the latter transportation was no punishment, but often the reverse. It meant too often transfer to a new world under conditions more favorable to success, removed from the keener competition of the old. By adroit management, too, they often obtained the command of funds, the product of nefarious transactions at home, which wives or near relatives or unconvicted accomplices presently brought out to them. It was easy for the free new-comers to secure the assignment of their convict friends; and the latter, although still nominally servants and in the background, at once assumed the real control. Another system productive of much evil was the employment of convict clerks in positions of trust in various Government offices; convicts did much of the legal work of the colony; a convict was clerk to the attorney-general; others were schoolmasters, and were entrusted with the education of youth.

Under a system so anomalous and uncertain the main object of transportation as a method of penal discipline and repression was in danger of being quite overlooked. Yet the state could not entirely abdicate its functions, although it surrendered to a great extent the care of criminals to private persons. It had established a code of penalties for the coercion of the ill-conducted, while it kept the worst, perforce, in its own hands. The master was always at liberty to appeal to the strong arm of the law. A message carried to a neighboring magistrate, often by the culprit himself, brought down the prompt retribution of the lash. Convicts might be flogged for petty offences, for idleness, drunkenness, turbulence, absconding, and so forth. At the out-stations some show of decorum and regularity was observed, although the work done was generally scanty, and the convicts were secretly given to all manner of evil courses. The town convicts were worse, because they were far less under control. They were nominally under the surveillance and supervision of the police, which amounted to nothing at all. They came and went, and amused themselves after working hours, so that Sydney and all the large towns were hot-beds of vice and immorality. The masters as a rule made no attempt to watch over their charges; many of them were absolutely unfitted to do so, being themselves of low character, "emancipists" frequently, old convicts pardoned or who had finished their terms. No effort was made to prevent the assignment of convicts to improper persons; every applicant got what he wanted, even though his own character would not bear inspection. All whom the masters could not manage—the incorrigibles upon whom lash and bread and water had been tried in vain—were returned to Government charge. These, in a word, comprised the whole of the refuse of colonial conviction. Every man who could not agree with his master, or who was to undergo a penalty greater than flogging or less than capital punishment, came back to Government, and was disposed

of in one of three ways—the road parties, the chain gangs, or the penal settlements. The convicts in the first might be kept in the vicinity of the towns or marched about the country according to the work in hand; the labor was irksome, but, owing to inefficient supervision, never intolerable; the diet was ample, and there was no great restraint upon independence within certain wide limits. To the slackness of control over the road parties was directly traceable the frequent escape of desperadoes, who, defying recapture, recruited the gangs of bush-rangers, which were a constant terror to the whole country. In the chain or iron gangs, as they were sometimes styled, discipline was far more vigorous. It was maintained by the constant presence of a military guard, and, when most efficiently organized, was governed by a military officer who was also a magistrate. The work was really hard, the custody close—in hulk, stockaded barrack, or caravan; the first was at Sydney, the second in the interior, the last when the undertaking required constant change of place. All were locked up from sunset to sunrise; all wore heavy leg irons; and all were liable to immediate flagellation. The convict "scourger" was one of the regular officials attached to every chain gang. The third and ultimate receptacle was the penal settlement, to which no offenders were transferred till all other methods of treatment had failed. These were terrible cesspools of iniquity, so bad that it seemed, to use the words of one who knew them well, "the heart of a man who went to them was taken from him and he was given that of a beast." The horrors accumulated at Norfolk Island, Moreton Bay, Port Arthur, and Tasman's Peninsula are almost beyond description. The convicts herded together in them grew utterly degraded and brutalized; no wonder that reckless despair took possession of them, that death on the gallows for murder purposely committed, or the slow terror from starvation following escape into surrounding wilds, was often welcomed as a relief.

The stage which transportation was now reaching, and the actual condition of affairs in the Australian colonies about this period, do not appear to have been much understood in England. Earnest and thoughtful men might busy themselves with prison discipline at home, and the legislature might watch with peculiar interest the results obtained from the special treatment of a limited number of selected offenders in Millbank penitentiary. But for the great mass of criminality deported to a distant shore no very active concern was shown. The country for a long time seemed satisfied with transportation. Portions of the system might be open to criticism. Thus the Commons committee of 1832 freely condemned the hulks at Woolwich and other arsenals in which a large number of convicts were kept while waiting embarkation. The indiscriminate association of prisoners in them produced more vice, profaneness, and demoralization than in the ordinary prisons. After dark the wildest orgies went on in them—dancing, fighting, gambling, singing, and so forth; it was easy to get drink and tobacco, and see friends from outside. The labor hours were short, the tasks light; "altogether the situation of the convict" in the hulks, says the report, "cannot be considered penal; it is a state of restriction, but hardly of punishment." But this same committee spoke well of transportation, considering it "a most valuable expedient in the system of secondary punishment." All that it felt necessary to suggest was that exile should be preceded by a period of severe probationary punishment in England, a proposal which was reiterated later on and actually adopted, as we shall see. It was in the country most closely affected that dissatisfaction first began to find voice. Already in 1832 the most reputable sections of Australian society were beginning to find grave fault with transportation. It had fostered the growth of a strong party—that representing convict views—and these were advocated boldly in unprincipled prints. This party, constantly recruited from the emancipists and ticket-of-leave holders, gradually grew very numerous, and threatened soon to swamp the respectable and untainted parts of the community. As years passed the prevalence of crime, and the universally low tone of morality due to the convict element, became more and more noticeable, and created greater disgust. At length, in 1835, Judge Burton raised a loud protest, and in a charge to the grand jury of Sydney plainly intimated that transportation must cease. While it existed, he said, the colonies could never rise to their proper position; they could not claim free institutions; in a word, Australia suffered in its whole moral aspect. This bold but forcible language commanded attention. It was speedily echoed in England, and by none more eloquently than Archbishop Whately, who logically argued that transportation failed in all the leading requisites of any system of secondary punishment. It was not formidable—criminals did not dread it; it was not corrective, but tended obviously to

produce further moral debasement; it was not cheap—on the contrary it entailed great outlay without bringing any adequate returns. In the first most important object it had certainly failed. Transportation exercised no salutary terror in offenders; it was no longer exile to an unknown inhospitable region, but to one flowing with milk and honey, whither innumerable friends and associates had gone already. There was every chance of doing well in the new country. The most glowing descriptions came back of the wealth which any clever fellow might easily amass; stories were told and names mentioned of those who had made ample fortunes in Australia in a few years. As a matter of fact the convicts, or at least large numbers of them, had prospered exceedingly. Some had incomes of twenty [\$97,200], thirty [\$145,800], even forty thousand [\$194,400] pounds a year. They owned shops and farms and public houses and ships, drove in carriages, and kept up grand establishments. It could be no great punishment to be put within reach of such advantages. As regarded the deteriorating effects of the system, these were plainly manifest on the surface from the condition of the colony—the profligacy of the town, the leniency shown to crimes and those who had committed them. Down below, in the depths where the dregs rankled perpetually, in the openly sanctioned slavery called assignment, in the demoralizing chain gangs, and in the inexpressibly horrible penal settlements, were more abundant and more awful proofs of the general wickedness and corruption. Moreover, these appalling results were accompanied by a vast expenditure. The cost of the colonial convict establishments, with the passages out, amounted annually to upwards of £300,000 [\$1,458,000]; another hundred thousand [\$486,000] was expended on the military garrisons; and various items brought the whole outlay to about half a million [\$2,430,000] per annum. It may be argued that this was not a heavy price to pay for peopling a continent and laying the foundations of our vast Australasian empire. But that empire could never have expanded to its present dimensions if it had depended on convict immigration alone. There was a point, too, at which all development, all progress, would have come to a full stop had it not been relieved of its stigma as a penal colony.

That point was reached between 1835 and 1840, when a powerful party came into existence in New South Wales, pledged to procure the abandonment of transportation. A strongly hostile feeling was also gaining ground in England. In 1837 a new committee of the House of Commons had made a patient and searching investigation into the merits and demerits of the system, and freely condemned it. The Government had no choice but to give way; it could not ignore the protests of the colonists backed up by such an authoritative expression of opinion. In 1840 orders were issued to suspend the deportation of criminals to New South Wales. But what was to become of the convicts? It was impossible to keep them at home. The hulks, which might have served, had also failed; the faultiness of their internal management had been fully proved. The committee last mentioned had recommended the erection of more penitentiaries. But the costly experiment of Millbank had been barren of results. The model prison at Pentonville, now in process of construction under the pressure of a movement towards prison reform, could offer but limited accommodation. A proposal was put forward to construct convict barracks in the vicinity of the great arsenals; but this, which contained really the germ of the present British penal system, was premature. The Government in this dilemma steered a middle course, and resolved to adhere to transportation, but under a greatly modified and, it was hoped, much improved form. The colony of Van Diemen's Land, younger and less self-reliant than its neighbor, had also endured convict immigration, but had made no protest. It was resolved to direct the whole stream of deportation upon Van Diemen's Land, which was thus constituted one vast colonial prison. The main principle of the new system was one of probation; hence its name. All convicts were to pass through various stages and degrees of punishment according to their conduct and character. Some general dépot was needed where the necessary observation could be made, and it was found at Millbank penitentiary. Thence boys were sent to the prison for juveniles at Parkhurst; the most promising subjects among the adults were selected to undergo the experimental discipline of solitude and separation at Pentonville; less hopeful cases went to the hulks; and all adults alike passed on to the antipodes. Fresh stages awaited the convict on his arrival at Van Diemen's Land. The first was limited to "lifers" and colonial convicts sentenced a second time. It consisted in detention at one of the penal stations, either Norfolk Island or Tasman's Peninsula, where the disgraceful conditions already described continued unchanged to the very last. The second

stage received the larger number, who were subjected in it to gang labor, working under restraint in various parts of the colony. These probation stations, as they were called, were intended to inculcate habits of industry and subordination; they were provided with supervisors and religious instructors; and, had they not been soon tainted by the vicious virus brought to them by others arriving from the penal stations, they might have answered their purpose for a time. But they became as bad as the worst of the penal settlements, and contributed greatly to the deplorable breakdown of the whole system. The third stage, and the first step towards freedom, was the concession of a pass which permitted the convict to be at large under certain conditions to seek work for himself; the fourth was a ticket-of-leave, the possession of which allowed him to come and go much as he pleased; the fifth, and last, was absolute pardon, with the prospects of rehabilitation.

This scheme seemed admirable on paper; yet it failed completely when put into practice. Colonial resources were quite unable to bear the pressure. Within two or three years Van Diemen's Land was fairly inundated with convicts. Sixteen thousand were sent out in four years; the average annual draft in the colony was about thirty thousand, and this when there were only thirty-seven thousand free settlers. Half the whole number of convicts remained in Government hands and were kept in the probation gangs, engaged upon public works of great utility; but the other half, pass-holders and ticket-of-leave men in a state of semi-freedom, could get little or no employment. The supply greatly exceeded the demand; there were no hirers of labor. Had the colony been as large and as prosperous as its neighbor it could scarcely have absorbed the mass of workmen; but it was really on the verge of bankruptcy—its finances were embarrassed, its trades and industries at a standstill. But not only were the convicts idle; they were utterly depraved. It was soon found that the system which kept large bodies always together had a most pernicious effect upon their moral condition. "The congregation of criminals in large batches without adequate supervision meant simply wholesale widespread pollution," as was said at the time. These ever-present and constantly increasing evils forced the Government to reconsider its position; and in 1846 transportation to Van Diemen's Land was temporarily suspended for a couple of years, during which it was hoped some relief might be afforded. The formation of a new convict colony in North Australia had been contemplated; but the project, warmly espoused by Mr. Gladstone, then under secretary of state for the colonies, was presently abandoned; and it now became clear that no resumption of transportation was possible.

Some fresh scheme had to be devised, and that without delay. The task fell upon Sir George Grey¹ as home secretary, who, in dealing with it laid the foundations of the present British penal system. This system was to consist (1) of a limited period of separate confinement in a home prison or penitentiary, accompanied by industrial employment and moral training; (2) of hard labor at some public works prison either at home or abroad; and (3) of exile to a colony with a conditional pardon or ticket-of-leave. No pains were spared to give effect to this plan as soon as it was decided upon. Pentonville was available for the first phase; Millbank was also pressed into the service, and accommodation was hired in some of the best provincial prisons, as at Wakefield, Leicester, and elsewhere. Few facilities existed for carrying out the second stage, but they were speedily improvised. Although the hulks at home had been condemned, convict establishments in which these floating prisons still formed the principal part were organized at Bermuda and Gibraltar. Neither of these, it may be stated at once, was a conspicuous success; they were too remote for effective supervision; and, although they lingered on for some years, they were finally condemned. The chief efforts of the authorities were directed to the formation of public works prisons at home, and here the most satisfactory results were soon obtained. The construction of a harbor of refuge at Portland had been recommended in 1845; in 1847 an Act was passed to facilitate the purchase of land there, and a sum of money taken up in the estimates for the erection of a prison, which was commenced next year. At another point, Dartmoor, a prison already, stood available, although it had not been occupied since the last war, when ten thousand under Melbourne, suppressed Chartist insurrection in 1848, twice

¹ [Second baronet (1799-1882), under secretary for colonies and chancellor of duchy of Lancaster.—AM. ED.]

French and American prisoners had been incarcerated in it. A little reconstruction made Dartmoor into a modern jail, and in the waste lands around there was ample labor for any number of convict hands. Dartmoor was opened in 1850; two years later a convict prison was established at Portsmouth in connection with the dockyard, and another of the same class at Chatham in 1856. The works undertaken at these various stations were of national importance, and the results obtained extremely valuable, as will presently be shown. The usefulness of these public works prisons and the need for their development soon became apparent. Although the authorities still clung to the principle of transportation, that punishment grew more and more difficult to inflict. The third stage in Sir George Grey's scheme contemplated the enforced emigration of released convicts, whom the discipline of separation and public works was supposed to have purged and purified, and who would have better hopes of entering on a new career of honest industry in a new country than when thrown back among vicious associations at home. The theory was good, the practice difficult. No colony would accept these ticket-of-leave men as a gift. Van Diemen's Land, hitherto submissive, rebelled, and positively refused to receive them, even though this denial cut off the supply of labor, now urgently needed. Other colonies were no less resolute in their opposition. The appearance of a convict ship at the Cape of Good Hope nearly produced a revolt. Although Earl Grey addressed a circular to all colonial Governments, offering them the questionable boon of transportation, only one, the comparatively new colony of Western Australia, responded in the affirmative. But this single receptacle could not absorb a tithe of the whole number of convicts awaiting exile. It became necessary therefore to find some other means for the disposal of those so rapidly accumulating at home. Accordingly, in 1853 the first Penal Servitude Act was passed, substituting certain shorter sentences of penal servitude for transportation. It was only just to abbreviate the terms; under the old sentence the transportee knew that if well conducted he would spend the greater part of it in the comparative freedom of exile. But, although sentences were shortened, it was not thought safe to surrender all control over the released convict; and he was only granted a ticket-of-leave for the unexpired portion of his original sentence. But no effective supervision was maintained over these convicts at large. They speedily relapsed into crime; their numbers, as the years passed, became so great, and their depredations so serious, especially in garrotte robberies, that a cry of indignation, led by general alarm, was raised against the system which exposed society to such dangers. There was a vague desire to return to transportation—to rid the country once more, by removal to far-off points, of the criminals who preyed upon it. The usual panacea for all public grievances was presently tried, and the system with which Sir Joshua Jebb's name had come to be identified was arraigned before a select committee of the House of Commons in 1863.

Before reviewing the report of this committee, it will be well to retrace our steps and examine the phases through which prison discipline had passed since 1836. We left this, which embraces the preliminary stages of secondary punishment, at a date when public attention was very generally drawn to it. The true object of penal treatment had begun to be understood, and keen controversy had arisen as to the best methods for securing it. This object broadly stated, was to compass the reformation of the convicted offender and at the same time deter others from crime. The chief experiments in this direction had been made in the United States, where two remarkable systems of penal discipline had for some time been in operation. Each had its warm supporters and friends. One had originated with the Quakers of Pennsylvania, who, as

far back as 1786, had abolished capital punishment and all other purely personal penalties, and had subjected all offenders instead to solitary confinement without occupation for mind or body.¹ This, as developed in the years following, became the purely solitary system, and was the first of the two methods mentioned above. The idea, although not absolutely new, having been already accepted in the United Kingdom both in the Gloucester penitentiary and the Glasgow bridewell, was hailed with enthusiasm as a solution of all difficulties of prison treatment. Many other States in the Union followed the lead of Pennsylvania. That of New York built the great Auburn penitentiary in 1816 to carry out the new principles. There every prisoner was kept continuously in complete isolation. He saw no one, spoke to no one, and did no work. But within a short period very deplorable results began to show themselves at Auburn. Many prisoners became insane; health was impaired, and life greatly endangered. Mr. Crawford, whose mission to the United States has been already referred to, was in favor of solitary confinement, but he could not deny that several cases of suicide followed this isolation. Some relaxation of the disastrous severity seemed desirable, and out of this grew the second great system, which was presently introduced at Auburn, and afterwards at the no less renowned prison of Sing Sing. It was called the silent system. While the prisoners were still separated at night or meals, they were suffered to labor in association, but under a rule of silence ruthlessly and rigorously maintained. The latter, entrusted to irresponsible subordinates, degenerated into a despotism which brought the system into great discredit. All discipline officers were permitted to wield the whip summarily and without the slightest check. "The quantity of punishment," says Mr. Crawford, "is entirely dependent on the will of the overseers, against whose acts there is no appeal." Under such a system the most frightful excesses were possible, and many cases of brutal cruelty were laid bare. Reviewing the merits and demerits of each system, Mr. Crawford gave in his adhesion to that of unvarying solitude as pursued in the Eastern Penitentiary in Pennsylvania. "I have no hesitation in declaring my conviction," he says, "that its discipline is a safe and efficacious mode of prison management"; of the opposite system, that of Auburn, he reports that, notwithstanding the order and regularity with which its discipline was enforced, "its effects were greatly overrated."

Mr. Crawford came back from the United States an ardent champion of the solitary system. To use his own words, "so greatly does increasing experience prove the importance of solitude in the management of prisons that I could not, if circumstances admitted, too strongly advocate its application in Great Britain, for every class of offenders as well as for persons before trial, under modifications which would divest seclusion of its harshest character." He saw great difficulties in making this the universal rule, chief among which was the enormous expense of providing suitable prisons. Some modification of the rule of unbroken solitude would be inevitable; but he strongly urged its adoption for certain classes, and he was equally convinced of the imperative necessity for giving every prisoner a separate sleeping cell. It is clear that the Government endorsed Mr. Crawford's views. Where it was possible they gave effect to them at once. At Millbank, with its spacious solitary cells, the rule of seclusion was more and more strictly enforced under the supervision of a reverend governor, also a warm partisan of the system. Ere long permissive legislation strove to disseminate the new principles. In 1830

¹ [By the Act of 1786 "the code was ameliorated by the punishment at hard labor, instead of death, for robbery, burglary, and the 'crime against nature.'" But capital punishment for murder has never been abolished in Pennsylvania, and solitary confinement has been accompanied by labor in the cell, reading and instruction. See *Sketch of Eastern Penitentiary of Pennsylvania*, by Richd. Vaux, Phila., 1872.—AM. ED.]

Lord John Russell had given it as his opinion that cellular separation was desirable in all prisons. But it was not until 1839 that an act was passed which laid it down that individuals might be confined separately and apart in single cells. Even now the executive did not insist upon the construction of prisons on a new plan. It only set a good example by undertaking the erection of one which should serve as a model for the whole country. In 1840 the first stone of Pentonville prison was laid; and, after three years of very considerable outlay, its cells, 520 in number, were occupied on the solitary, or more exactly the separate, system,—the latter being somewhat less rigorous and irksome in its restraints. To the credit of many local jurisdictions, they speedily followed the lead of the central authority. Within half a dozen years no less than fifty-four new prisons were built on the Pentonville plan, which now began to serve generally as a "model" for imitation, not in England alone, but all over the world. That able administrator, Sir Joshua Jebb, who presided over its erection, may fairly claim indeed to be the author and originator of modern prison architecture.

Other jurisdictions were less prompt to recognize their responsibilities, the city of London among the number. They were satisfied with small makeshifts and modifications, without entering upon that complete and radical reconstruction which could alone meet the case. From this inertness there followed a lamentable want of uniformity in the administration of legal penalties. Criminals suffered more or less punishment according to the locality in which they were incarcerated. Dietaries differed—here too high, there too low. The amount of exercise allowed varied greatly; there was no universal rule as to employment. In some prisons hard labor was insisted upon, and embraced treadwheels or the newly invented cranks: in others it was industrial, devoted to manufactures; while in some it did not exist at all. The cells inhabited by prisoners (and separate cellular confinement was now very general) were of different dimensions,—variously lighted, warmed and ventilated. The time spent in these cells was not invariably the same, and as yet no authoritative decision had been made between the solitary and silent systems. The first-named had been tried at Pentonville, but the period for which it was deemed possible had been greatly reduced. The duration had been at first fixed at eighteen months, but it was incontestably proved that the prisoners' minds had become enfeebled by this long isolation, and the period was limited to nine months. In many jurisdictions, however, the silent system, or that of associated labor in silence, was still preferred; and there might be prisons within a short distance of each other at which two entirely different systems of discipline were in force. In 1849 Mr. Charles Pearson, M.P., moved for a select committee to report upon the best means of securing some uniform system which should be at once punitive, reformatory, and self-supporting. He urged that all existing plans were inefficacious, and he advocated a new scheme by which the labor of all prisoners should be applied to agriculture in district prisons. The result of a full inquiry was the reiteration of views already accepted in theory, but not yet generally adopted in practice. The committee recommended separation, so long as it was conducted under proper safeguards; it animadverted upon the great variety which still existed in prison discipline and the construction of jails and strongly urged the legislature to entrust full powers to some central authority who would exact adherence to the rules laid down. Thirteen more years elapsed and still no such steps had been taken. A new committee sat in 1863, and in its report again remarked, and in no measured terms, upon the many and wide differences that still existed in the jails of Great Britain as regards construction, diet, labor, and general discipline, "leading to an in-

equality, uncertainty, and inefficiency of punishment productive of the most prejudicial results." Even yet separation was not universal; labor, dietaries, education—everything varied still. Matters could only be mended by the exercise of legislative authority, and this came in the Prison Act of 1865, an Act which consolidated all previous statutes on the subject of prison discipline, many of its provisions being still in force. It promulgated minute and precise regulations on every item of prison management, and backed them up with pains and penalties that ought to have ensured attention. Yet the years passed and uniformity was still far from secured; it was impossible, indeed, while prison administration was still left to a number of local authorities, no two of which were often of the same mind. Great varieties of practice still obtained. The number of feet ascended at hard labor on the treadmill differed in different districts; each jurisdiction still pleased itself as to dietaries; and it was still, as of old, a mere accident of locality whether imprisonment was light or heavy. The legislature had tried its best, but its best had failed. It had exercised some supervision through its inspectors, had forbidden cells to be used until duly certified as fit, had threatened to withhold exchequer contributions from prisons of which unfavorable reports were received. Such penalties had exercised no sufficient terrors. It began to be understood, moreover, that the prisons under local jurisdictions were not always conveniently and economically situated. In one district there might be too many, in another not enough; one prison was empty and its neighbor full to overflowing; yet there was no power to make transfers and equalize accommodation. All this produced excessive, even wasteful expenditure. Nor was its incidence, under altered conditions, exactly fair. Crime, with the many facilities offered for rapid locomotion to those who committed it, had ceased to be merely local, and the whole state rather than individual communities ought to be taxed; prison charges should be borne by the exchequer, and not by local rates. These considerations gained strength, and led at length to the introduction of the Prison Bill which became law in 1877, and which is the last Act passed for the regulation of prisons. By the Act of 1877 the control of all jails was vested in a body of prison commissioners appointed by, and responsible to, the home secretary. These commissioners had power to consolidate by closing superfluous prisons, to establish one system of discipline, and generally by watchful supervision, aided by the experience of specialists, to maintain that much desired uniformity which had been so long and unsuccessfully sought. At the same time the co-operation of the local magistrates was invited so far as advice and assistance were concerned; but all real power and control had passed from their hands into that of the commissioners of prisons. The system established by the Act of 1877 is that now in force, and we shall recur to it directly, in recapitulating the whole of our present method of secondary punishment.

Meanwhile considerable changes had been introduced into penal servitude, the punishment reserved for the gravest offences. We left this branch of the subject at a date (1863) when its efficiency was about to be tested by a parliamentary inquiry. The verdict given was in the main satisfactory; but doubts were expressed as to the severity of the discipline inflicted, the principal features of which were moderate labor, ample diet, and substantial gratuities. The first was far less than the work free men did for a livelihood, the second larger, the third excessive, so that convicts often left prison with thirty, forty, even eighty pounds in their pockets. Penal servitude, to use the words of the lord chief justice, Sir Alexander Cockburn, one of the members of the committee, "was hardly calculated to produce on the mind of the criminal that salutary dread of the recurrence of the punishment which may be the means of deterring him, and through his exam-

ple others, from the commission of crime." The chief recommendations put forward to mend the system comprised lengthening of all sentences, a diminution in the dietaries, the abolition of large gratuities, and, speaking broadly, a general tightening of the reins. The most notable change, however, was in regard to labor, the quantity and value of which was to be regulated in future by the so-called "mark system." This plan had originated with Captain Maconochie, at one time superintendent in Norfolk Island, who had recommended that the punishment inflicted upon criminals should be measured, not by time, but by the amount of labor actually performed. In support of his theory he devised an ingenious system of recording the convicts' daily industry by marks, which on reaching a given total would entitle them to their release. The mark system had already been tried with good results in Ireland, where the Irish system, as it was called, introduced by Sir Walter Crofton had attracted widespread attention from the extraordinary success which seemed to follow it. There had been a very marked diminution in crime, attributable it was supposed to the system, which was in almost all respects the same as the English, although the Irish authorities had invented an "intermediate stage" in which convicts worked in a state of semi-freedom, and thus practiced the self-reliance which in many superinduced reform. As a matter of fact the diminution in crime was traceable to general causes, such as a general exodus by emigration, the introduction of a poor law, and an increase in the facilities for earning an honest livelihood. It may be added here that, judged by later experience, the Irish system has evinced no transcendent merits, and it is now (1885) moribund. But we owe something to the Irish practice which first popularized the idea of maintaining a strict supervision over convicts in a state of conditional release, and it reconciled us to a system which was long wrongfully stigmatized as espionage. The mark system, as recommended by the committee of 1863, and as subsequently introduced, had, however, little in common with either Maconochie's or the Irish plan. It was similar in principle, and that was all. According to the committee every convict should have it in his power to earn a remission—in other words, to shorten his sentence by his industry. This industry was to be measured by marks, earned by hard labor at the public works, after a short probational term of close "separate" confinement. But the remission gained did not mean absolute release. All males were to be sent, during the latter part of their sentences, "without disguise to a thinly peopled colony," to work out their time and their own rehabilitation. The committee, it will be seen, still clung to the old theory of transportation, and this in spite of the lively protests of some of its members. The one outlet remaining, however, that of Western Australia, was soon afterwards (1867) closed to convict emigrants; and this part of the committee's recommendations became a dead letter. Not so the mark system, or the plan of earning remission by steady industry. This was carried out on a broad and intelligent basis by officials prompt to avail themselves of the advantages it offered; a readiness to move with the times, to adopt suggestions tending towards improvement, and generally to benefit by external advice and experience, has always characterized convict prison administration in recent years. Remedies have been at once applied where flaws were found. Thus in 1877-78 efforts were made to minimize contamination by segregating the worst criminals, and restricting conversation at exercise. Again, the recommendation of the latest commission of inquiry, that of 1878-79, tending in the same direction was immediately adopted, and a special class was formed in 1880 in which all convicts "not versed in crime," first offenders or at least comparatively innocent men, are now kept apart from the older and more hardened criminals. While these concessions have been cheerfully made, the stern

necessities of a penal system have been rigorously maintained. The committee last quoted gave it as their opinion that "penal servitude as at present administered is on the whole satisfactory; it is effective as a punishment and free from serious abuses; . . . a sentence of penal servitude is now generally an object of dread to the criminal population." This change is ascribed to the various improvements introduced—"longer sentences, spare diet, and generally a more strict enforcement of work and discipline."

Having thus traced the history of secondary punishments and prison discipline in England from the earliest times to the present day, it will be well to describe briefly the system of penal repression as now actually in force. This will best be effected by following those who break the law through all stages from that of arrest, through conviction, to release, conditional or complete. After a short detention in a police cell—places of duration which still need improvement—an offender, unless disposed of summarily, passes into one of Her Majesty's local prisons, there to await his trial at sessions or assizes. The period thus spent in the provinces will never exceed three months; in London, with the frequent sittings at Clerkenwell and of the Central Criminal Court, it is seldom more than one month. While awaiting trial the prisoner may wear his own clothes, provide his own food, see and communicate with his friends and legal adviser, so as to prepare fully for his defence. His fate after conviction depends on his sentence. If this be imprisonment, so called to distinguish it from penal servitude, although both mean deprivation of liberty and are closely akin, it is undergone in one of the "local" prisons—the prisons till 1878 under local jurisdiction, but now entirely controlled by the state through the home secretary and the commissioners of prisons. The régime undergone is cellular; able-bodied prisoners are kept in strict separation for at least one month, and during that time subjected to first-class hard labor, which is purely penal in character; and nowadays, under the uniform system introduced by the commissioners, consists of the treadmill, in which each individual ascends 8640 feet in a day's work, or six hours' work on cranks or hard labor machines is exacted where there are no treadwheels; and the labor whether of treadmill or crank, is generally utilized as the motive power for grinding corn or pumping water for prison use. Beating oakum with a heavy beater and mat-making with heavy implements are also considered first-class hard labor. A system of progressive stages not unlike the mark system has been adopted in the local prisons, and the prisoner's progress through each depends on his own industry and good conduct. During the first month he sleeps on a plank bed, a wooden frame raised from the floor, with bedding but without mattress. When he has earned the proper number of marks, which at the earliest cannot be until one month has elapsed, he passes into the second stage, and is allowed better diet, and a mattress twice a week. The third stage, at the end of the third month, gives him further privileges as regards diet and bed. The fourth stage concedes to the prisoner a mattress every night, and the privilege, if well conducted, to communicate by letter or through visits with his friends outside. These stages are applicable to females except as regards the plank bed; while youths under sixteen and old men above sixty are also allowed mattresses. A small gratuity may be earned during the second and three following stages, amounting in the aggregate to ten shillings [\$2.43]. The labor, too, may be industrial, and include instruction in tailoring, shoemaking, basket-making, book-binding, printing and many more handicrafts. Throughout the sentence the prisoner has the advantage of religious and moral instruction; he attends divine service regularly and according to his creed, is visited by the chaplain, and receives educational assistance according to his needs. His physical welfare

is watched over by competent medical men; close attention is paid to the sanitary condition of prisons; strict rules govern the size of the cells, with their lighting, warming, and ventilation. Dietaries are everywhere the same; they are calculated with great nicety according to the terms of duration, and afford variety and ample nutrition without running into excess. In a word, as regards discipline, labor, treatment, exactly the same system obtains throughout the United Kingdom from Bodmin to the far north, from Cork to Belfast.

Where the sentence passes beyond two years it ceases to be styled imprisonment and becomes penal servitude, which may be inflicted for any period from five years to life. The prisoner becomes a convict, and undergoes his penalty in one or more of the convict prisons. These are entirely under state management. A sentence of penal servitude, as now administered, consists of three distinct periods or stages: (1) that of probation endured in separate confinement at a so-called "close" prison; (2) a period of labor in association at a public works prison; and (3) conditional release for the unexpired portion of the sentence upon license or ticket-of-leave. (1) In the first stage, which is limited to nine months for reasons already given, the convict passes his whole time in his cell apart from other prisoners, engaged at some industrial employment. He exercises and goes to chapel daily in the society of others, but holds no communication with them; his only intercourse with his fellow creatures is when he is visited by the governor, chaplain, schoolmaster, or trade instructor. This period of almost unbroken solitude, when the mind, thrown in on itself, is supposed to be peculiarly open to lessons of admonition and warning, is one of severely penal character, and its duration has therefore been wisely limited. It is deemed, moreover, that perpetual seclusion in a cell is an artificial state of existence, that its infliction for long terms would altogether unfit an offender for a return to the ordinary conditions of daily life. (2) The second is a longer stage, and endures for the whole or a greater part of the remainder of the sentence—its duration being governed by the power a convict holds in his own hands to earn a remission. It is passed at a public works prison,—either at Borstal, Chatham, Chattenden, Portsmouth, Portland, Dartmoor, or (for the present) Wormwood Scrubs. While cellular separation, except at work, at prayers, or exercise, is strictly maintained, labor is in association under the close and constant supervision of officials. Intercommunication no doubt takes place; men working together in quarry, brickfield, or barrow-run, and out of earshot of their guardians, may and do converse at times. But the work is too arduous to allow of long and desultory conversation; while the chance of mutual contamination is now minimized by the separation of the less hardened from the old offenders in the manner already pointed out. There is no reason to suppose that any great evils result from this association, and without it the execution of the many important national public works which now attest its value would have been impossible. Among these may be mentioned the following: the quarrying of stone for the great Portland breakwater, which is nearly two miles in length, and between 50 and 60 feet deep in the sea, with the defensive works on the Verne, batteries, casemates, and barracks intended to render the island of Portland impregnable, and the enlargement and extension of the dockyards at Chatham and Portsmouth; at the former three grand basins 20, 21, and 28 acres respectively in extent have been completed on the marshy lands and reaches of the Medway, and at the latter extensive operations of the same kind have long been in progress. At Borstal a line of forts intended to protect Chatham on the southern and western side are being erected by convicts; they are also building magazines at Chattenden on the left bank of the Medway; they will soon be at work at Dover on the vast improvements for the

enlargement of the harbor and port. Besides this, convict labor has been usefully employed in the erection of prison buildings at new points or in extension of those at the old; at Borstal cells for five hundred, and at Wormwood Scrubs for ten hundred and fifty-two have been built, with chapel, quarters, hospitals, and so forth; large additions have been made to the prisons of Woking, Pentonville, Chatham, Portsmouth, Dartmoor, Parkhurst, and Brixton. In all cases the bricks have been made, the stone quarried and dressed, the timber sawn, the iron cast, forged, and wrought by the prisoners; only one article was bought ready made, and that was the locks. The great merit of this system is the skill acquired in handicrafts by so many otherwise idle and useless hands. Convict mechanics are rarely found ready made. A return dated July, 1882, shows that 82 per cent. of the total number employed at trades had learnt them in prison. These results are no doubt greatly aided by the judicious stimulus given to the highest effort by the mark system. The chief objection to enforced labor has been the difficulty in ensuring this; but the convict nowadays eagerly tries his best, because only thus can he win privileges while in prison and an earlier release from it. Every day's work is gauged, and marks recorded according to its value; upon the total earned depend his passage through the stages or classes which regulate his diet and general treatment, and more especially his interviews and communications with his relations and friends. Yet more; steady willing labor continuously performed will earn a remission of a fourth of the sentence, less the time spent in separate confinement. It must be borne in mind that the marks thus earned may be forfeited at any time by misconduct; but only to this extent does conduct affect remission, and the latter is really directly dependent upon industry. The full remission in a five years' sentence is one year and twenty-three days; in seven years, one year two hundred and seventy-three days; in fourteen, three years one hundred and eighty-one days; in twenty, four years eighty-six days. "Lifers" cannot claim any remission, but their cases are brought forward at the end of twenty years, and then considered on their merits. (3) Having earned his remission, the convict enters upon the third stage of his punishment. He is released, but only conditionally, on license or ticket-of-leave. This permission to be at large may easily be forfeited. Stringent conditions are endorsed upon the license, and well known to every license holder. He has to produce the license when called upon; he must not break the law, nor associate with notoriously bad characters, nor lead an idle dissolute life, without visible means of obtaining an honest livelihood. The observance of these rules is enforced by the police, to whom Acts known as the Prevention of Crimes Acts give large powers. The license holder is ordered to report himself at intervals to the police, to whom also he must notify any change in his place of residence; he must take care that he is not found in any suspicious locality under suspicious circumstances. A breach of the regulations may entail the forfeiture of the license, with imprisonment and the obligation to return to a convict prison to serve out the unexpired term of penal servitude. Police supervision by special sentence of a court may be extended in the case of habitual criminals to longer periods than that of the original sentence. An elaborate machinery also exists for the registration of these habitual criminals, and voluminous official records are regularly published and circulated giving detailed information, distinctive marks, and previous history, to enable the police in all parts of the country to identify habitual criminals. A system so rigorous towards offenders who have already expiated their crimes may be deemed to bear heavily on any who have repented of their evil ways and are anxious to turn over a new leaf. To be ever subjected to the intrusive watchfulness of the myrmidons of the law must often increase the license

holder's difficulty of leading an honest life. The struggle is often severe; employers of labor are not too ready to accept the services of "jail birds," and free workmen often resent the admission of an old convict amongst their number. Private charity has happily come forward to diminish or remove this hardship, and many societies have been called into existence for the special purpose of assisting discharged prisoners. The first of these, now honored with the title of "Royal," was organized in 1856, and had assisted, up to 1879, some eleven thousand prisoners. This society labors chiefly in the metropolis; it is supported by private subscriptions, but it has control also over the gratuities of the licensees who accept its aid. The prisoners on release are first examined at the society's office as to their prospects and wishes; they are given some pocket money out of their own gratuities; and their "liberty clothing," a present from the prison, is changed for more suitable clothes. They are then placed in respectable lodging-houses until in due course employment is obtained for them, after which the society undertakes the reporting to the police, and by its own agents exercises a watchful care over its protégés. There are now upwards of twenty societies established in various parts of the country, and the number is rapidly increasing.

The foregoing system is applicable more particularly to adult males; but for females the rules are much the same as regards imprisonment and penal servitude. But the remission a female convict can earn is greater, and amounts to a third of the sentence, less the separate confinement. Moreover, female convicts whose conduct and character warrant a hope of complete amendment are admitted into "refuges" nine months before the date of their conditional release on leave. There are two of these refuges, which are more like "homes" than prisons,—the Westminster Memorial Refuge at Streatham for Protestants, and the East End House, Finchley, for Roman Catholics. The training of these refuges is calculated to fit the licensee for more complete freedom, and many of the women who go from them into the world do well. The aid societies also help effectually in obtaining situations, often very good ones, for the released female convicts.

Juvenile criminals are now subjected to special treatment. Young offenders, although liable to be treated as adults by the court before which they are brought, are generally dealt with summarily under various powers, exercised, in some cases in England and Ireland, with the consent of the accused, or, in the case of a child, of the parent or guardian. The discretionary powers of summary courts are wide, ranging in many cases from dismissal (although the charge is proved) to payment of damages and costs, or fine, or limited imprisonment, and in the case of a male child with private whipping either in addition to or instead of any other punishment; and whipping in addition to other punishment may be imposed by all courts on the trial of male offenders under sixteen for the majority of offences. For the very important power of relegating juvenile offenders to reformatory schools and vagrant and neglected children to industrial schools see the separate article, REFORMATORY AND INDUSTRIAL SCHOOLS (*q.v.*).

Juvenile offenders and children while detained in reformatory or industrial schools are not subject to prison discipline, but the rules for the management and discipline of the schools and the detention in them may be enforced by imprisonment. Very beneficial results as regards the diminution of crimes are undoubtedly obtained by various institutions, both public and private. The possible criminal is removed from evil associations while still amenable to better influences; and while still malleable he is taught to labor honestly with his hands. Prison statistics, more especially of the convict prisons, show a marked decrease in the number of youthful offenders in duration, and it is reasonable to suppose that from the

causes above mentioned there is a gradual stoppage in the supply. In the ten years between 1871 and 1881 the number in custody of ages between fifteen to twenty-four fell from 2948 to 1957, and this although the general population had increased four millions. The same reduction has shown itself as regards the number of the same ages in local prisons; and it is clear that the improvement is general.

Uniformity in prison discipline is now general throughout the United Kingdom. The Prisons Act of 1877 also extended to Scotland and Ireland, and in both those countries the system of imprisonment for terms of two years and under has been assimilated to that in force in England. As regards penal servitude, convicts pass through the same stages or periods; but Scottish convicts, after undergoing their separate confinement in the general prison at Perth, have been drafted into the English public works prisons. Of late there has been a movement towards securing some of the advantages of convict labor for works north of the Tweed, and it is probable that harbor works will soon be undertaken at one or more points on the Scottish coast. For Ireland, the progressive periods are passed in that country—separate confinement in Mountjoy prison, public works at Spike Island. The administration of prisons has also been assimilated in Great Britain and Ireland, and has been centralized in each capital under the authority of the state. Boards of prison commissioners in London, Edinburgh and Dublin, and acting under the immediate orders of the executive, control all local prison affairs, including finance, victualling, clothing, the appointment of officers of all grades, and the discipline of prisoners. The English convicts are still managed by an independent board called the directors of convict prisons, but both commissioners and directors have the same chairman and chief, while the staff of clerks and accountants and storekeepers—in a word, the whole administrative machinery—is identical for both. The welfare of the inmates of all prisons is not, however, left entirely to the discretion of official managers. The local magistracy have still a certain jurisdiction in the local prisons; through elected representatives styled "visiting committees," they constantly inspect the prisons and exercise supervision over their inmates. They have retained their power to punish and generally deal with all cases of aggravated misconduct. The functions exercised by these visiting committees might seem to constitute a dual authority in prison management. But so far the two powers have worked harmoniously and well. Since 1880 unofficial and unpaid visitors have also been appointed to undertake an independent inspection of the convict prisons. This practice was introduced, not on account of any administrative failure in the system, but as a safeguard against possible abuses, and to strengthen public confidence. These visitors can give no orders, but they are empowered to make full inquiries into the state of the prisoners and the condition and discipline of the prison.

The sum voted in 1883-84 for convict establishments in England was £414,463 [\$2,014,290.18], but this includes £18,100 [\$87,966] for expenditure in colonies where a few imperial convicts still survive, and grants in aid of colonial magistrates, police and jails. The vote for local prisons in the same year was £481,852 [\$2,341,800.72]. The returns from male prisoners' labor in the convict prisons in 1883-84 amounted to £248,995, 11s. 3d. [\$1,210,118.43]. Of this total, £121,956, 5s. 2d. [\$592,707.42] represented the estimated value, by measurement, of labor on public works, and £42,159, 8s. 4d. [\$204,894.76] more the value of prison buildings erected, while the earnings in manufactures amounted to £37,581, 8s. 8d. [\$182,645.76]. The balance was the farm and the work performed for the prisons. The female convicts' labor amounted in the same year to £9,933, 9s. 5d. [\$48,276.67], half of which was in washing and manufactures. In the local prisons in England manufac-

tures brought in £39,790, 3s. 11d. [\$193,380.35]. The value of the labor on prison buildings was £24,510, 4s. 2d. [\$119,119.61], and that in the service of the prisons £59,562, 0s. 8d. [\$289,471.48]. The prison vote in Scotland for 1883-84 was £110,170 [\$335,426.20], the returns from earnings £6000 [\$29,160]; in Ireland the vote was £145,689 [\$708,048.54] and the earnings £4000 [\$19,440]. The above terms of expenditure include all outlay—staff (superior and subordinate) maintenance, travelling expenses, etc.

Most civilized nations have considered the question of prison discipline from time to time, and have endeavored, but with varying degrees of earnestness, to conform to accepted modern ideas as to the proper method of dealing with criminals. The subject has also been dealt with at two international congresses, one of which assembled in London in 1872, and the other at Stockholm in 1878, when views were exchanged and matters of much interest discussed. It is proposed now to supplement the foregoing account of British prison discipline by a brief survey of the prison systems in force in the British dependencies and in various other countries.

British Colonies and India.—The prison systems of most of the British colonies have been assimilated as far as possible to that in force in the mother country. In all the larger colonies there are convict prisons and local prisons, and in all cellular separation for the whole or part of the sentence is the rule. This is the case in the Australian colonies, in Tasmania and in New Zealand.

The prison system of Canada is advanced and enlightened. The numbers incarcerated are not great, and crime is not very prevalent. Six establishments suffice for the Dominion—Kingston, St. Vincent de Paul (for the province of Quebec), Halifax, Manitoba, British Columbia and Dorchester. The last-named has replaced that at St. John's. All these are cellular prisons; and they receive prisoners of all categories, for trial and after sentence whatever the term. Females have a special quarter in each prison. Isolation is strictly carried out for all short sentences; but for the longer labor is in association. A great deal of good work is turned out in the Canadian prisons. All the rolling stock for railways in Government hands, iron-work, clothing and boots and shoes are produced at the various prisons, but not to an extent to allow all prisoners to be instructed in trades. Most of the prisons possess land in their vicinity which is tilled by the prisoners. There are no prisoners' aid societies as yet in Canada, although their formation has been earnestly recommended.

For the Cape of Good Hope there is a good prison at Cape Town. In Ceylon, since 1867, cellular separation has been enforced for the whole period of short sentences, and the first six months of long sentences. In Jamaica there are several kinds of prisons, but only the principal, the general penitentiary, has any number of separate sleeping cells.

In India the jails number upwards of 230, with an indefinite number of small lock-ups. There is also the large convict depot at Port Blair in the Andaman Islands. Very few of the Indian jails are entirely cellular; two in particular may be mentioned, that of Utakamand and that of Hazaribagh, both of which are for European convicts. "The remainder," says Dr. Mouatt, formerly inspector general of prisons in Bengal, "are built on every conceivable plan; a large number of them are miserable mud structures, which are constantly being washed away by heavy rain, and as constantly provide work for the prisoners in repairing them." A few of them are radiating, and nearly all provide for the separation by night of the male and female prisoners; and there is a certain rough classification according to sentence. All work is in association, except when prisoners are kept in cells for misconduct. The proportion of cell accommodation, when Dr. Mouatt wrote, was barely 10 per cent. Work is mostly intramural, and generally remunerative and industrial. Prisoners are occasionally employed out of doors in gangs upon canals and other public works. The ironing of prisoners where prisons are insecure still prevails as a safeguard against escape. Prison punishments are generally severe, and include flogging, fetters, penal labor, and complete isolation. The whole question of prison discipline in India is strictly subordinated to financial considerations, and the system in consequence lacks uniformity and completeness.

Austria.—It was not until 1867 that the Austrian Government declared in favor of a system of cellular imprisonment. Till then all prisoners had been kept in association, but at the date above mentioned a recommendation that separation should be the rule was made to the Reichsrath and approved. Owing to the expense of reconstructing or

converting prisons, the principle could not be generally adopted; moreover, the Austrian authorities were not in favor of continuous isolation. Hence the practice adopted was a combination of the two methods. Short imprisonments might be endured entirely in separate cells; every prisoner might pass the first part of a long term in a cell, but the isolation was not to exceed eight months, the remainder of the sentence to be undergone in association or collectively, due regard being had to the classification of the prisoners brought together. This classification is based upon the individual's age, education, state of mind, and former life, and the nature of his crime. The progress made in the erection of cellular prisons has not been very rapid. Although the total number of prisoners in Austria-Hungary exceeds 17,000, up to the end of 1879 only 1050 cells had been provided, viz., at Gratz 252, at Stein 348, at Pilsen 387, and at Karthaus 63, while two small prisons for trial prisoners have also been built at Cilli and Reichenberg. These new prisons are, however, very complete and perfect; they have all modern appliances, chapels, hospitals, workshops, and baths; the cells are spacious, and well ventilated, lighted, and warmed. Two days of cellular imprisonment, after three months have elapsed, count as three in association. There is no distinctly penal labor. In separation prisoners follow such trades as shoemaking, tailoring, weaving, button-making, wood-carving; women are employed in embroidery, spinning, quill-pen making, and knitting. In association the principal employments are carpentering, coopering, smith's work, brick-making; and a number of the more trustworthy prisoners have helped to construct railways and lay down roads. As a rule the prisoners' labor is let out to contractors; this plan is preferred as relieving the state of all risks, while officials are more at liberty to attend to the pure disciplinary treatment of the prisoners. As a rule every prisoner who enters ignorant of a trade is taught one in prison. Prisoners can earn substantial wages; where contractors are employed, the prisoners receive half what is paid over, after all costs have been deducted. Half of the earnings may be spent in the prison canteen in the purchase of luxuries, including beer and tobacco, or in the support of a prisoner's family, or in the purchase of clothing to be worn on discharge. There is only one "Liberated Prisoner Aid Society," which is established at Vienna, and which does good service in supporting prisoners until they find occupation, and providing them with money, clothes and tools. Speaking generally, there are three classes of prisons in Austria-Hungary, viz., for minor offences, and for prisoners sentenced to terms less than one year and to terms of one year and upwards respectively. The treatment of the incarcerated is humane: their diet is sufficient; they have good beds and bedding; the sick are cared for in hospitals; the labor of the able-bodied is not excessive, although supposed to extend over ten hours daily. Religious services are provided for, and non-Roman-Catholic prisoners may be seen by ministers of their own form of faith. Prison administration is under the minister of justice, who delegates his powers to an inspector general of prisons. Commissions of inspection are appointed to visit all the cellular prisons monthly, and there are also local boards of management and control.

Belgium.—Prison discipline has perhaps received as close attention in Belgium as anywhere in the world. In 1835, when the great movement towards prison reform was in progress, Belgium first adopted the cellular system experimentally by constructing thirty-two cells in connection with the old prison at Ghent. After a trial of nine years a verdict was passed in favor of cellular separation and it was authoritatively adopted in 1844. Progress was steady if not rapid; by degrees many cellular prisons were built; and up to the present date (1885) twenty-four are in existence. A model prison for 600 on the same plan is in process of construction at Brussels, and three others, smaller, will soon be finished. Belgium has unhesitatingly accepted the rule of absolute separation as regards all prisoners, whatever the duration of their sentences. That solitude which disastrous results in England have strictly limited to either nine months, or, under certain modifications, to two years, may be enforced in Belgian prisons for at least ten years. At the end of that period a prisoner may claim to go into association, and they are then removed to Ghent, where they work and eat in company but have separate sleeping cells. Separation, again, is not insisted upon with the sickly, or those whose minds appear weak; while all upon whom cellular imprisonment has failed may also in due course be removed to association. But for the rest the separate system is the invariable rule, and it is carried out with careful and unvarying sternness. The prisoner never leaves his cell save for chapel or exercise; at the former he is in a separate box or compartment; the latter he takes alone in a narrow yard. His life, however, is not one of

absolute solitude. He is visited frequently by his warders and schoolmasters and trade instructors; chaplain, governor, and doctor also break the monotony of his life. According to the Belgian view of the case, he "lives in association with the prison staff," not with his fellow criminals. It is claimed for this system, which aims primarily at the reformation of individuals, that no evil consequences have as yet been seen to follow from the treatment. Official statistics may be searched in vain for the record of cases of suicide or of mental alienation; neither are abnormally frequent. On the other hand the Belgian authorities insist that the dread of the punishment has had a marked effect upon crime, and that there is a diminution in the number of second sentences. "Recidivists," or reconvicted prisoners, are, moreover, subjected to a more rigorous discipline.

There are three classes of prisons in Belgium;—the *maisons d'arrêt*, or prisons of detention, for accused persons undergoing examination or awaiting trial; the *maisons de sûreté*, or prisons for the infliction of short sentences; and the *maison centrales*, which correspond to the English convict prisons. Prisoners awaiting trial, and still innocent in the eyes of the law, are treated with much leniency and consideration. An arrangement peculiar to the French and Belgian prisons is the privilege of the "pistole." A prisoner on payment of a certain charge is conceded better accommodation; he has a room, not a cell, decently furnished, and may provide his own food, have books, see his friends, and do no work. Offenders of the better class, and never previously convicted, are sometimes relegated specially to the pistole by the tribunals; and the local boards of visitors have also power to transfer prisoners to this privileged class. Independent of the pistole the law provides three kinds of penalty—correctional imprisonment, seclusion, and imprisonment with hard labor. But, except the slight differences as regards privileges of letters and visits, the treatment is identical in all three categories. It is correctional for all; all prisoners are kept in seclusion; and there is no hard labor, as we understand it. Purely penal labor does not exist in the Belgian prisons. Public works are obviously impossible; and there are no tread-mills or cranks. The labor is entirely industrial; but its object is rather to reform individuals than to produce profit to the state. With strict cellular confinement the range of prison industries is generally limited to sedentary employment; but, besides, weaving, tailoring, shoemaking, book-binding, and so forth, various handicrafts are practiced. The prisoner's labor is partly let out to contractors, partly utilized by the authorities. A portion of the earnings for work done goes to the prisoners; and part of the money may be spent in the purchase of better food or tobacco, where it is permitted, from the canteen. No pains are spared to instruct the prisoners; those ignorant of any trade are regularly apprenticed and taught, the idea being to provide every one with a means of livelihood on release. The severity, not to say cruelty, of the strict rule of separation is mitigated as far as possible by the paternal solicitude of the authorities. The administrative arrangements of the Belgian prisons are nearly perfect. The buildings are spacious—the halls lofty, light, and airy; the cells are of ample dimensions, carefully ventilated, well-lighted, and well-warmed. An abundant water supply assists the sanitary services; dietaries are sufficient and well-chosen, soup with plenty of vegetables forming an especial feature in them. School instruction is available for all. There are well-supplied libraries. The hospitals are clean and spacious, fitted with every necessary, and the percentage of patients under treatment is usually small. An epidemic of ophthalmia was, however long present in the reformatory prison of St. Hubert. An independent system of visitation is supposed to protect the prisoners from ill usage; local boards composed of local functionaries exercise constant supervision and control over the prisons in their vicinity. The central administration is intelligent; and the prison service being esteemed highly honorable attracts good men to recruit its ranks. Female prisons are exclusively managed by the nuns of some religious order in the locality. Besides the prisons of punishment for adults, there are two establishments in Belgium which deal exclusively with juvenile crime. These are at St. Hubert in Luxemburg, and at Namur. The first dating from 1840, is an agricultural colony which receives all youths up to the age of fourteen; the labor is exclusively in the fields. Young criminals belonging to the towns are sent to Namur, where the work is mechanical but more sedentary. A good education both moral and practical is received at these reformatories, which are more like schools than prisons. There are also philanthropic schools for vagrants and non-criminal children. At present no societies labor to assist prisoners on release. A complete organization once existed for the purpose, but it was wholly official, and those whom it was supposed to

benefit suspected and kept aloof from it. It may be added that, although there is no power in the prisoners' own hands of working out remission by steady industry and good conduct, sentences may be abbreviated on these grounds on the recommendation of the prison authorities. All sentences, too, have been shortened since the general introduction of cellular imprisonment; as the treatment was more severe, justice demanded a curtailment of the penalties. Capital punishment, although not definitely abolished, is never inflicted, and all sentenced to death pass into prison for life. But after ten years they too are transferred to Ghent for the remainder of their days.

Brazil.—The present emperor of Brazil has long taken an active interest in prison reform. He has encouraged the prison administration of his country to introduce a scheme which is in many respects the same as that in force in England. Prisoners, after sentence, are subjected to a period of close cellular confinement enduring eight months; they then pass to another prison, where cellular separation is still enforced, but the daily labor is in association and in silence. This is styled the reformatory stage; after that comes the third stage, which is reached by marks gained through industry and good conduct. In this last stage, called the testing stage, prisoners work together; they may converse, may wear their own clothes, and are under the care and supervision of the most trustworthy of their fellows. They sleep in large dormitories, not in cells, are allowed to cultivate a piece of garden ground on their own account, and a large portion of their earnings is placed to their credit and handed over to them on release.

Denmark.—The prison system in force in Denmark dates from 1840, previous to which time the arrangements were extremely unsatisfactory. In the early part of the century Danish prisons were in as deplorable condition as any in Europe; after enduring indescribable horrors, the worst malefactors passed on to hard labor in the fortresses or in the fleets. But a commission was appointed in 1840 to report, and recommended the adoption of the cellular system for all prisoners awaiting trial, and under short term sentences—those condemned to long imprisonment to be put to hard labor in association. The necessary prisons were constructed at a cost, within a quarter of a century, of two millions of pounds. There are a large number of small detention prisons, and four principal prisons for the convicted; one cellular for males at Vridsløseville, and two associated at Horsens and Viborg, one for females combined cellular and associated at Christianshavn. About 75 per cent. of the whole are sentenced to separative confinement in cells; its infliction is limited to first offenders, youths, or those sentenced to six months and upwards to three years and a half; the associated or aggregate system applies to the reconvicted, and for terms from two years to life. There is no distinctly penal labor in the prisons; the industrial prevails, and is in the hands of contractors. Prisoners in cells are constantly visited; religious and secular instruction is imparted; the dietaries are carefully calculated and the régime generally intelligent and humane.

A number of aid societies have been established at the seat of the large prisons, which assist prisoners on release who have been diligent and well conducted in confinement. Work is found, tools and subsistence given, as in England. It is interesting to note that the first aid society was formed at Copenhagen in 1841, through the exertions of Mrs. Fry. Besides the regular prisons, there are three reformatories for juveniles modelled on the French school at Mettray; they have been founded by private benevolence, but receive aid from the state. Agriculture is the principal employment of the inmates.

France.—Prisons and their management have not attracted close or continuous attention in France. Dynastic changes, wars, revolutions, and intestinal troubles may be pleaded as the excuse. A system based on the principle of individual separation as practiced in the United States was on the point of being adopted in France when the legislation to secure it was interrupted by the revolution of 1848. Under the empire the question was generally subordinated to more pressing political needs. Cellular imprisonment was, however, adopted partially, but only to a limited extent, for persons awaiting trial. Central prisons in which the prisoners lived and worked in association had been established early in the century, and their use was extended. They received all sentenced to the shorter terms. The long-term convicts went to the *bagnes*, the great convict prisons at the arsenals of Rochefort, Brest, and Toulon; and in 1851, a few years after it had been abandoned by England transportation to penal colonies was adopted by France. In 1869 Napoleon III. appointed a commission to inquire and report upon the whole question, but its labors were rudely interrupted by the Franco-German War. Three years later a fresh commission, appointed by the national

assembly to discuss parliamentary reform made a most exhaustive report in 1874. It unhesitatingly recommended cellular confinement, and the principle became law the following year. This system of prison discipline then became applicable to all persons awaiting trial, to those sentenced to any term up to a year and a day, and to those for longer terms provided they asked to be kept separate and apart. It was calculated by the commission first mentioned that there were nearly eight thousand cells already in existence and available, but an additional twenty-one thousand would have to be constructed at an outlay of sixty-three millions of francs [\$11,466,000] in order to meet the demands of this new system. A model cell was designed and plans for model prisons, but the expense the change would entail appears to have deterred French authorities, both the central executive and the *conseils généraux*, from promptly making it. There are not more than ten or a dozen cellular prisons in France, and two of them are in Paris—Mazas (for trial prisoners) and La Santé, but the latter is not entirely cellular. The construction of others has been contemplated, but in few cases proceeded with, and many years will probably elapse before any uniformity in penal treatment is established in France.

Prison administration is complex in France, and there are many kinds of prisons—a few of them being under the authority of the minister of the interior: (1) the *maison d'arrêt*, temporary places of durance in every *arrondissement* for persons charged with offences, and those sentenced to more than a year's imprisonment who are awaiting transfer to a *maison centrale*; (2) the *maison de justice*, often part and parcel of the former, but only existing in the assize court towns for the safe custody of those tried or condemned at the assizes; (3) the *dépôt* situated on the island of Ré, for all sentenced to *travaux forcés* awaiting deportation to New Caledonia (Arabs so sentenced wait at Avignon their removal to French Guiana); (4) departmental prisons or houses of correction, for summary convictions, or those sentenced to less than a year, or, if provided with sufficient cells, those amenable to separate confinement; (5) the *maisons centrales*, or central prisons, for all sentenced to more than a year, or for men and women above sixty sentenced to *travaux forcés*; (6) *maison de force*, for women sentenced to *travaux forcés*, or both sexes condemned to seclusion; (7) prisons for those sentenced to simple detention; (8) penal settlements in Corsica, more particularly at Chiavari, Casabianca, and Castelluccio, the régime of which is the same as in the *maisons centrales*; (9) reformatory establishments for juvenile offenders; and (10) *dépôts de sûreté*, for prisoners, who are travelling, at places where there are no other prisons. The total number of prisons of all classes in France, exclusive of the last, exceeds 500, and the prison population averages 50,000 daily. Besides the foregoing there are a certain number of military prisons under the war minister seated at the great garrison towns, or in Algeria; and at all the seaports there are maritime prisons for soldiers or sailors who have broken laws civil or military. The latter are under the minister of marine, who also has special charge of the penal settlements at a distance from France, including French Guiana and New Caledonia, where there are several prisons and hulks adapted for the confinement of convicts. The disciplinary treatment of all prisoners in separate confinement is much the same in France as elsewhere; the isolation while it lasts is complete and is broken only by the frequent visits of officials. The exercise is solitary, and at chapel the same rule obtains by each prisoner occupying a separate box, or by having service in the centre of the prison, to which all the cell doors, slightly opened, converge. It may be stated here that religious tolerance prevails everywhere; and prisoners not Roman Catholics may receive the ministrations of clergymen of their own creed. Female prisons are mostly managed by nuns or members of the female religious orders. There is one at Doullens especially kept for Protestant female prisoners, and managed by a Protestant sisterhood. The evils of association in the congregate prisons are diminished by classification, so far as it goes. But prisoners are at least kept in categories; trial prisoners are together; those for a year are kept apart from the summary convictions, and convicts *en route* for the island of Ré from all the rest. Males and females occupy different prisons. As almost all prisons have at least a few separate cells, these are utilized either for the recidivists and those of worst character, or for any well-disposed prisoners who exhibit a real desire to amend. The diet, although coarse, is liberal. It may be supplemented by purchase made from the canteen, at which both wine and tobacco may be obtained by all who can pay for it. Each person may thus spend a certain proportion of his earnings or *pécule*, the rest being reserved for his discharge. What remains of the product of the prisoner's

labor is handed over to the contractor, who also receives a grant per prisoner from the state. Labor is only obligatory upon those so sentenced; it is purely industrial; penal labor, such as treadmill or crank, does not exist in French prisons. In the smaller it is not easy to find occupation for the inmates, but in the larger many and various industries are carried on. Among the more ordinary trades the manufacture of "articles de Paris," toys, neat bonbon boxes, hosiery, and cabinet-making produce good financial returns. The labor of the prisoners in Corsican settlements has been usefully directed upon the reclamation of marshy lands, the clearing of forests, and the tilling of the less fertile districts. The agricultural results have been good as regards the cultivation of the orange, olive, and vine; mulberry trees have been planted for the silk-worm; and the wheat fields have returned rich harvests of grain, much esteemed in Italy and the south of France. Good roads and many canals have been made, to open up the interior. These Corsican prisons have long suffered from the unhealthiness of their neighborhood but the draining of the marshes, the development of irrigation and the plantation of trees have all combined to improve their sanitary conditions.

The efforts made in France, more particularly by private benevolence, to cope with juvenile delinquency have been very praiseworthy. French reformatories are of two classes—those that are punitive or correctional, and those that are simply reformatory. To the first, where the discipline is severe, are sent all youths convicted of offences committed with full knowledge of their criminality, and those relegated from the reformatories as insubordinate; to the second, children proved guilty but not responsible for their acts, or the ill-conducted whose parents cannot manage them. The first-named are public institutions maintained by the state; the latter are private, and may be supported entirely by subscriptions. There are in all thirty-eight of the former, as well as five penal colonies, and five juvenile quarters attached to various departmental prisons; of the latter there are twenty-eight. All these are for males. For females there are twenty-three private establishments and one public. The most important of the public reformatories for boys is that of La Petite Roquette in Paris, immediately opposite the convict prison of the same name, in front of which executions are carried out. Of the private institutions that of Mettray near Tours, started by the benevolent enterprise of M. de Metz, has a world-wide reputation. A very successful female reformatory is that of Darnétal near Rouen, where the women are employed in farming and field operations.

As regards the most heinous offenders, France not only clings to deportation, but is disposed to enlarge and multiply her penal settlements. In 1884 the Government had under consideration the necessity for sending out all "recidivists" to the Polynesian islands. This, however, has been hindered for the moment by the energetic protest of the Australian colonies, and, instead of the number sent to New Caledonia being increased, French Guiana will probably be more largely utilized. In the former islands most of the evils which attended the early days of transportation to Australia have been apparent. The French convicts either remain in the hands of the Government incarcerated in badly constructed prisons, where discipline and supervision are unsatisfactory or incomplete, or they pass into a state of semi-freedom to work for free settlers on their own account. There are not enough of the latter to afford much employment, and the conditions of the soil of New Caledonia are not such as to encourage the convicts to work for themselves. It is extremely improbable that the penal settlement will ever grow into a prosperous self-supporting colony, and thus the chief end of deportation remains unachieved. At present the French penal settlements beyond sea are merely badly-built indifferently-managed prisons at a long distance from home.

Germany.—There is a similarity in the prison discipline of the various units of the German empire. In the grand-duchy of Baden there are four kinds of prisons—district prisons, fortresses, houses of correction, and central prisons. The punishment in the two first named is simply detention or privation of liberty,—the district prisons being for persons under examination and waiting trial, or those sentenced to less than six weeks' imprisonment. Sentences above that time are endured in the central prisons. The principle of cellular imprisonment is the general rule, but it is not extended, unless at a prisoner's wish, beyond three years. For youths between twelve and eighteen the limit is six months. Prisoners unfit for solitary confinement and those who have endured three years' detention are kept together, but they are not associated during working hours. Both systems are supposed to be attended with good results in Baden. Both have their merits, but popular feeling inclines most to the cellular plan as conducing to reform while

it keeps the prisoners from mutual contamination. The chief cellular prison is at Bruchsal, where there is accommodation for five hundred, but there are a certain number of separate cells attached to many other prisons. The labor in the prisons is industrial as opposed to penal; contractors are not encouraged; and in most prisons the administration itself keeps the employment of the prison in its own hands. Forty per cent. of the prisoners on admission are ignorant of any trade, but they do not leave prison without learning one. Prisoners' aid societies exist in twenty-nine out of fifty-nine districts, and they achieve good results, although their aid is not too frequently invoked.

The bulk of the prisons in *Bavaria*, mostly converted castles and convents, are on the collective system, but there are four cellular prisons—one at Nuremberg, and three other district prisons for those awaiting trial. The prisons are much the same as in Baden. There are police prisons for first arrests; district prisons mentioned above, which also take short sentences; prisons for three months' sentences and upwards, and for juveniles; and houses of correction. There are also special prisons set apart for persons convicted of theft, fraud, robbery, receiving, whose sentences exceed three months; and a system of classification exists which separates all likely by their previous character to exercise a baneful influence on their fellows. For the long-term prisoners the labor may be upon public works beyond the walls of the jail, and prisoners may demand to be so employed, or in work for which they are fit. Industry and good conduct will secure a remission of sentence. After three months of the sentence have been served there is no purely penal labor. Industrial labor is conducted by the prison authorities, who are not in favor of the employment of contractors, which is thought to jeopardize discipline. Secular education is not overlooked; there are hospitals, chapels, libraries, and the administration generally is humane. There are numerous societies to assist discharged prisoners, which, however, are said to be much hampered in action by the ignorance and prejudice of the public. One at Munich has nevertheless done great good.

There are but few prisons in *Prussia* in which isolation is exclusively carried out. But in forty-six cellular and associated imprisonment exist side by side; the total number of cells is, however, small when compared with the total population in prison. The advantage of introducing the system of "progressive stages," of passing from strict separation to labor in association, is anxiously discussed, but nothing yet has been done. Prussian prisons may be classed as—(1) those exclusively for hard labor, (2) those for imprisonment and simple detention, and (3) those of a mixed character. Hard-labor sentences may be for any term from one year to life; the labor is compulsory, without restriction, both inside and beyond the walls. The maximum of simple imprisonment or detention is for five years, during which time a prisoner is not compelled to work except in accordance with his capacity and the position he occupied in social life; nor need he work outside the prison against his will. Imprisonment in a fortress, which may be for life and the minimum of which is for one day, means simple deprivation of liberty. There is also a detention on summary conviction for vagrants and beggars limited to six weeks. These may be made to work inside or outside the prison. There is no penal labor; but much variety and enterprise exist as regards the prison industrial employments, which, in addition to the ordinary kinds, include feather-scraping, leather-dressing, turning, carving, illuminating, etc. The males also farm; the women make gloves, cigars, and tapestry, embroider, knit, weave, and spin. The work is carried on through contractors, who pay a certain sum on the amount produced. A portion of their earnings goes to the prisoners,—half of it to be expended in buying extra food, half accumulated against release. To reduce evils of association it is ordered that first sentences shall be separated from hardened offenders, but this classification is not always possible; juvenile prisoners are, however, kept apart in cells. Release, provisionally, may take place after three-fourths of the sentence has been endured with good conduct, but the license to be abroad may be revoked for a breach of law. There are many prisoners' aid societies, the best being in Rhenish Prussia and Westphalia, but the results obtained have not been very satisfactory. Employers and free workmen will not receive liberated prisoners freely, and the aid societies would effect more if they were more centralized and worked more together. Prussian prisons are on the whole well organized; the discipline is severe yet just; order reigns everywhere; secular instruction and religious ministrations are ample, and the employment of prisoners according to their capacities is carefully attended to. But many of the prisons require rebuilding or reconstruction; isolation at night should be the universal rule; and more cells are needed to ensure the separation

of the trial prisoners and short sentences. Administrative centralization is much needed in Prussia.

Prison discipline has attracted close attention in the kingdom of *Saxony* since 1850, when the penitentiary at Zwickau was first opened and conducted with satisfactory results. In 1854 it was decreed that all Saxon prisons should follow the same system, which is that of treatment either solitary or associated according to individual wants; neither rule obtains exclusively, and the prisons have facilities for both. Work, education, and diet are supposed to be carefully allotted to prisoners. The prisons follow the usual classification of German prisons; there are those for severe punishment, two in number, three for less severe punishment, and two for the older offenders. Besides these there are the fortresses and the prisons of detention. The labor is purely industrial, not penal; Saxony is a very industrial country, and its prisons produce nearly every article of manufacture. Work is carried out in them partly by contractors and partly by the authorities. In the five reformatories agriculture is the principal occupation. A graduated system of remission of sentences is in force, dependent on industry and conduct.

In *Württemberg* the cellular system was adopted for women in 1865, and a prison on that plan erected at Heilbronn, which has since been utilized exclusively for men. The bulk of the *Württemberg* prisons are, however, still on the collective system; but at all prisons there are places for the isolated detention of a certain number of prisoners. The classification of prisons is much the same as in other parts of the German empire under the penal code of the empire. There is no distinction between penal and industrial labor; the latter is of the varied character followed in other German prisons, and is partly in the hands of contractors, partly in that of the administration. An aid society has existed in *Württemberg* since 1831, and it has numerous ramifications through the country. It does good service in obtaining work, providing tools, and assisting emigration.

Italy.—There is a want of uniformity in the prison system of the Italian kingdom, which is not strange, having regard to the recent unification of the country. The various units which were till recently independent of each other had each its own views. Many varieties of prison discipline, therefore, still remain in force. There are some prisons in which complete isolation is the rule, others where the labor is associated with cellular separation at night. But the largest number are on the collective system. All new prisons of detention are built on the principle of isolation, and this rule is as far as possible strictly observed for all prisoners awaiting trial. This period of detention may be spent in a provincial (*carcere centrale*), district (*circondariale*), or communal (*mandamentale*) jail. Sentences are carried out according to their character in different prisons. There are prisons for those condemned to simple confinement and detention; others for "relegates," others again for reclusion accompanied with hard labor; and twenty are *bagnios* or hard-labor prisons for those sentenced for long periods (up to life), to undergo the punishment of the *ergastolo* or *galera*. The discipline is progressive. In the ordinary prisons a gradual amelioration of condition may be secured by good conduct; in the *bagnios*, besides the exemption from fetters, convicts may gain the privilege of completing the last half of their sentences in one or other of the agricultural colonies. These have been established in various islands of the Tuscan archipelago, as at Pianosa and Gorgona; and an intermediate prison has been established on the island of Capraia for well-conducted prisoners in a last stage of semi-liberty. Associated convict labor has produced good results in Italy. By it all necessary prison buildings have been erected at the penal colonies and at various points on the mainland; it has also been applied to agriculture, the reclamation of land, the construction of storehouses, docks, salt works, and on the improvement of various ports. In the prisons or penitentiaries the labor is industrial, and follows the usual lines. Contractors have generally the control of this labor, receiving the results after deductions for prisoners' earnings to be spent in the usual way and with the obligation to teach trades. On the latter condition contractors are granted the exclusive right to the labor of juveniles in houses of correction; and there are a number of reformatory schools, mostly on a charitable basis, into which are drafted all juveniles, vagrants, and idlers sentenced to compulsory detention.

Mexico.—In Mexico the rule of constant separation for all prisoners has been accepted, but not yet carried out entirely. The old prisons were on the associated system; but new cellular prisons have recently been built, or are in process of construction at Jalisco, Durango, Puebla, and Mexico. These will receive trial prisoners and those sentenced. There is an "hospicio de pobres" for young children; also a special reformatory establishment for children between nine and eighteen. Political offenders are kept apart from

ordinary offenders. All convicted prisoners may earn conditional release on completion of half their whole sentence. This form of release is called preparatory liberty, and for a short time preceding it they are allowed to leave the jails to run errands or seek work. The labor in Mexican prisons is industrial, not penal, and in theory at least the advantages of learning a trade in prison are fully understood. Contracts for prison labor are forbidden. A portion of the proceeds goes to the prisoners, and may be spent in purchasing food or furniture or articles of comfort. There are "protective boards" who visit and seek to improve the prisoners, and independent philanthropists are also admitted. Prisoners on release go to the protective boards, who assist in obtaining them an honest livelihood.

The Netherlands.—Here the treatment a condemned prisoner undergoes depends mainly upon the sentence awarded. The judge at his discretion may direct the imprisonment to be on the solitary or the associated system. This power as regards the first is, however, limited to half the whole term of sentence, and in 1851 it could only be applied to sentences of one year; this was extended in 1864 to two years, and in 1871 to four years,—so that now the maximum of cellular imprisonment to be inflicted is actually limited to two years. There are several prisons on the cellular plan; but in most the two kinds of imprisonment exist side by side. There are four classes of prisons: (1) the central prisons for persons sentenced to eighteen months and upwards; (2) detention prisons for less than eighteen months; (3) prisons of arrest for those sentenced to three months or less; and (4) police or central prisons for those condemned to one month and under. In the three last named are also kept prisoners awaiting trial. As regards classification nothing more is attempted where association is the rule than the separation of the most hardened and previously convicted offenders from other prisoners. Imprisonment is either simple detention or accompanied by hard labor. The latter is industrial only, never penal, and embraces a great variety of handicrafts, most of which are carried out under contractors. But work is also done on account of the state, with the advantage that it is not subject to the fluctuations of supply and demand. All prisoners, except those for short terms, are, if possible, taught a trade. The earnings go in part to the prisoners, to be expended by them in the usual way. Remissions of sentence not exceeding six months may be accorded to all originally condemned to not less than three years, and who have undergone at least half. There is a society for the moral amelioration of prisoners in the Netherlands, which has numerous ramifications, and is devoted to prison visiting and the welfare of prisoners generally. This extends to efforts to obtain employment for them on release, which are praiseworthy, and on the whole eminently successful.

Norway.—Prisons in Norway may be divided into two principal classes, the *Strafarbeidsanstalter*, or penal institutions where prisoners are compelled to labor, and the district prisons established in 1857 for detention and simple imprisonment. (1) The first may be further subdivided into fortress prisons, houses of correction, and the cellular prison or penitentiary of Christiania. This last takes the first convicted for short terms between the ages of eighteen and thirty, the fortresses the longer sentences, and the houses of correction the intermediate terms. All these prisons except that of Christiania are on the associated system, with no attempt at classification beyond the separation of the worst from the least corrupt in workshops or dormitories. The hours of labor are long—fourteen in summer and ten in winter. The labor, conducted solely by the authorities, is industrial; at Christiania cloth manufacture is a principal trade, at Akershuus it is stonemasonry. Most prisoners learn a trade if they are ignorant of one on reception. No portion of the proceeds of their labor goes to the prisoners. There is no regular system of granting remissions. All the penal institutions have chaplains, schools, libraries, and hospitals. Released prisoners are, as far as possible, preserved from relapse by the care taken to provide them with work when free. There are a few aid societies, but their operations are somewhat circumscribed from want of means. (2) The district prisons, fifty-six in number, take summary convictions from four to two hundred and forty days. Imprisonment may be endured on bread and water with regulated intervals, or on the jail allowance. Prisoners in these prisons are not compelled to work, but they can have employment if they wish it. These district jails are also used for the detention of all persons apprehended and awaiting trial, and as debtors' prisons. They are mostly on the cellular plan, especially in the cases of those sentenced to solitary confinement on bread and water and those committed for trial.

Portugal is still behindhand as regards its prison administration. The jails are extremely defective in construction;

the discipline is lax and the management careless. All prisons are on the associated plan; they stand mostly in the market places of the large towns, with the first-floor windows upon the public thoroughfares, so that the inmates are at liberty to talk and communicate with the passers by, whom they importune constantly for alms. Little less lamentable than the neglect of prison discipline is the practice of indefinitely postponing jail deliveries, with the inevitable consequence of frequent failures of justice. Juries often will not convict, alleging that the accused have been sufficiently punished by long detention awaiting trial.

Russia.—Prison discipline was much discussed in Russia as far back as the commencement of the present century, and in the year 1819 a society, now known as the Imperial Society, was established to watch over the administration of prisons. This society still exists, and is affiliated to the ministry of the interior. Its central committee and the provincial committees working under it select the staff of the prisons, and exercise a general surveillance over them. Various classes of prisons have existed in European Russia. As at present organized they consist of—(1) the fortresses, for grave offenders, especially the political and revolutionary,—in these the discipline is very severe; (2) the military prisons, in which the discipline is not less strict; (3) the house of detention, the ancient *ostrog* or stronghold which every town has always had for the safe keeping of prisoners charged with offences,—in these were detained also prisoners awaiting corporal punishment or deportation to a penal colony; (4) the hard-labor prisons, in which were located the labor parties or correctional corps instituted by the emperor Nicholas, organized and disciplined on a military basis; (5) the amendment prisons or houses of industry established by the empress Catherine. These are all on the associated system, and fall very far short of accepted ideas on prison management. But an entirely new cellular prison has recently been erected in St. Petersburg, which is a model of its kind. It is a house of detention for persons awaiting trial, and contains upwards of a hundred cells. All the internal arrangements of this prison are excellent; but it may be doubted whether the Russian Government will embark upon the expenditure necessary to build others of the class. The emancipation of the serfs in 1867, followed by the substitution of imprisonment for corporal punishment, added enormously to the prison population of Russia. A great increase of prison accommodation became necessary, and a commission was appointed to frame a new penitentiary system. This, as now adopted, although not entirely carried out, consists of two parts—punitive imprisonment for short sentences, and penal probationary detention as a preliminary to banishment to a colony. For the first, central prisons, associated not cellular, are being constructed at various points, and a regulated system of labor will be introduced following the lines of that in force in other European countries. For the second, at the end of the probationary period banishment, or, as it is styled in official language, enforced colonization will be the rule.

Deportation to Siberia began in 1591.¹ It was principally used for political prisoners, insurgents, religious dissenters, and conspirators. Large numbers of Poles were exiled in 1758; others again in 1830, and now, since the Nihilist movement, numbers of these implacable foes to the existing régime are regularly despatched to Siberia. The total number deported varies from 17,000 to 20,000 per annum, but this includes wives and children who may elect to accompany the exiles. The sentences are of two kinds—(1) the loss of all rights and (2) the loss of particular rights. The first includes degradation, the rupture of the marriage tie, inability to sign legal documents, to hold property, or to give a bond. The exile must wear prison dress, and have his head half-shaved. He may be flogged, and if murdered would not be much missed. After a lengthened period of probation in prison the exile becomes a colonist and may work on his own account. Those sentenced to the loss of particular rights are only compelled to live in Siberia, where they may get their living as they can. Many, however, are condemned to spend a portion of their time in confinement but without hard labor. The exiles are sent from all parts of the empire by rail or river to Ekaterinburg, and thence to Tiumen, whence they are distributed through Siberia. Those deprived of partial rights are generally located in western Siberia. Those deprived of all rights go on to eastern Siberia. The latter go by river generally to Tomsk; thence they walk to their ultimate resting place, which may be Irkutsk or Yakutsk or Tchita, or the island of Saghalien, and the journey may occupy months. Not

¹ [Dronke says in Pierer's Lexikon, vol. xvi., p. 402, that the first deportation by the Czar was of Samailow in 1688, and judicial deportations began in 1758.—AM. ED.]

long ago a party of convicts was despatched by sea to the last-named destination, embarking at Odessa and travelling through the Suez Canal and by the Pacific Ocean. There are several hundred prisons in Siberia. They are of three kinds: (1) the *etape*, which afford temporary lodgings for prisoners on the line of march; (2) the *prisylnie*, where the detention is often for several months during the winter or until the ice is broken up; and (3) the *ostrog*, the generic Russian name for a prison, which is the place of durance for all exiles not on their own resources. Few of the large prisons in Siberia were built for the purpose. They are converted buildings—old factories, distilleries, and so forth. They are all upon the associate principle, containing a number of large rooms to accommodate any number from twenty-five to a hundred. The great central prison near Irkutsk, called the Alexandreffsky, one of the most important in Siberia, generally holds from 1600 to 2000 prisoners all under sentence of hard labor, and awaiting transfer to the mines. Dr. Lansdell, who visited this prison in 1879, found the prisoners very short of work. Some were engaged in making cigarette papers, others in shoemaking and brickmaking. The prison is a huge stone-built building, very different from the ordinary run of Siberian prisons, which are usually built of logs caulked with moss to keep out the cold. They are surrounded by a high wooden palisade. Each prison has its hospital, chapel, generally a schoolroom, and a few workshops. The prisoners themselves are not unkindly treated. At most of the stations there are local committees to watch over the welfare of the prisoners. This is an extension of the Imperial Society of St. Petersburg already mentioned. The committees supply books and visit the prisoners. They clothe and educate the prisoners' children, and help their wives to employment. They also augment the prisoners' diet from funds obtained by subscription. The regulation rations of Siberian exiles seem very liberal. The Russian prisoner has nearly twice the amount of solid food that an English prisoner receives, and he is at liberty to add to his diet out of his own means, which the English prisoner is not. The prisoners are also supplied with ample clothing if they have none of their own, those sentenced to deprivation of all rights being obliged to wear convict dress. The discipline of the prisons is now in accordance with European ideas. Prison offences are punished by relegation to a solitary cell, a certain number of which exist at all the prisons. Diminutions of diet are also inflicted, and an obligation to wear irons if they are not already worn. All exiles wear leg-irons for a certain time. These are riveted on to the ankles, and caught by a chain which is carried suspended to a belt round the waist. The irons are worn for various periods from eighteen months to four and even eight years. Very heinous offenders or those who have escaped frequently are chained to a wheelbarrow, which they are obliged to pull about with them wherever they go. A more severe punishment when confinement and irons fail is birching with a rod, for the knout is now abolished. The rod consists of switches so small that three may be passed together into the muzzle of a musket. The punishment is described as not more severe than that inflicted at English public schools. There is another flagellator, however, called the *plete*, a whip of twisted hide, which is still retained at a few of the most distant Siberian prisons and only for the most incorrigible, on whom irons, the birch, and other punishments have had no effect. The costliness of deportation is enormous and the results it obtains doubtful. The slow colonization of this vast territory may follow eventually, but there are already great difficulties in finding employment for the mass of labor in the Government's hands. The mines of gold, silver, and coal are passing into private hands, and there are no other public works. Hence part of the Russian criminals who would have gone to Siberia are detained in the large prisons in Russia, where they are employed in manufactories or in the labors of ordinary mechanics, or any outdoor work such as making bricks, mending roads, and manufacturing salt. Nevertheless recent visitors to Russian prisons, whether in Russia proper or in the heart of Siberia, describe the prisoners as generally idle. The principle of progressive stages by which a prisoner can gain a remission of sentence or milder treatment prevails throughout. The well-conducted persons can earn wages, and may spend the money in buying an increase to their diet. The bulk of the worst convicts gravitate to the island of Saghalien, where the number in 1879 was about 2600. Half of those were kept in prison, half remained comparatively free. The discipline here is very severe. The diet is said to be scanty, and as the island is barren everything has to be imported. Fish, however, is found in large quantities. There are four large prisons at Dui, the principal post on the island, which are insufficiently heated in winter and generally overcrowded. The convicts are chiefly employed in raising coal

from mines which are let to a company. Very conflicting evidence is current as regards the Siberian prisons. Prince Kropotkin, an exile, speaking with some authority, denounces them as hotbeds of vice and cruelty. Dr. Lansdell on the other hand, a reputable eyewitness, does not on the whole speak unfavorably of them. He describes them as rough, perhaps; but so are Siberian dwellings. He thinks that as compared with the English convict the Siberian is not badly off. The labor is lighter; he has more privileges; friends may see him oftener and bring him food; and he passes his time neither in the seclusion of a cell nor in unbroken silence, but among his fellows with whom he may lounge, talk, and speak. The Russian convict, however, misses those intellectual, moral, and religious influences which are abundantly showered upon the English. There are no prisoners' aid societies in Siberia, and the convict, after release, when suffered to begin life again on his own account, carries with him always the convict stain and is hindered rather than helped to begin life afresh. Dr. Lansdell sums up his opinion in these words:

"Taken at the worst, condemnation to the mines is not so bad as it seems; and, in the case of peasant exiles willing to work, I cannot but think that many of them have a better chance of doing well in several parts of Siberia than at home in some parts of Russia. There is reason to suppose that reports of the ill-treatment of Russian prisoners have been greatly exaggerated by careless, ill-informed, or malicious writers. No doubt some years ago there were good grounds for serious complaint. It is very evident that now the political prisoner, beyond exile, and temporary confinement in the jail, is not ill-used. He is not always subjected to the ordinary discipline of the criminal convict, nor is he obliged to associate with them. A fabulous story has long been current that the worst criminals were buried alive in quicksilver mines, where they were speedily killed by the unhealthy fumes. There are no quicksilver mines in Siberia, and the principal mines, those of Nerchinsk, are now passing out of Government hands. These are mostly of silver, although other minerals and gems are found in the neighborhood. The hours of labor in the Nerchinsk mines were thirteen, and it was the same at the Kara gold mines. The convicts arrange their hours of work themselves. No definite amount of mineral was required, so they might work hard or not as they pleased. No doubt the lot of convicts in these mines was hard. Besides the laxity of discipline, the herding together of the worst characters and the deprivation of social, intellectual, and religious privileges must have made life a burden to many."

Spain, like Portugal, still lags behind. It is not to the credit of a country in which prison discipline was discussed three centuries ago that now at the close of the 19th its prison system is about the worst in Europe. Till very recently the posts of governors in the jails were sold to the highest bidder, and purchasers were suffered to recoup themselves out of the unfortunate wretches committed to their charge. The principal prison in the capital of the kingdom was nothing more than a converted slaughter house where pigs were killed and salted, as its name, the *Saladero*, implied. This dark, dirty noisome den, although generally condemned, continues to serve even now. Numerous efforts to provide a more suitable prison have been made from time to time. The construction of model prisons was decreed as far back as 1847, but in 1860 nothing had been done, and a new project was brought forward. Again in 1869 a fresh scheme replaced the previous ones, which were still dead letters. Seven more years elapsed, and in 1876 a new law was passed providing for the construction of a new cellular prison in Madrid with cells for a thousand prisoners. This law too hung fire, and the prison is not yet completed. The bulk of the prison population in Spain is still sent to *presidios*, or convict establishments, where general association both in the prison and at labor is the rule. The principal of these are situated at Cartagena, Valencia, where there are two prisons, Valladolid, Granada, and Burgos. There are also prisons at Alcalá, Tarragona, Saragossa, and Santofia. Persons convicted of grave crimes are deported to the Balearic Islands or to the penal settlements in Africa, the principal of which are situated at Ceuta and Melilla. Throughout these establishments there is an utter absence of sanitary regulations; the diet is coarse and meagre; the discipline is brutal; the authorities are quite callous; and morality does not exist. The Spanish authorities, however, claim the credit of having abolished corporal punishment in their prisons.

Sweden.—A great impetus was given to prison reform in Sweden by the interest taken in the question by King Oscar I. in 1840. Following special legislation, thirty-eight new cellular prisons were built in the various provinces of the kingdom. These prisons have been used since for all prisoners awaiting trial, those condemned to reclusion and those sentenced to imprisonment with hard labor for two years and under. Persons sentenced to pay fines, but unable to pay, go to the cellular prisons. The isolation is continuous day and night. Besides these cellular there are a number of associated prisons for terms longer than two years and

up to life. The labor in the first-named is of the usual kind—tailoring, shoemaking, and some kinds of carpentry. Trade instructors are specially appointed, so as to provide a prisoner on liberation with some employment. In the associated prisons there is more variety of work: linen and woollen cloths are manufactured, timber split up for matches, granite cut and dressed for buildings and pavements. The female prisoners weave textile fabrics, and make match boxes. A portion of the earnings is granted to prisoners, which, to a limited extent, may be spent in buying extra food. There is no purely penal labor, nor any regulated system of granting remissions for industry or good conduct. Many aid societies were formed about twenty-five years ago, but through want of success or funds their number has dwindled down to two.

Switzerland.—From the complete independence of each canton, each has its own special penal system and places of imprisonment. Hence the systems are various, and are not all equally good. The prisons of Switzerland may be divided into four groups: (1) those of the cantons of Uri, Schwyz, Unterwalden, and Valais, which are still of a patriarchal character; (2) those of Fribourg, Basel (rural), and Lucerne, which are on the associated plan and unsatisfactory from every point of view; (3) those of the cantons of St. Gall, Vaud, Geneva, and Zurich, which have prisons for associated labor and separation at night, while Soleure, Grisons, Bern, and Schaffhausen are laboring to raise their prisons to this level; (4) the penitentiaries of Lenzburg, Basel (urban), Neuchâtel, and Ticino, which are good modern prisons in which the cellular system is completely applied. The system is one of progression, the prisoner passes through several stages of isolation, employment in association, and comparative freedom; but only at Neuchâtel is there separation by day as well as night. The general principle is one of collective imprisonment; but there is an attempt at classification, according to degrees of morality, in the best prisons. Sentences may be either to imprisonment or reclusion with hard labor. The first may be from twenty-four hours to five years; the second from one year to fifteen, twenty, thirty years, or to life. An abbreviation of punishment may under all the cantonal laws be obtained, but such reduction is rarely made according to fixed rules. In most of the cantons prisoners have a share in their own labor. This labor is chiefly industrial, but there is a form of penal labor to be seen where the plan has survived of employing certain prisoners to sweep the streets, make roads or dyke the rivers. Such labor is felt to have a bad moral effect, and industrial labor is preferred. The latter is conducted by the administration itself, and not by contractors. It is thought that the state can introduce a greater variety of employments, and control the prisoner better when at labor than could free employers. Aid societies exist in most of the cantons; the first was established at St. Gall about 1845. Wherever they exist the societies protect prisoners in duress and assist prisoners on release by providing tools and employment with private persons. The only drawback in the Swiss aid societies is the want of organization and uniformity of action.

United States.—There is no uniform prison system in the United States. The variety of jurisdictions following the constant extension of territory and development of communities more or less populous perpetuates changing conditions, and the supreme Government has not concerned itself greatly with prison affairs, and has claimed no supervision or special control. The rule of local self-government has left each jurisdiction to manage its prison according to its own ideas, and hence the utmost diversity of practice still obtains. While some prisons are as good as need be, others are marked with many defects. There is a wide distinction between the best and the worst. In the country which initiated prison reform, numbers of prisons exist nowadays which fall far below the commonest requirements of a good prison system. Taken broadly the prisons of the Union may be classed into—(1) State prisons; (2) district prisons; (3) county prisons; (4) municipal or city prisons. Each State as a rule has its own State prison, but Pennsylvania and Indiana have two and New York three such prisons. The cellular system, or the rule of continuous separation, to which reference has been made already (see p. 772), was at first followed by several States, but gradually abandoned in favor of the so-called silent system, or that of labor in association under the rule of silence, with cellular separation at night. At the present time there is but one prison, the Eastern Penitentiary of Philadelphia, managed on the purely solitary plan. Of the long-sentenced convicts 96 per cent. are now confined in congregate prisons. There are about forty State prisons in all. Of the district prisons intermediate between the State and the county prisons there are but few. The county prisons are by far the most numerous. The county in the United States is the unit of political organization

under the State, and, with area and population comparatively limited, is a convenient subdivision for the purposes of the criminal law. Hence it has been asserted that no one knows exactly the number of county prisons in the United States, but it has been computed at upwards of two thousand. The city or municipal prisons are also very numerous and constantly increasing. Each and every one, as in the State prisons, is managed locally by local authorities, with the inevitable result of the utmost diversity in practice, and often enough the utmost neglect of the commonest rules of prison discipline. A self-constituted body inspected a couple of hundred of these jails a few years back, and reported that they were mostly defective from a sanitary point of view, insecure, and so constructed as to compel the promiscuous association of all classes, old and young, the guilty and innocent, the novice and the hardened in crime. The sexes even were not invariably separated. Little or no employment was provided for the prisoners, and in few prisons was any effort made to compass religious or intellectual culture. An eyewitness, Dr. Wines, reporting of other jails of the same class still more recently, unhesitatingly condemned them. "Ohio, to-day," says the Ohio Board of Charity, "supports base seminaries of crime at public expense." "In our jail system lingers more barbarism than in all our other State institutions together." Yet there are a few and conspicuous exceptions to the general verdict of condemnation. The discipline and management of the district prisons at Albany, Detroit, Rochester, and Pittsburgh are excellent. The good example is gradually becoming more and more largely imitated. Where good prisons exist it will be found that their administration remains for some length of time in intelligent hands, free from the "pernicious influence of partisan politics." The chief drawback to improvement is the uncertainty no less than the complexity of the governing bodies. These are apt to be changed capriciously; and, what is worse, they are needlessly intricate and often far too numerous. They act independently, without reference to each other, and they are not too ready to benefit by example and experience. What is wanted is a supreme central authority over all the prisons of a State, if not throughout the Union. Wherever there is the nearest approach to this the results are most satisfactory.

It is not strange that under these conditions discipline should also vary greatly, or, as has been said "every variety of discipline, lack of discipline, or abuse of discipline is found." Neither the deterrent nor the reformatory agencies are properly or uniformly brought to bear. Prison punishments are still severe; although flogging is nominally abolished, it is said to be still practiced in prisons where it is forbidden; and some more ancient methods such as the yoke, the shower bath, and the iron crown have not yet entirely disappeared. There is, however, often good secular and religious instruction. The dietaries are fuller than on the opposite side of the Atlantic, meat is a more common ingredient, and Indian meal is very largely issued. The financial results obtained are not unsatisfactory: many of the State prisons are now self-supporting, and an examination of the labor returns will prove that much enterprise has been displayed in finding employment for the prisoners. There is no purely penal labor, although much of the labor performed is sufficiently severe. There may be no tread-wheel or cranks, but convicts in Alabama and Texas have been employed to build railways; they have raised cotton in Mississippi, and have worked mines in Tennessee and New York, while in many States they are utilized in gardening and agriculture. A great deal of labor has been expended on quarrying and dressing stone for building, or for burning into quicklime; at Auburn there is a large manufactory of agricultural tools; Ohio employs saddlers; Massachusetts prisoners make ornamental iron work; in Michigan they tan leather; and at Dannemora, in northern New York, iron ore is quarried, smelted, forged, and wrought into nails by the prisoners. In general the labor is hired by contractors at a fixed sum per day, which varies from a few cents to as much as a dollar. The chief cause for the present inadequacy of the American prisons, over and above the faults in administration already mentioned, is probably the rapidly increased demand on their accommodation in recent years. This is due partly to the growth of population, partly also to the influx of "colored" criminals since the emancipation. In the days of slavery the slave was punished summarily by his master, but now he is arraigned and sent to prison. The result has been that the prisons were suddenly crowded before any new and improved system could be introduced.

While there are but few agencies for the assistance of discharged prisoners, considerable care is devoted in the United States to the treatment and checking of juvenile crime. Reformatories have existed since 1825, when the

first was established on Randall's Island within the limits of the city of New York. Others followed; but these did not form part of the penal system of the States till 1847, when the State reform school at Westborough, Massachusetts, was established by law. They soon increased and multiplied, and now between sixteen and twenty are to be found within the principal States. There are also a number of semi-public schools. The average reformatory population is about 15,000. The results are said to be very satisfactory. The percentage of youths reformed and trained into good citizens has been placed as high as 60, 75, even 80 per cent. Parents may in some States contribute to the support of their children in reformatories, but as a rule the inmates are orphans or abandoned children or those whose parents are very poor. The best system for training and caring for juvenile offenders probably is that which obtains in Massachusetts.

(A. G.)

PRISREND, PRISDREN, PRISDRA, PISDRA, PISREN, or PISRA, in Roumelia, the chief town of a sandjak and the seat of a Greek and a Roman Catholic archbishop, in the Turkish vilayet of Kossovo (formerly Monastir), stretches for 2 or 3 miles along the north-western base of the Scardus or Shar-dagh, and is traversed by the rapid waters of the Resna Mitritza, which, issuing from a deep gorge a little above the town, joins the Drin (White or Albanian Drin) a few miles below. To the north-northwest of Prisrend, which lies at a height of 1577 feet above the sea, a great undulating and fertile plain extends for more than 40 miles towards Ipek. In 1865 the Roman Catholic archbishop estimated the total at 50,000 (8000 Mohammedan families, 3000 Greek, and 150 Latin). It is now about 46,000. There is a castle on the buttress of the Scardus, at the foot of which lies the Christian quarter, with a small brick-built ancient-looking Byzantine church. The old cathedral, now a mosque, is also a Byzantine building. Prisrend, doubtfully identified with Tharendus, was at one time the capital of Servia, and the district is still called Old Servia. At present the town owes much of its importance to its manufacture of arms; and it also produces glass, pottery, and saddlery.

PRIVATEER is an armed vessel belonging to a private owner, the subject of a belligerent power, commissioned by the sovereign of that power. The commission is either a commission of war or of marque and reprisals in time of peace. It was marque in this sense which was granted to aggrieved subjects of the realm of England as early as the statute 4 Hen. V. c. 7. The term "letters of marque," however, is now generally applied less strictly to the commission under which a privateer sails in time of war. The acceptance of a commission from a belligerent power by a neutral, though not piracy by the law of nations, has frequently been made so by treaty.¹ Acceptance of such a commission by a British subject is forbidden by the Foreign Enlistment Act, 1870. A vessel with a commission from each of two powers at war with one another is a pirate by the law of nations. Privateers stand in a position between that of a public ship of war and a merchant vessel. They are not entitled to the full rights which the comity of nations extends to public ships of war; e.g., by the municipal regulations of most nations they may not carry the flag of a public ship of war. A capture made by a privateer may either become the property of the captor or, following the general rule of international law, the property of the state (see PRIZE). In Great Britain, in order to encourage privateering, the prize taken by a privateer was formerly divided between the owners and the captors, and the rights of the crown were specially excluded in numerous Prize Acts. But now, by the Naval Prize Act, 1864, a prize made by a privateer belongs to the crown in its office of Admiralty. By the United States Prize Act of 1864, the whole proceeds of a prize made by a privateer go, unless it is otherwise provided in her commission, to the captors. The

sum awarded is divided, in the absence of agreement, equally between the owners and the ship's company.

Privateering is now a matter of much less importance than it formerly was, owing to the terms of Art. 1 of the Declaration of Paris, April 16, 1856, "Privateering is and remains abolished." The declaration binds only the powers who are signatories or who afterwards assented, and those only when engaged in war with one another. The United States, Mexico, Uruguay, and Spain have not acceded to it, and thus it would not hold in case of a war between the United States and any other power, whether the latter were bound by the Declaration or not. By the constitution of the United States, Congress has power to grant letters of marque and reprisal. Congress, by an Act of March 3, 1863, authorized the issue of letters of marque by the president, but they were never in fact issued either by the United States or Confederate Government.

In the Franco-Prussian war of 1870, Prussia, in spite of the Declaration of Paris, took a course very little removed from privateering in the creation of a volunteer fleet.

PRIVET (*Ligustrum*), the vernacular name² of a genus of *Oleaceae*. There are several species, all of them shrubs or low trees with evergreen or nearly evergreen opposite entire leaves, and dense cymes of small white tubular four-parted flowers, enclosing two stamens and succeeded by small, globular, usually black berries, each with a single pendulous seed. The best-known species is the common European privet, which makes good hedges in cases where no great powers of resistance to the inroads of cattle, etc., are required. *L. ovalifolium* thrives by the seaside and even in towns, and is thus a valuable all but evergreen shrub. *L. lucidum* is taller and handsomer. There are several other species, mostly natives of China and Japan, some of which when attacked by a species of scale-insect (*Coccus*) yield a waxy substance.

PRIVILEGE, in law, is an immunity or exemption conferred by special grant in derogation of common right. The term is derived from *privilegium*, a law specially passed in favor of or against a particular person. In Roman law the latter sense was the more common; in modern law the word bears only the former sense. Privilege in English law is either *personal* or *real*,—that is to say, it is granted to a person, as a peer, or to a place, as a university. The most important instances at present existing in England are the privilege of parliament (see PARLIAMENT), the privilege which protects certain communications from being regarded as libellous (see LIBEL), and certain privileges enjoyed by the clergy and others, by which they are to some extent exempt from public duties, such as serving on juries. Privileged copyholds are those held by the custom of the manor and not by the will of the lord. There are certain debts in England, Scotland, and the United States which are said to be privileged, that is, such debts as the executor may pay before all others—for example, funeral expenses or servants' wages. In English law the term "preferred" rather than "privileged" is generally applied to such debts. There are certain deeds and summonses which are privileged in Scotch law, the former because they require less solemnity than ordinary deeds, the latter because the ordinary *induciae* are shortened in their case (see Watson, *Law Dict.*, s.v. "Privilege").

In the United States the term privilege is of considerable political importance. By Art. IV. § 2 of the constitution, "the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States." By Art. XIV. § 1 of the amendments to the constitution (enacted July 28, 1868), "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States." It will be noticed that Art. IV. applies to citizens of the States, Art. XIV. to citizens of the United States. "The intention of this clause (Art. IV.) was to confer on the citizens of each State, if one may so say, a general citizenship, and to communicate all the privileges and immunities which the citizens of the same State would have been entitled to under the like circumstances" (Story,

¹ Instances will be found in Phillimore, *International Law*, vol. i. pt. iii. ch. xx.; Twiss, *Law of Nations*, vol. ii. ch. x.

² Another form of the name, *primprivet*, *primprint*, or *primet*, like *ligustrum* itself, used at one time to be applied to the *primrose*.

Constitution of the United States, § 1806). The clauses have several times been the subject of judicial decision in the supreme court. Their practical effect may be thus illustrated. With regard to Art. IV., it was held that a State license tax discriminating against commodities the production of other States was void as abridging the privileges and immunities of the citizens of such other States (*Ward v. State of Maryland*, 12 Wallace's Reports, 418). With regard to Art. XIV. 1, it was held that its main purpose was to protect from the hostile legislation of the States the privileges and immunities of citizens of the United States, looking more especially to the then recent admission of negroes to political rights. Accordingly it was held that a grant of exclusive right or privilege of maintaining slaughter-houses for twenty-one years, imposing at the same time the duty of providing ample conveniences, was not unconstitutional, as it was only a police regulation for the health of the people (*The Slaughter-House Cases*, 16 Wallace, 36). The same has been held of a refusal by a State to grant to a woman a license to practice law (*Bradwell v. The State*, 16 Wallace, 130), of a State law confining the right of suffrage to males (*Minor v. Happersett*, 21 Wallace, 162), and of a State law regulating the sale of intoxicating liquors (*Bartemeyer v. Iowa*, 18 Wallace, 129). Suits to redress the deprivation of privilege secured by the constitution of the United States must be brought in a United States court. It is a crime to conspire to prevent the free exercise and enjoyment of any privilege, or to conspire to deprive any person of equal privileges and immunities, or under color of law to subject any inhabitant of a State or Territory to the deprivation of any privileges or immunities (*Revised Statutes of the United States*, §§ 5507, 5510, 5519).

PRIVY COUNCIL. In England the king almost of necessity has been at all times guided by a council. The council, as it existed in the Norman period under the name of *curia regis* (a branch of the larger *commune concilium regni*), exercised judicial, legislative, and administrative functions. It contained the germs of the courts of law and equity, the Houses of Parliament, and the privy council. The Courts of King's Bench and Common Pleas were gradually separated from it and became only courts of first instance, subject to appeal to the king's council. From the time of Edward I. the *concilium ordinarium*, the ordinary or standing council of the king, superseded the *curia regis*. It exercised high judicial functions as the ultimate court of appeal, as the adviser of suitors on petition what court to choose for redress, and as the resort of those who failed to obtain justice in the ordinary course. It was also the supreme administrative body, and as such issued ordinances on matters of a local or temporary nature, with not infrequent usurpations at a later period of jurisdiction belonging more properly to the common law courts or to parliament. The council "consisted of the chief ministers, the chancellor, treasurer, lord steward, lord admiral, lord marshal, the keeper of the privy seal, the chamberlain, treasurer, and comptroller of the household, the chancellor of the exchequer, the master of the wardrobe; and of the judges, king's serjeant, and attorney-general, the master of the rolls, and justices in eyre, who who at that time were not the same as the judges at Westminster" (Hallam, *Middle Ages*, vol. iii. p. 205). The growing power of the ordinary council (it does not seem to have been called the privy council until after the reign of Henry VI.) led to many complaints on the part of the Commons, some of which found their expression in statutes. The most worthy of notice is 25 Edw. III. st. 5, c. 4, characterized by Hallam as probably the most extensively beneficial enactment in the whole body of our laws. Among other provisions it prohibited arbitrary imprisonment and the determination of pleas of freehold before the council. The power of the council expanded or contracted according to the vigor of the king. Its authority was finally reduced by the Long Parliament in 1640 by means of 16 Car. I. c. 10. Assumption of jurisdiction over freeholds was still a grievance, for the Act specially declared that the king's council has no jurisdiction over any man's land, goods, or chattels. From the beginning of Edward III.'s reign the council and the House of Lords were often blended into one assembly, called the *mag-*

num concilium or great council. As it met only when summoned by writ and not daily, like the ordinary council, it could scarcely have exerted as much authority as the latter. It is therefore not surprising to find it soon split permanently into its two component parts, each retaining both judicial and legislative authority. The privy council still exercises authority of both kinds, though not as completely as the House of Lords. The political importance of the privy council has almost entirely disappeared since the duties of government have been assumed by the cabinet. Its modern legislative jurisdiction is of a subordinate character. Its position as a court of appeal from the foreign possessions of the crown is a strictly logical one. It was always the court for redress where no other redress could be obtained. For the sake of convenience this jurisdiction in cases of what is now called equity was exercised by the chancellor, originally the president of the ordinary council when it sat as a court of justice. But in cases for which equity made no provision, as being out of the bounds of the realm, the privy council still exercises to the full one of the most ancient parts of its jurisdiction. Appeals lay from foreign possessions by virtue of the prerogative, but are now generally regulated by statute. The jurisdiction of the High Court of Delegates over ecclesiastical and admiralty cases was transferred to the privy council in 1832. The council lost its probate appeal jurisdiction in 1857, its admiralty jurisdiction in appeals from England in 1875, from Ireland in 1877.

At the present day members of the privy council become so at the will of the crown, but it is understood that persons in certain positions have an *ex officio* claim to be nominated. The council consists of princes of the royal family or of some of the great officers of state, such as the principal members of the Government, the archbishops and the bishop of London, the judges of the House of Lords, the judicial committee, and the court of appeal, diplomatists of high rank, etc. Members of the privy council have the title of "right honorable" and social precedence next after knights of the Garter. Ireland has its own privy council. Scotland has had none of its own since 6 Anne c. 40, which provided for one privy council for Great Britain. The modern jurisdiction of the privy council may be divided into two branches, administrative and judicial.

Administrative.—This jurisdiction chiefly depends upon statutory authority, which practically makes of the privy council a subordinate legislature. It is exercised either by the whole council or by committees to which matters are referred by the crown in council. Examples of the latter are the board of trade, the committee of council on education, the local government board (see PUBLIC HEALTH), the universities committee, with temporary powers under the Universities Act, 1877, and the committee of council for the consideration of charters of incorporation under the Municipal Corporations Act, 1882. Cases affecting the constitutional rights of the Channel Islands are referred to a committee for the affairs of Jersey and Guernsey. The committees report to the crown in council, and their report is adopted and enforced by an order in council, published in the *Gazette*. Among other Acts conferring administrative powers upon the privy council are the Pharmacy Act, 1852, as amended by 31 & 32 Vict. c. 121, the Medical Act, 1858, the Foreign Enlistment Act, 1870, the Destructive Insects Act, 1877, the Contagious Diseases (Animals) Act, 1878, the Dentists Act, 1878, the Veterinary Surgeons Act, 1881.

Judicial.—Up to 1833 the judicial authority of the privy council was exercised by judicial committees appointed from time to time for the hearing of appeals referred to them by the crown in council. In 1833 the judicial committee of the privy council was established as a permanent court by 3 & 4 Will. IV. c. 41. Under this and later Acts the judicial committee now consists of the lord president, the lord chancellor, and other persons who fill or have filled high judicial offices (all unpaid), of two retired Indian or colonial judges who receive an allowance for attending the sittings of the committee, and of paid members, now two in number, appointed under 34 & 35 Vict. c. 91. The Appellate Jurisdiction Act, 1876, provides for what is in effect the union of the House of Lords and of the privy council in their judicial capacities by the lords of appeal in ordinary gradually becoming judges of both courts. After the death or resignation of the present paid members these two high judicial bodies will be practically combined, and a near approach will be made to the mediæval *magnum concilium*

in an ultimate court of appeal from the whole of the British dominions.

In proceedings under the Church Discipline Act archbishops and bishops who are members of the privy council are members of the judicial committee, 3 & 4 Vict. c. 86. In proceedings under the Public Worship Act, 1874, archbishops and bishops attend as assessors according to rules made by order in council, 39 & 40 Vict. c. 59 § 14. The jurisdiction of the judicial committee is either original or appellate. The original jurisdiction is the less important, and consists of certain powers conferred by the Copyright, Patent, Endowed Schools, and other Acts. The power most frequently exercised is that of extending the term of patents. The appellate jurisdiction is entirely regulated by statute, with the exception of the rarely occurring appeal from orders made by the lord chancellor of Great Britain or of Ireland in exercise of powers conferred by royal sign manual for the custody of idiots and lunatics. Appeals lie from the Arches Court of Canterbury, from a vice-admiralty court abroad, and from the Channel Islands, the Isle of Man, India, and the colonies. Appeals are either of right or by leave. Appeals lie as of right when the value of the matter at issue is of a certain amount (the amount varying according to the appeal rules of the different foreign possessions), and in a few other cases. Appeals lie at the discretion of the judicial committee, on leave being obtained by petition for special leave to appeal. The proceedings in all cases alike, whether original or appellate, are by petition (see PETITION). The petition is addressed to the crown in council in the first instance.

(J. W.)

PRIZE, or PRIZE OF WAR, denotes the ship or goods of an enemy, or *in transitu* to an enemy, captured at sea. Goods captured on land are not prize, but booty of war. To be good prize the capture must be on the high seas or in the territorial waters of one of the belligerents, and must be by an armed vessel duly commissioned by the sovereign of the captor. A capture made in neutral waters is a violation of neutrality, and may be restored at the discretion of the neutral power. Most nations have municipal regulations upon the subject. Thus prize captured in breach of the neutrality of Great Britain may be restored by the High Court of Justice (Admiralty Division) under the powers of the Foreign Enlistment Act, 1870, 33 & 34 Vict. c. 90, § 14. Capture may be actual or constructive. Constructive or joint captors are those who have assisted the actual captors by conveying encouragement to them or intimidation to the enemy. All public ships of war within signalling distance are usually held entitled to share in the proceeds of the capture. This rule is incorporated in the United States code of prize law, the Act of Congress of June 30, 1864. It is not all enemy's property that is good prize. The conflicting interests of neutrals have led to modifications of the general belligerent right of seizing enemy's property wherever found, a right which had become established as part of the general maritime law as early as the *Consolato del Mare* (see vol. vi. p. 282, and SEA LAWS). By the rules laid in the *Consolato* neutral vessels or neutral goods were to be restored to the owners without compensation for the loss of time and other inconveniences attending capture. This may be said to have been the general law of the sea down to 1856. At the same time it is to be noticed that two doctrines inconsistent with the original rule had met with the sanction of certain nations, *viz.*, (1) the French doctrine of hostile infection, by which neutral property on an enemy's ship or a neutral ship carrying enemy's property was a good prize; (2) the Dutch doctrine, by which the character of the ship alone was regarded—free ship made free goods, enemy ship enemy goods (see Twiss, *Law of Nations*, vol. ii. ch. v.). In 1856 the Declaration of Paris adopted an intermediate system. To this Declaration most nations have acceded (see PRIVATEER). By article 2 of the Declaration, "the neutral flag covers enemy's goods, with the exception of contraband of war." By article

3, "neutral goods, with the exception of contraband of war, are not liable to capture under an enemy's flag." Contraband of war, speaking generally, includes all articles, such as provisions and munitions of war, likely to add to the military or naval resources of the enemy (see CONTRABAND). After the capture has been made, the next proceeding is the determination of its legality. It is now an understood rule of international law that the question of prize or no prize must be determined by a qualified prize court (see below). Captors should send their capture to a convenient port, if possible a port of their own nation or an allied power, for adjudication. They may forfeit their rights by misconduct in this respect. The property in the prize vests in the sovereign, in accordance with the old maxim of law *Porta bello cedunt reipublice*. This right attaches both in cases of capture and recapture, subject in the latter case to what is called the *jus post-liminit*, that is, the right of the owner of property recaptured from the enemy to have it returned—formerly if the recapture has taken place before the property had been taken within the enemy's territory (*infra præsidia*), at present if less than twenty-four hours has elapsed between the capture and recapture. The right of the recaptors to salvage on recapture is regulated by the municipal law of different nations. By English law one-eighth of the value is the sum usually awarded, but this may be increased to one-fourth under special circumstances. The right does not exist at all if the vessel has been fitted out as a vessel of war by the enemy, 27 & 28 Vict. c. 25, § 40. One-eighth is awarded for recapture from pirates, 13 & 14 Vict. c. 26, § 5. In the United States, by the Prize Act of June 30, 1864, salvage on recapture is allowed according to the circumstances of the case. There is no sum fixed as in England. Although the prize vests in the sovereign, it has been held in England that the captors have an insurable interest in the prize immediately after capture and before condemnation on the ground that under the Prize Act the captors have a certain expectation of profit upon the safe arrival of the prize in port, and that they are liable to condemnation in damages and costs if the capture be unjustifiable. By the general maritime law a prize may be released upon ransom; but it has been the general policy of European nations to discountenance ransom as less beneficial to the state than the detention of a prize. Thus an Act of 1782, and subsequent Acts, avoided ransom bills given by British subjects, and subjected a commander giving one to an enemy to penalties, unless in either case the circumstances were such as to justify the giving or taking of the bill. The Naval Prize Act, 1864, is less strict in its terms. It enacts that the queen in council may from time to time in relation to any war make such orders as are expedient as to contracts for the ransoming of a ship or goods; contravention of the orders makes the contract void and renders the offender liable to a penalty not exceeding £500 [\$2430], 27 & 28 Vict. c. 25, § 45. By the Naval Discipline Act, 1866, a commanding officer making an unlawful agreement for ransom is liable to be dismissed from the service, 29 & 30 Vict. c. 109, § 41. The United States have never prohibited ransom bills. The rights of the sovereign to prize may be waived, as was formerly done by the crown of Great Britain in the case of privateers (see PRIVATEER).

Many statutes dealing with prize have been enacted at different times in England. The first general Prize Act was 6 Anne c. 13. The Act that now regulates prize is the Naval Prize Act, 1864, already referred to. Various offences in relation to prize are dealt with by the Naval Prize Act and the Naval Discipline Act. Such are false swearing in a prize cause or appeal, taking money, etc., out of a ship before condemnation, ill-using persons on board the prize, etc., or breaking bulk with a view to embezzlement. Prize is subject to the usual customs regulations. The United States Prize Act is the Act of June 30, 1864, just seven days later in date than the British Prize Act. The two Acts are similar in character, but the United States Act is more full and

definite than the British, as it deals with some matters which in Great Britain are left to the discretion of the executive.

Prize Court.—This is a court sitting by the commission of the sovereign of the captor for the determination of prize causes. A capture does not become good prize until condemnation by a prize court. As a general rule the court must be commissioned by the sovereign, must sit in the country of the captor, and must be in possession of the prize. In the case of allied powers, it is usually agreed (as it was between Great Britain and France in 1854) that the decision shall be made by a court of the country to which the officer in command belongs. A prize court may sit in the territory of an ally, though this is irregular; but it is a violation of neutrality to constitute a prize court within the limits of a neutral power. A prize may, however, in case of necessity be brought into a neutral port and sold there under the decree of a prize court, subject to objection on the part of the neutral Government. The sentence of a prize court is, where the jurisdiction is well-founded, a judgment *in rem* and entitled to universal respect. In the British dominions the prize courts are such courts as the crown or parliament invests with authority in prize matters. In practice these are the High Court of Justice (Admiralty Division) and the Vice-Admiralty Courts abroad. By the Naval Prize Act, 1864, the High Court of Admiralty of England (now represented by the Admiralty Division) has jurisdiction as a prize court throughout the British dominions. It is to be noticed that this jurisdiction is entirely derivative; the court has no original prize jurisdiction as it has original instance jurisdiction. The prize jurisdiction of Scotch courts was vested in the High Court of Admiralty of England by 6 Geo. IV. c. 120, § 57. In the United States (in accordance with Art. III. § 2 of the constitution, "The judicial power shall extend to . . . all cases of admiralty and maritime jurisdiction") the prize courts are the district courts, the State courts having no jurisdiction. The procedure of a prize court is simple in its character. In Great Britain and the United States standing interrogatories are administered to the captors. The case is heard upon the depositions of the witnesses in answer to the interrogatories, and upon the ship's papers, which it is the duty of the captor to forward to a port of his country for deposit in the court. The flag is regarded as *prima facie* evidence of the nationality of a captured vessel. The pleadings are not technical. A libel is filed, followed by a monition to parties interested. If the cause be not prosecuted, the court will issue a monition to the captors to proceed. A prize court has power to order matters incidental to the cause, such as unlivery and appraisement and sale. It also distributes prize money in some cases (see below). The procedure of prize courts in the British dominions may be regulated by order in council under the powers of the Naval Prize Act, 1864; in the United States it depends upon the Prize Act of June 30, 1864. An appeal lies in England from the Admiralty Division to the Court of Appeal and thence to the House of Lords, from the Vice-Admiralty Courts abroad to the Judicial Committee of the Privy Council. In the United States it lies to the supreme court where the matter in dispute exceeds 2000 dollars, or involves a question of general importance. In addition to prize proper, prize courts have had jurisdiction in some analogous matters conferred on them by statute. Thus a prize court in the British dominions has jurisdiction over (1) enemy's property captured in a conjoint expedition of land and naval forces, 2 and 3 Will. IV. c. 53, § 30, or captured on land by a naval or naval and military force acting either alone or with allied forces, 27 & 28 Vict. c. 25, §§ 34, 35; (2) petitions of right where the subject-matter of a petition arises out of the exercise of any belligerent right by the crown, or would be cognizable in a prize court if the same were a matter in dispute between private persons, § 52. Questions of booty of war may be referred to the Admiralty Division as a prize court, 3 & 4 Vict. c. 65, § 22. The United States prize courts have by the Act of 1854 jurisdiction over property captured in an insurrection.¹

Prize Money.—The term prize money is used in a wider sense than the term prize. It extends to any reward granted by the state for the capture of enemy's property whether by land or sea. (1) The Act consolidating the right to and distribution of army prize money is the Army Prize Act, 1832, 2 & 3 Will. IV. c. 53. The right and interest of troops to prize money and bounty money is at the discretion of the crown, and is to be distributed in such proportions as the crown may direct. It is to be noticed that capture by

troops of an enemy's ship in a road, river, haven, or creek of the enemy gives a right to prize money in this sense, though it is not prize proper, not having been captured at sea by an armed ship. Deserters are not entitled to prize money. Shares not claimed within six years are forfeited. A list of persons entitled is transmitted to Chelsea Hospital, the treasurer of which distributes the money either to such persons or their assignees, or to the regimental agent, according to the rules laid down in the Act. Prize money may be assigned subject to certain conditions. In the case of officers the assignment must express the consideration money actually paid for the assignment; in the case of non-commissioned officers or seamen the assignment is only valid where there is no regimental agent. In conjoint expeditions of land and naval forces, the share of the land forces is to be paid to the treasurer of Chelsea Hospital. By 27 & 28 Vict. c. 36, § 3, prize money not exceeding £50 may be paid without probate or letters of administration. By 39 Vict. c. 14, the accounts are to be laid before parliament. In the United States provision was made by several Acts of Congress that officers and soldiers who had served in certain wars should be entitled to warrants for bounty-lands as a reward for their services. (2) For the right to prize money where the captor at sea is not a public ship of war, see *PRIVATEER*. Where the captor is a public ship of war of Great Britain, the officers and crew have only such interest in the proceeds of prize as the crown may from time to time grant them. This interest is subject to forfeiture for misconduct in relation to the prize, 27 & 28 Vict. c. 25, §§ 36, 55. In the United States, by the Prize Act of 1864, the whole proceeds go to the captor where the prize is of superior or equal force, one-half to the captor and one-half to the United States where the prize is of inferior force. The prize money accruing to the United States forms part of the fund for pensions. Besides a share of the prize, prize bounty is generally given. By the Naval Prize Act, 1864, this is at the rate of £5 for each person on board the enemy's ship, if a ship of war, 27 & 28 Vict. c. 25, § 42. By the United States Act of 1864 the rate is \$00 dollars if the prize is of superior or equal force, 100 if of inferior force. The distribution of prize money and prize bounty in Great Britain is regulated by the Naval Agency and Distribution Act, 1864, 27 & 28 Vict. c. 24. The money is distributed under the direction of the lords of the Admiralty in the proportions specified in a royal proclamation or order in council. The proportions are graduated according to rank (see vol. xvii. p. 307). Assignment of a share by a petty officer or seaman or a non-commissioned officer of marines or marine is void unless in accordance with orders in council. All forfeited and unclaimed shares, and a percentage of 5 per cent. out of the proceeds and grants, are carried to the account of the naval prize cash balance. The Admiralty Division has the sole right of determining disputes as to distribution or investment. In the United States the distribution is regulated by the Act of 1864. The distribution is by the district court; it is a judicial act, not, as in Great Britain, the act of a Government department. The proportions too are fixed by statute—not left, as in Great Britain, to the discretion of the executive. The commanding officer of a fleet or squadron has one-twentieth allotted to him, of a division one-fiftieth, a fleet captain one-hundredth, the commander of a single vessel one-tenth of the amount awarded to the vessel; the residue share in proportion to their pay. Prize money is paid into the treasury of the United States to be distributed according to the decree of the court. Ransom money, salvage, bounty, and proceeds of condemned property are distributable as prize money. Assignments of prize money must be attested by the commanding officer and the paymaster. There are certain cases where money is granted to the officers and crew of vessels making captures which are not prize in the strict sense of the word. Under this head may be classed the salvage on recapture already mentioned, besides the cases provided for in the following enactments. By 22 & 23 Car. II. c. 11, § 10, 2 per cent. of the value of the ship defended may be awarded to those wounded and the representatives of those slain in the defense of a merchant ship against pirates. By the Customs Act, 1876, 39 & 40 Vict. c. 36, §§ 210-216, rewards may be granted to officers of the customs out of the penalties for goods seized. By the Slave Trade Act, 1873, 36 & 37 Vict. c. 88, §§ 11, 12, a bounty of £5 [\$24.30] per slave or of £4 [\$19.44] per ton is payable to the officers and crew of one of Her Majesty's ships upon capture of a slave ship. Where the capture is not by a ship of war, the bounty is one-third of the value of the ship seized, and a bounty of £5 [\$24.30] for each slave. By an Act of Congress of March 3, 1819, a bounty of 25 dollars is given for each slave captured, and the proceeds of condemned slave ships are divided between the United States and the captors, half to each.

(J. Wt.)

PROBABILITY.

THE mathematical theory of probability is a science which aims at reducing to calculation, where possible, the amount of credence due to propositions or statements, or to the occurrence of events, future or past, more especially as contingent or dependent upon other propositions or events the probability of which is known.

Any statement or (supposed) fact commands a certain amount of credence, varying from zero, which means conviction of its falsity, to absolute certainty, denoted by unity. An even chance, or the probability of an event which is as likely as not to happen, is represented by the fraction $\frac{1}{2}$. It is to be observed that $\frac{1}{2}$ will be the probability of an event about which we have no knowledge whatever, because if we can see that it is more likely to happen than not, or less likely than not, we must be in possession of some information respecting it. It has been proposed to form a sort of thermometrical scale, to which to refer the strength of the conviction we have in any given case. Thus if the twenty-six letters of the alphabet have been shaken together in a bag, and one letter be drawn, we feel a very feeble expectation that A has been the one taken. If two letters be drawn, we have still very little confidence that A is one of them; if three be drawn, it is somewhat stronger; and so on, till at last, if twenty-six be drawn, we are certain of the event, that is, of A having been taken.

Probability, which necessarily implies uncertainty, is a consequence of our ignorance. To an omniscient Being there can be none. Why, for instance, if we throw up a shilling, are we uncertain whether it will turn up head or tail? Because the shilling passes, in the interval, through a series of states which our knowledge is unable to predict or to follow. If we knew the exact position and state of motion of the coin as it leaves our hand, the exact value of the final impulse it receives, the laws of its motion as affected by the resistance of the air and gravity, and finally the nature of the ground at the exact spot where it falls, and the laws regulating the collision between the two substances, we could predict as certainly the result of the toss as we can which letter of the alphabet will be drawn after twenty-five have been taken and examined.

The probability, or amount of conviction accorded to any fact or statement, is thus essentially subjective and varies with the degree of knowledge of the mind to which the fact is presented (it is often indeed also influenced by passion and prejudice, which act powerfully in warping the judgment),—so that, as Laplace observes, it is affected partly by our ignorance partly by our knowledge. Thus, if the question were put, Is lead heavier than silver? some persons would think it is, but would not be surprised if they were wrong; others would say it is lighter; while to a worker in metals probability would be superseded by certainty. Again, to take Laplace's illustration, there are three urns A, B, C, one of which contains black balls, the other two white balls; a ball is drawn from the urn C, and we want to know the probability that it shall be black. If we do not know which of the urns contains the black balls, there is only one favorable chance out of three, and the probability is said to be $\frac{1}{3}$. But if a person knows that the urn A contains white balls, to him the uncertainty is confined to the urns B and C, and therefore the probability of the same event is $\frac{1}{2}$. Finally to one who had found that A and B both contained white balls, the probability is converted into certainty.

In common language, an event is usually said to be likely or probable if it is more likely to happen than not, or when, in mathematical language, its probability exceeds $\frac{1}{2}$; and it is said to be improbable or unlikely when its probability is less than $\frac{1}{2}$. Not that

this sense is always adhered to; for, in such a phrase as "It is likely to thunder to-day," we do not mean that it is more likely than not, but that in our opinion the chance of thunder is greater than usual; again, "Such a horse is likely to win the Derby," simply means that he has the best chance, though according to the betting that chance may be only $\frac{1}{2}$. Such unsteady and elliptical employment of words has of course to be abandoned and replaced by strict definition, at least mentally, when they are made the subjects of mathematical analysis. *Certainty*, or absolute conviction, also, as generally understood, is different from the mathematical sense of the word certainty. It is very difficult and often impossible, as is pointed out in the celebrated *Grammar of Assent*, to draw out the grounds on which the human mind in each case yields that conviction, or assent, which according to Newman, admits of no degrees, and either is entire or is not at all.¹ If, when walking on the beach, we find the letters "Constantinople" traced on the sand, we should feel, not a strong impression, but absolute certainty, that they were characters not drawn at random, but by one acquainted with the word so spelt. Again, we are certain of our own death, as a future event; we are certain, too, that Great Britain is an island; yet in all such cases it would be very difficult, even for a practiced intellect, to present in logical form the evidence, which nevertheless has compelled the mind in each instance to concede the point. Mathematical certainty, which means that the contrary proposition is inconceivable, is thus different, though not perhaps as regards the force of the mental conviction, from moral or practical certainty. It is questionable whether the former kind of certainty is not entirely hypothetical, and whether it is ever attainable in any of the affairs or events of the real world around us. The truth of no conclusion can rise above that of the premises, of no theorem above that of the data. That two and two make four is an incontrovertible truth; but before applying even it to a concrete instance we have to be assured that there were really two in each constituent group; and we can hardly have mathematical certainty of this, as the strange freaks of memory, the tricks of conjurors, etc., have often made apparent.

There is no more remarkable feature in the mathematical theory of probability than the manner in which it has been found to harmonize with, and justify, the conclusions to which mankind have been led, not by reasoning, but by instinct and experience, both of the individual and of the race. At the same time it has corrected, extended, and invested them with a definiteness and precision of which these crude, though sound, appreciations of common sense were till then devoid. Even in cases where the theoretical result appears to differ from the common-sense view, it often happens that the latter may, though perhaps unknown to the mind itself, have taken account of circumstances in the case omitted in the data of the theoretical problem. Thus, it may be that a person accords a lower degree of credence to a fact attested by two or more independent witnesses than theory warrants,—the reason being that he has unconsciously recognized the possibility of collusion, which had not been presented among the data. Again, it appears from the rules for the credibility of testimony that the probability of a fact may be *diminished* by being attested by a new witness, viz., in the case where his credibility is less than $\frac{1}{2}$. This is certainly at variance with our natural impression, which

¹ "There is a sort of leap which most men make from a high probability to absolute assurance . . . analogous to the sudden consilience, or springing into one, of the two images seen by binocular vision, when gradually brought within a certain proximity."—Sir J. Herschel, in *Edin. Review*, July, 1850.

² Archbishop Whately's *Jeu d'esprit*, *Historic Doubts respecting Napoleon Bonaparte*, is a good illustration of the difficulties there may be in proving a conclusion the certainty of which is absolute.

is that our previous conviction of any fact is clearly not weakened, however little it be intensified, by any fresh evidence, however suspicious, as to its truth. But on reflection we see that it is a practical absurdity to suppose the credibility of any witness less than $\frac{1}{2}$ —that is, that he speaks falsehood oftener than truth—for all men tell the truth probably nine times out of ten, and only deviate from it when their passions or interests are concerned. Even where his interests are at stake, no man has any preference for a lie, as such, above the truth; so that his testimony to a fact will at worst leave the antecedent probability exactly what it was.

A celebrated instance of the confirmation and completion by theory of the ordinary view is afforded by what is known as James Bernoulli's theorem. If we know the odds in favor of an event to be three to two, as for instance that of drawing a white ball from a bag containing three white and two black, we should certainly judge that if we make five trials we are more likely to draw white three times and black twice than any other combination. Still, however, we should feel that this was very uncertain; instead of three white, we might draw white 0, 1, 2, 4, or 5 times. But if we make say one thousand trials, we should feel confident that, although the numbers of white and black might not be in the proportion of three to two, they would be very nearly in that proportion. And the more the trials are multiplied the more closely would this proportion be found to obtain. This is the principle upon which we are continually judging of the possibility of events from what is observed in a certain number of cases.¹ Thus if, out of ten particular infants, six are found to live to the age of twenty, we judge, but with a very low amount of conviction, that nearly six-tenths of the whole number born live to twenty. But if, out of 1,000,000 cases, we find that 600,000 live to be twenty, we should feel certain that the same proportion would be found to hold almost exactly were it possible to test the whole number of cases, say in England during the 19th century. In fact we may say, considering how seldom we know *a priori* the probability of any event, that the knowledge we have of such probability in any case is entirely derived from this principle, viz., that the proportion which holds in a large number of trials will be found to hold in the total number, even when this may be infinite,—the deviation or error being less and less as the trials are multiplied.

Such no doubt is the verdict of the common sense of mankind, and it is not easy to say upon what considerations it is based, if it be not the effect of the unconscious habit which all men acquire of weighing chances and probabilities, in the state of ignorance and uncertainty in which human life is. It is now extremely interesting to see the results of the unerring methods of mathematical analysis when applied to the same problem. It is a very difficult one, and James Bernoulli tells us he reflected upon it for twenty years. His methods, extended by De Moivre and Laplace, fully confirm the conclusions of rough common sense; but they have done much more. They enable us to estimate exactly how far we can rely on the proportion of cases in a large number of trials, truly representing the proportion out of the total number—that is, the real probability of the event. Thus he proves that if, as in the case above mentioned, the real probability of an event is $\frac{3}{5}$, the odds are 1000 to 1 that, in 25,550 trials, the event shall occur not more than 15,841 times and not less than 14,819 times,—that is, that the deviation from 15,330, or $\frac{3}{5}$ of the whole, shall not exceed $\frac{1}{10}$ of the whole number of trials.

¹ So it is said, "the tree is known by its fruits"; "practice is better than theory"; and the universal sense of mankind judges that the safest test of any new invention, system, or institution is to see how it works. So little are we able by *a priori* speculations to forecast the thousand obstacles and disturbing influences which manifest themselves when any new cause or agent is introduced as a factor in the world's affairs.

The history of the theory of probability, from the celebrated question as to the equitable division of the stakes between two players on their game being interrupted, proposed to Pascal by the Chevalier de Méré in 1654, embracing, as it does, contributions from almost all the great names of Europe during the period, down to Laplace and Poisson, is elaborately and admirably given by Mr. Todhunter in his *History* of the subject, now a classical work. It was not indeed to be anticipated that a new science which took its rise in games of chance, and which had long to encounter an obloquy, hardly yet extinct, due to the prevailing idea that its only end was to facilitate and encourage the calculations of gamblers, could ever have attained its present status—that its aid should be called for in every department of natural science, both to assist in discovery, which it has repeatedly done (even in pure mathematics), to minimize the unavoidable errors of observation, and to detect the presence of causes as revealed by observed events. Nor are commercial and other practical interests of life less indebted to it:² wherever the future has to be forecasted, risk to be provided against, or the true lessons to be deduced from statistics, it corrects for us the rough conjectures of common sense, and decides which course is really, according to the lights of which we are in possession, the wisest for us to pursue. It is *sui generis* and unique as an application of mathematics, the only one, apparently, lying quite outside the field of physical science. De Moivre has remarked that, "some of the problems about chance having a great appearance of simplicity, the mind is easily drawn into a belief that their solution may be attained by the mere strength of natural good sense"; and it is with surprise we find that they involve in many cases the most subtle and difficult mathematical questions. It has been found to tax to the utmost the resources of analysis and the powers of invention of those who have had to deal with the new cases and combinations which it has presented. Great, however, as are the strictly mathematical difficulties, they cannot be said to be the principal. Especially in the practical applications, to detach the problem from its surroundings in *rerum natura*, discarding what is non-essential, rightly to estimate the extent of our knowledge respecting it, neither tacitly assuming as known what is not known, nor tacitly overlooking some datum, perhaps from its very obviousness, to make sure that events we are taking as independent are not really connected, or probably so,—such are the preliminaries necessary before the question is put in the scientific form to which calculation can be applied, and failing which the result of the mathematician will be but an *ignoratio elenchi*—a correct answer, but to a different question.

From its earliest beginnings, a notable feature in our subject has been the strange and insidious manner in which errors creep in—often misleading the most acute minds, as in the case of D'Alembert—and the difficulty of detecting them, even when one is assured of their presence by the evident incorrectness of the result. This is probably in many cases occasioned by the poverty of language obliging us to use one term in the same context for different things—thus introducing the fallacy of ambiguous middle; e. g., the same word "probability" referring to the same event may sometimes mean its probability *before* a certain occurrence, sometimes *after*; thus the chance of a horse winning the Derby is different after the Two Thousand from what it was before. Again, it may

² Men were surprised to hear that not only births, deaths, and marriages, but the decisions of tribunals, the results of popular elections, the influence of punishments in checking crime, the comparative values of medical remedies, the probable limits of error in numerical results in every department of physical inquiry, the detection of causes, physical, social and moral, nay, even the weight of evidence and the validity of logical argument, might come to be surveyed with the lynx-eyed scrutiny of a dispassionate analysis.—*Sir J. Herschel*.

mean the probability of the event according to one source of information, as distinguished from its probability taking everything into account; for instance, an astronomer thinks he can notice in a newly-discovered planet a rotation from east to west; the probability that this is the case is of course that of his observations in like cases turning out correct, if we had no other source of information; but the actual probability is less, because we know that at least the vast majority of the planets and satellites revolve from west to east. It is easy to see that such employment of terms in the same context must prove a fruitful source of fallacies, and yet, without wearisome repetitions, it cannot always be avoided. But, apart from mere logical errors, the main stumbling-block is no doubt the uncertainty as to the limits of our knowledge in each case, or—though this may seem a contradiction in terms—the difficulty of knowing what we do know; and we certainly err as often in forgetting or ignoring what we do know, as in assuming what we do not. It is a not uncommon popular delusion to suppose that if a coin has turned up head, say five times running, or the red has won five times at roulette, the same event is likely to occur a sixth time; and it arises from overlooking (perhaps from the imagination being struck by the singularity of the occurrence) the *a priori* knowledge we possess, that the chance at any trial is an even one (supposing all perfectly fair); the mind thus unconsciously regards the event simply as one that has recurred five times, and therefore judges, correctly, that it is very likely to occur once more. Thus if we are given a bag containing a number of balls, and we proceed to draw them one by one, and the first five drawn are white, the odds are 6 to 1 that the next will be white—the slight information afforded by the five trials being thus of great importance and strongly influencing the probabilities of the future, when it is all we have to guide us, but absolutely valueless and without influence on the future when we have *a priori* certain information. The lightest air will move a ship which is adrift, but has simply no effect on one securely moored.

It is not to be supposed that the results arrived at when the calculus of probabilities is applied to most practical questions are anything more than approximations; but the same may be said of almost all such applications of abstract science. Partly from ignorance of the real state of the case, partly from the extreme intricacy of the calculations requisite if all the conditions which we do or might know are introduced, we are obliged to substitute in fact, for the actual problem, a simpler one approximately representing it. Thus, in mechanical questions, assumptions such as that the centre of gravity of an actual sphere is at its centre, that the friction of the rails on a railway is constant at different spots or at different times, or that in the rolling of a heavy body no depression is produced by its weight in the supporting substance, are instances of the convenient fictions which simplify the real question, while they prevent us accepting the result as more than something near the truth. So in probability, the chance of life of an individual is taken from the general tables (unless reasons to the contrary are very palpable), although, if his past history, his mode of life, the longevity of his family, etc., were duly weighed, the general value ought to be modified in his case; again, in attempting to estimate the value of the verdict of a jury, whether unanimous or by a majority, each man is supposed to give his honest opinion—feeling and prejudice, or pressure from his fellow-jurors, being left out of the account. Again, the value of an *expectation* to an individual is taken to be measured by the sum divided by his present fortune, though it is clearly affected by other circumstances, as the number of his family, the nature of his business, etc. An event has been found to occur on an average once a year during a long period; it is not difficult to show that the chance of its happening in a particular year is $1 - e^{-1}$, or 2 to 1 nearly.

But, on examining the record, we observe it has never failed to occur during three years running. This fact increases the above chance, but to introduce it into the calculation at once renders the question a very difficult one. Even in games of chance we are obliged to judge of the relative skill of two players by the result of a few games; now one may not have been in his usual health, etc., or may have designedly not played his best; when he did win he may have done so by superior play, or rather by good luck; again, even in so simple a case as pitch and toss, the coin may, in the concrete, not be quite symmetrical, and the odds of head or tail not quite even.

Not much has been added to our subject since the close of Laplace's career. The history of science records more than one parallel to this abatement of activity. When such a genius has departed, the field of his labors seems exhausted for the time and little left to be gleaned by his successors. It is to be regretted that so little remains to us of the inner working of such gifted minds and of the clue by which each of their discoveries was reached. The didactic and synthetic form in which these are presented to the world retains but faint traces of the skilful inductions, the keen and delicate perception of fitness and analogy, and the power of imagination—though such a term may possibly excite a smile when applied to such *dry* subjects—which have doubtless guided such a master as Laplace or Newton in shaping out each great design—only the minor details of which have remained over, to be supplied by the less cunning hand of commentator and disciple.

We proceed to enumerate the principal divisions of the theory of probability and its applications. Under each we will endeavor to give at least one or two of the more remarkable and suggestive questions which belong to it—especially such as admit of simplification or improvement in the received solutions; in such an article as the present we are debarred from attempting even an outline of the whole. We will suppose the general fundamental principles to be already known to the reader, as they are to be now found in several elementary works, such as Todhunter's *Algebra*, Whitworth's *Choice and Chance*, etc.

Many of the most important results are given under the apparently trifling form of the chances in drawing balls from an urn, etc., or seem to relate to games of chance, as dice or cards, but are in reality of far wider application—this form being adopted as the most definite and lucid manner of presenting the chances of events occurring under circumstances which may be assimilated, more or less closely, to such cases.

I. DETERMINATION OF THE PROBABILITIES OF COMPOUND EVENTS, WHEN THE PROBABILITIES OF THE SIMPLE EVENTS ON WHICH THEY DEPEND ARE KNOWN.

1. Under this head come a very large and diversified range of questions; a very few of the most important are all that we can give. One great class relates to the fulfilment of given conditions in repeated trials as to the same event, knowing the probability of what will happen in each trial.

2. Let there be an event which must turn out in one of two ways, W and B (as in drawing a ball from an urn containing white and black balls only); let the respective probabilities for each trial be p, q ; so that $p + q = 1$. Let two trials be made: the four possible cases which may arise are

WW, WB, BW, BB.

The probability of the first is p^2 , of the second pq , of the third pq , of the fourth q^2 . Thus the probability of a white and a black ball being drawn in an assigned order is pq ; but that of a white and a black in any order is $2pq$.

Suppose now n trials to be made. The probability of W every time is p^n ; that of B once and W $(n-1)$ times in an assigned order is $p^{n-1}q$, but if the order is indifferent it is $np^{n-1}q$; that of B occurring twice only is $p^{n-2}q^2$ if the order is given, but $\frac{n(n-1)}{2}p^{n-2}q^2$ in any order; and so on. We have then this result: in the binominal expansion

$$(p+q)^n = 1 = p^n + np^{n-1}q + \frac{n(n-1)}{2}p^{n-2}q^2 + \frac{n(n-1)(n-2)}{3}p^{n-3}q^3 + \dots \quad (1),$$

the terms in their order give the probabilities of the event W happening n times; of W ($n-1$) times and B once; of W ($n-2$) times and B twice; and so on,—the sum of the whole giving 1, that is, certainty.

3. As an example, let A and B be two players whose respective chances of winning one game are p and q ; to find the probability of A winning m games before B wins n games, the play terminating when either of these events has occurred.

The chance of A winning the first m games is p^m . The chance of his winning in the first $m+1$ games is $mp^{m-1}q$. $p = mp^mq$; for he must have won $m-1$ games out of the first m , and then win the ($m+1$)th; otherwise we should be including the first case. Again, the chance of A winning in the first $m+2$ games is, in like manner, $\frac{(m+1)m}{2}p^{m-2}q^2$; and so on. Now the match must be decided

at latest by the ($m+n-1$)th game; for, if A fails to win m games by that time, B must have won n . Hence the chance of A winning the match is

$$p^m \left\{ 1 + mq + \frac{m(m+1)}{2}q^2 + \dots + \frac{m(m+1) \dots (m+n-2)}{(n-1)!}q^{n-1} \right\}.$$

Thus, if A 's skill be double that of B , the chance that A wins four games before B wins two is $\frac{112}{243}$. That of B win-

ing is $\frac{131}{243}$.

If A and B agree to leave off playing before the match is decided, the stakes ought clearly to be divided between them in proportion to their respective probabilities of winning, as given above,—putting for m and n the numbers of games required to be won, at any given point of the match, by A and B respectively.

This was one of the questions proposed to Pascal by the Chevalier de Méré in the year 1654.

4. In the expansion (1) it may be asked which combination of the events W , B is most likely to occur in the n trials. As the ratio of the 2d term to the 1st is $\frac{n-1}{p}$, of the

3d to the 2d $\frac{n-2}{p}$, and of the ($r+1$)th to the r th

$\frac{n-r+1}{r}$, so long as this ratio continues to increase the terms will increase. The condition, therefore, for the r th term to be the greatest is

$$\frac{n-r+1}{r} < \frac{p}{q}; \text{ or } r > (n+1)q;$$

that is, r is the next integer above $(n+1)q$.

We conclude that if r is the next integer below $(n+1)q$ the ($r+1$)th term is the greatest—that is, it is most likely that the event W occurs $n-r$ times and B r times. If $(n+1)q$ should be an integer (r), B is as likely to occur ras $r+1$ times; and either is more probable than any other number. Thus in twelve throws of a die, the ace is more likely to turn up twice than any other number; while in eleven throws it is as likely to turn up once only as twice.

It is important to remark that, if the number of trials n be very large, we may treat qn and pn as whole numbers, and conclude that the event W is more likely to happen pn times and B qn times than in any other proportion.

5. Among the many questions which relate to the occurrence of different combinations in successive trials as to the same event, one is as to the chances for a succession, or run, of the same result several times.

Let us consider the very simple case—In n throws of a coin, what is the chance that head occurs (at least) twice running?

This will be an instance of the aid afforded by the calculus of finite differences in questions on probability. Let u_r = the number of cases of r throws of a coin in which head turns up twice running, the whole number of cases being of course 2^r . Now if we consider the value of u_{n+3} , it includes $2u_{n+2}$, because the ($n+3$)th throw may turn up two ways; but it includes also those cases when head turns up in the last two throws, tail in the preceding one, and no run of two heads occurs in the n preceding ones. The number of these cases is $2^n - u_n$. We have therefore the equation

$$u_{n+3} = 2u_{n+2} + 2^n - u_n \dots \dots (2).$$

If E be an operator such that $Eu_r = u_{r+1}$, equation (2) is

$$(E^3 - 2E^2 + 1)u_n = 2^n;$$

or, $(E-1)(E^2 - E - 1)u_n = 2^n$;

so that, if we put α, β for the roots of the equation $E^2 - E - 1 = 0$,

$$u_n = 2^n + A + B\alpha^n + C\beta^n \dots \dots (3),$$

since $u_n = 2^n$ is a particular solution of (2),— A, B, C being three undetermined constants.

Now in two throws there is one case where head turns up twice, and in three throws there are three cases; hence we have

$$\begin{aligned} u_1 &= 0 = 2 + A + B\alpha + C\beta \\ u_2 &= 1 = 4 + A + B\alpha^2 + C\beta^2 \\ u_3 &= 3 = 8 + A + B\alpha^3 + C\beta^3; \end{aligned}$$

and, remembering that $\alpha^2 = \alpha + 1$, $\beta^2 = \beta + 1$, we shall easily find from these

$$A = 0, B = \frac{\alpha^2}{\beta - \alpha}, C = \frac{\beta^2}{\alpha - \beta};$$

so that

$$u_n = 2^n - \frac{\alpha^{n+2} - \beta^{n+2}}{\alpha - \beta} \dots \dots (4).$$

Now

$$\alpha = \frac{1+\sqrt{5}}{2}, \beta = \frac{1-\sqrt{5}}{2};$$

expanding by the binomial theorem and reducing,

$$u_n = 2^n - \frac{n+2}{2^{n+1}} \left\{ 1 + \frac{(n+1)n}{3}5 + \frac{(n+1)n(n-1)(n-2)}{5}5^2 + \dots \right\} \dots (5);$$

dividing by the total number of cases 2^n , we have for the probability of head turning up at least twice running in n throws

$$p_n = 1 - \frac{n+2}{2^{n+1}} \left\{ 1 + \frac{(n+1)n}{3}5 + \frac{(n+1)n(n-1)(n-2)}{5}5^2 + \dots \right\} \dots (6).$$

Another method of obtaining the same result is to consider the number of cases in which head never occurs twice running; let u_n be this number, then $2^n - u_n$ must be the number of cases when head occurs at least twice successively. Consider the value of u_{n+2} ; if the last or ($n+2$)th throw be tail, u_{n+2} includes all the cases (u_{n+1}) of the $n+1$ preceding throws which gave no succession of heads; and if the last be head the last but one must be tail, and these two may be preceded by any one of the u_n favorable cases for the first n throws. Consequently

$$u_{n+2} = u_{n+1} + u_n.$$

If α, β , as before are the roots of the quadratic $E^2 - E - 1 = 0$, this equation gives

$$u_n = A\alpha^n + B\beta^n.$$

Here A and B are easily found from the conditions $u_1 = 2$, $u_2 = 3$; viz.,

$$A = \frac{\alpha^2}{\alpha - \beta}, B = \frac{\beta^2}{\beta - \alpha},$$

whence $u_n = \frac{n+2}{2^{n+1}} \left\{ 1 + \frac{(n+1)n}{1.2.3}5 + \text{etc.} \right\}$

as in eq. (5). The probability that head never turns up twice running is found by dividing this by 2^n , the whole number of cases. This probability of course becomes smaller and smaller as the number of trials (n) is increased.

6. Let us consider the chance of a run of three heads or tails during n throws,—that of a run of two heads or tails being evidently $\frac{2^n - 2}{2^n} = 1 - \frac{1}{2^{n-1}}$, as there are but two

cases out of the 2^n which are alternately head and tail.

Let u_r be the number of cases, during r throws, which give at least one succession of three heads or three tails. Consider the value of u_{n+3} ; it includes $2u_{n+2}$, as the last throw may be head or tail; but, besides these, every case of the first n throws which contains no run of three gives rise to one new case of the $n+3$ having a run of three; thus, if the n th throw be head, the last four may be H T T T, or T H H H if the n th be tail. Hence

$$u_{n+3} = 2u_{n+2} + 2^n - u_n,$$

the same equation of differences as (2). Its solution is equation (3), in which, if we determine the constants by the conditions $u_1 = 0$, $u_2 = 0$, $u_3 = 2$, and divide by 2^n , we find for the probability of a run of three of either event during n trials

$$\frac{u_n}{2^n} = 1 - \frac{n+1}{2^{n-1}} \left\{ 1 + \frac{n(n-1)}{3}5 + \frac{n(n-1)(n-2)(n-3)}{5}5^2 + \dots \right\} \dots (7).$$

Comparing this result with (6) we find that the chance of a run of two heads in n trials is equal to the chance of a run of three, of either heads or tails, in $n+1$ trials.

7. If an event may turn out on each trial in $a+b$ ways, of which a are favorable and b unfavorable (thus a card may be drawn from a pack in fifty-two ways, twelve of which give court cards), and if we consider the probability that during n trials there shall occur a run of at least p favorable results, it is not difficult to see that (u_r denoting the number of ways this may occur in r trials)

$$u_{n+p+1} = (a+b)u_{n+p} + ba^p \{ (a+b)^n - u_n \},$$

as u_{n+p+1} includes, besides $(a+b)u_{n+p}$, those cases in which the last p trials are favorable, the one before unfavorable, and the n preceding containing no such run as stated.

We will not enter on Laplace's solution of this equation, or rather of one equivalent to it, especially as the result is not a simple one (see Todhunter, p. 185).

8. Let the probability of an event happening in one trial be p , that of its failing q ; we have seen (art. 4) that, if a large number N of trials be made, the event is most likely to happen pN times and fail qN times. The chance of this occurring, is however, extremely small, though greater than that in favor of any other proportion. We propose now to examine the probability that the proportion of successes shall not deviate from its most probable value by more than a given limit—that is, in fact, to find the probability that in N trials the number of times in which the event happens shall lie between the two limits $pN \pm r$.

Let $m = pN$, $n = qN$, which are taken to be integers. The probability of the event happening m times is the greatest term T of the expansion (1), viz.,

$$T = \frac{N!}{m!n!} p^m q^n.$$

The calculation of this would be impracticable when N , m , n are large numbers, but Stirling's theorem gives us

$$1.2.3 \dots x = x^x e^{-x} \sqrt{2\pi x},$$

very nearly when x is large; and by substituting in the preceding value of T , and reducing, we easily find

$$T = \frac{1}{\sqrt{2\pi pqN}} \dots \dots \dots (8).$$

Now the terms of the expansion (1) on either side of T are

$$\dots \dots \frac{n(n-1)}{(m+1)(m+2)} \frac{p^2}{q^2} T + \frac{n}{m+1} \frac{p}{q} T + T + \frac{m}{n+1} \frac{q}{p} T + \dots \dots \dots (9).$$

But if x is much greater than a ,

$$x-a = xe^{-\frac{a}{x}} \text{ nearly,}$$

so that

$$n(n-1)(n-2) \dots (s \text{ terms}) = n^s e^{-\frac{1+2+\dots(s-1)}{n}} = n^s e^{-\frac{s(s-1)}{2n}};$$

$$\text{also } (m+1)(m+2) \dots (s \text{ terms}) = m^s e^{\frac{s(s+1)}{2m}}.$$

Hence the s th term before T in (9) is

$$\left(\frac{n}{m} \right)^s e^{-\frac{s(s-1)}{2n}} e^{-\frac{s(s+1)}{2m}} \left(\frac{p}{q} \right)^s T, \text{ or } e^{-\frac{Ns^2}{2mn}} + \frac{m-n}{2mn} s T.$$

The s th term after T is

$$e^{-\frac{Ns^2}{2mn}} - \frac{m-n}{2mn} s T.$$

Now the probability that the event shall happen a number of times comprised between $m+r$ and $m-r$ is the sum of the terms in (9) from the r th term before T to the r th term after T . (N , B , though r may be large, it is supposed small as compared with N , m , or n .)

Now the s th term before T + the s th term after T =

$$2e^{-\frac{Ns^2}{2mn}} T, \text{ since } e^x + e^{-x} = 2, \text{ when } x = \frac{m-n}{2mn} s \text{ is small.}$$

Taking then each term before T with the corresponding term after T , and putting for shortness

$$a^2 = \frac{N}{2mn} = \frac{1}{2pqN} \dots \dots \dots (10).$$

we have for the required probability

$$p_r = 2 \left\{ \frac{1}{2} T + T e^{-a^2} + T e^{-2a^2} + T e^{-3a^2} + \dots T e^{-ra^2} \right\}.$$

If we now consider the curve whose equation is

$$y = T e^{-x^2},$$

and take a series of its ordinates corresponding to $x=0, a,$

$2a, 3a \dots ra$, where a is very small, and if A be its area from $x=0$ to $x=ra$, then

$$\frac{A}{a} = \frac{1}{2} (\text{first} + \text{last ordinates}) + \text{sum of intermediate}$$

$$\text{ordinates} \dots p_r = \frac{2}{a} A + \text{last ordinate,}$$

$$= \frac{2}{a} T \int_0^{ra} e^{-x^2} dx + T e^{-r^2 a^2}$$

$$\text{or } p_r = \frac{2}{\sqrt{\pi}} \int_0^{ra} e^{-x^2} dx + \frac{1}{\sqrt{2pqN\pi}} e^{-r^2 a^2} \dots (11).$$

9. We refer to the integral calculus for the methods of computing the celebrated integral $\int e^{-x^2} dx$, and will give here a short table of its values.

Table of the Values of the Integral $I = \frac{2}{\sqrt{\pi}} \int_0^x e^{-x^2} dx$.

τ	I	τ	I	τ	I	τ	I
0.00	0.00000	.2	.22270	1.3	.93401	2.4	.99931

.1	.11246	1.2	.91031	2.3	.99886		

If the value of I is 0.5, or $\frac{1}{2}$, $\tau = .4769$.

10. The second term in formula (11) expresses the probability that the number of occurrences of the event shall be exactly $m+r$ or $m-r$, or more correctly the mean of these two probabilities. It may be neglected when the number of trials N is very great and the deviation r not a very small number.

We see from the foregoing table that when

$$ra = \frac{r}{\sqrt{2pqN}} = 3$$

it becomes practically a certainty that the number of occurrences will fall between the limits $m \pm r$.

Thus, suppose a shilling is tossed 200 times in succession;

here $p=q=\frac{1}{2}$ and $a = \frac{1}{\sqrt{2pqN}} = \frac{1}{10}$. If therefore $r=30$, it may be called a certainty that head will turn up more than 70 and less than 130 times.

In the same case suppose we wish to find the limits $m \pm r$ such that it is an even chance that the number of heads shall fall between them, if the second term of (11) be neglected, we see from the table that

$$ra = \frac{1}{10} r = .48, \therefore r = 4.8;$$

so that the probability that the number of heads shall fall between 95 and 105 is

$$p_5 = .52 + \frac{1}{10\sqrt{\pi}} e^{-\frac{1}{4}} = .57 \text{ nearly,}$$

rather more than an even chance.

11. Neglecting the second term of (11), we see that p_r depends solely on the value of ra , or that of $\frac{r}{\sqrt{N}}$; so that, if the number of trials N be increased, the value of r , to give the same probability, increases as the square root of N ; thus, if in N trials it is practically certain (when $ra=3$) that the number of occurrences lies between $pN \pm r$, then, if the number of trials be doubled, it will be certain that the occurrences will lie between $2pN \pm r\sqrt{2}$.

In all cases, if N be given, r can be determined, so that there is a probability amounting to certainty that the ratio of the number of occurrences to the whole number of cases shall lie between the limits

$$p \pm \frac{r}{\sqrt{N}}.$$

Now if N be increased $r \propto \sqrt{N}$; so that these limits are

$$p \pm \frac{C}{\sqrt{N}},$$

C being a constant. Hence it is always possible to increase the number of trials till it becomes a certainty that the proportion of occurrences of the event will differ from p , its probability on

a single trial, by a quantity less than any assignable. This is the celebrated theorem given by James Bernoulli in the *Ars Conjectandi*. (See Todhunter's *History*, p. 71.)

12. We will give here a graphical representation (Fig. 1), taken from M. Quetelet's *Lettres sur la Théorie des Probabilités*, of the facilities of the different numbers of successes which may occur in 1000 trials as to any event which is equally likely to happen as not in each trial—as in 1000 tosses of a coin, or 1000 drawings from an urn containing one white and one black ball, replacing the ball each

"cause" is not here used in its metaphysical sense, but as simply equivalent to "antecedent state of things."

Let us suppose two urns, A containing two white balls, B containing one white and one black ball, and that a person not knowing which is which has drawn a white ball from one, to find the probability that this is the urn A. This is in fact to find, supposing a great number of such drawings to be made, what proportion of them have come from the urn A. If a great number N of drawings are made indiscriminately from both urns, $\frac{1}{2} N$ come from the urn A and are all white, $\frac{1}{2} N$ white come from the urn B, and $\frac{1}{2} N$ black. The drawing actually made is either one of the $\frac{1}{2} N$ white from A, or of the $\frac{1}{2} N$ white from B. As it is equally likely to have been any one of these, the chance that it came from A is $\frac{1}{2} N \div \frac{1}{2} N$, or $\frac{1}{2}$.

Suppose there had been two urns A and three urns B, and a white ball has been drawn from one of the five; as in a great number N of drawings $\frac{2}{5} N$ come from A and are white, $\frac{3}{5} N$ from B and $\frac{1}{5}$ of them are white, the chance that it came from one of the urns A is

$$\frac{2}{5} \div (\frac{2}{5} + \frac{1}{5} \cdot \frac{3}{5}) = \frac{2}{7}.$$

In general suppose an event to have occurred which must have been preceded by one of several causes, and let the antecedent probabilities of the causes be

$$P_1, P_2, P_3 \dots$$

and let p_1 be the probability that when the first cause exists the event will follow, p_2 the same probability when the second cause exists, and so on, to find after the event has occurred, the probabilities of the several causes or hypotheses.

Let a great number N of trials be made; out of these the number in which the first cause exists is $P_1 N$, and out of this number the cases in which the event follows are $p_1 P_1 N$; in like manner the cases in which the second cause exists and the event follows are $p_2 P_2 N$; and so on. As the event has happened, the actual case is one out of the number

$$(p_1 P_1 + p_2 P_2 + p_3 P_3 + \text{etc.}) N,$$

and as the number in which the first cause was present is $p_1 P_1 N$ the *a posteriori* probability of that cause is

$$\pi_1 = \frac{p_1 P_1}{p_1 P_1 + p_2 P_2 + p_3 P_3 + \text{etc.}} \quad (12).$$

So likewise for the other causes,—the sum of these *a posteriori* probabilities being

$$\pi_1 + \pi_2 + \pi_3 + \dots = 1.$$

Supposing the event to have occurred as above, we now see how the probability as to the future, viz., whether the event will happen or fail in a fresh trial, is affected by it. If the first cause exists, the chance that it will happen is p_1 ; hence the chance of its happening from the first cause is $p_1 \pi_1$; so likewise for the second, third, etc. Hence the probability of succeeding on a second trial is

$$p_1 \pi_1 + p_2 \pi_2 + p_3 \pi_3 + \dots \quad (13).$$

14. To give a simple example: suppose an urn to contain three balls which are white or black; one is drawn and found to be white. It is replaced in the urn and a fresh drawing made; find the chance that the ball drawn is white. There are three hypotheses, which are taken to be equally probable *a priori*, viz., the urn contains three white, two white, or one white—that of none white being now impossible. The probability after the event of the first is by (12).

$$\frac{\frac{1}{3}}{\frac{1}{3} + \frac{1}{3} \cdot \frac{2}{3} + \frac{1}{3} \cdot \frac{1}{3}} = \frac{1}{2};$$

that of the second is $\frac{1}{3}$, that of the third $\frac{1}{3}$.

Hence the chance of the new drawing giving a white ball is

$$\frac{1}{2} + \frac{1}{3} \cdot \frac{2}{3} + \frac{1}{3} \cdot \frac{1}{3} = \frac{7}{9}.$$

15. The calculations required in the application of formulas (12) and (13) are often tedious, and such questions may often be solved in a simpler manner. Let us consider the following:

An urn contains n black or white balls. A ball is drawn and replaced; if this has been done r times, and in every case a white ball has appeared, to find the chance that the $(r+1)$ th drawing will give a white ball.

FIG. 1.

time—or again in drawing 1000 balls together from an urn containing a great number of black and white in equal proportion.

As $p = q = \frac{1}{2}$, we find from formula (8) that the chance of exactly half the entire number drawn, viz., 500, being white is

$$T = \frac{1}{\sqrt{500\pi}} = .02523;$$

and the chance for any number $500 \pm s$ is found by multiplying T by $e^{-\frac{s^2}{500}}$.

If then we take the central ordinate to represent T on any scale, and arrange along the horizontal line AB the different numbers of white balls which may occur, and erect opposite each number an ordinate representing the probability of that number, we have a graphical diagram of the relative possibilities of all possible proportions of black and white in the result.

We see from it that all values of the number of white balls drawn less than 450, or greater than 550, may be considered impossible, the probabilities for them being exceedingly small.

The probability of the number of white balls falling between any two assigned limits, as 490 and 520, is found by measuring the area of the figure comprised between the two ordinates opposite those numbers, and dividing the result by the total area.

II. PROBABILITY OF FUTURE EVENTS DEDUCED FROM EXPERIENCE.

13. In our ignorance of the causes which influence future events, the cases are rare in which we know *a priori* the chance, or "facility," of the occurrence of any given event, as we do, for instance, that of a coin turning up head when tossed. In other cases we have to judge of the chances of it happening from experience alone. We could not say what is the chance that snow will fall in the month of March next from our knowledge of meteorology, but have to go back to the recorded facts. In walking down a certain street at 5 o'clock on three different days, I have twice met a certain individual, and wish to estimate from these data the likelihood of again meeting him under the same circumstances—in ignorance of the real state of things, viz., that he lives in that street, and returns from his business at that hour. Such is nearly the position in which we stand as to the probabilities of the future in the majority of cases.

We have to judge then, from certain recorded facts of the probability of the causes which have occasioned them, and thence to deduce the probabilities of future events occurring under the operation of the same causes. The term

that the ratio of the white balls in the urn to the whole number lies between any two given limits α, β is

$$p = \frac{\int_{\alpha}^{\beta} x^m (1-x)^n dx}{\int_0^1 x^m (1-x)^n dx} \dots (14).$$

The curve of frequency for the point X after the event—that is, the ordinate of which at any point of AB is proportional to the frequency or density of the positions of X in the immediate vicinity of that point—is

$$y = x^m (1-x)^n;$$

the maximum ordinate KV occurs at a point K, dividing AB in the ratio $m:n$,—the ratio of the total numbers of white and black balls being thus more likely to be that of the numbers of each actually drawn than any other.

Let us suppose, for instance, that three white and two black have been drawn; to find the chance that the proportion of white balls is between $\frac{2}{5}$ and $\frac{3}{5}$ of the whole; that is, that it differs by less than $\pm \frac{1}{5}$ from $\frac{3}{5}$, its most natural value.

$$p = \frac{\int_{\frac{2}{5}}^{\frac{3}{5}} x^3 (1-x)^2 dx}{\int_0^1 x^3 (1-x)^2 dx} = \frac{2256}{5^5} = \frac{18}{25} \text{ nearly.}$$

18. An event has happened m times and failed n times in $m+n$ trials. To find the probability that in $p+q$ further trials it shall happen p times and fail q times,—that is, that $p+q$ more points being taken at random in AB, p shall fall in AX and q in XB. The whole number of cases is measured by

$$(AB)^{p+q} \frac{|m+n|}{|m| |n|} \int_0^1 x^m (1-x)^n dx = \frac{|m+n|}{|m| |n|} \int_0^1 x^m (1-x)^n dx.$$

The number of favorable cases, when any particular set of p points, out of the $p+q$ additional trials, falls in AX, is measured by

$$\frac{|m+n|}{|m| |n|} \int_0^1 x^{m+p} (1-x)^{n+q} dx,$$

because, the number of cases as to the $m+n$ points being, when X falls on the element dx ,

$$\frac{|m+n|}{|m| |n|} x^m (1-x)^n dx,$$

each of these affords $x^p (1-x)^q$ cases where p new points fall on AX, and q on XB.

Now, the number of different sets of p points being

$$\frac{|p+q|}{|p| |q|},$$

the required probability is

$$\omega = \frac{|p+q|}{|p| |q|} \frac{\int_0^1 x^{m+p} (1-x)^{n+q} dx}{\int_0^1 x^m (1-x)^n dx} \dots (15);$$

or, by means of the known values of these definite integrals,

$$\omega = \frac{|p+q|}{|p| |q|} \cdot \frac{|m+p| |n+q|}{|m| |n|} \cdot \frac{|m+n+1|}{|m+n+p+q+1|} \dots (16).$$

For instance, the chance that in one more trial the event shall happen is $\frac{m+1}{m+n+2}$. This is easy to verify, as the line AB has been divided into $m+n+2$ sections by the $m+n+1$ points taken on it (including X). Now if one more trial is made, i.e., one more point taken at random, it is equally likely to fall in any section; and $m+1$ sections are favorable.

19. When the number of trials $m+n$ in art. 17 is large, the probability is considerable that the facility of the event on a single trial will not differ from its most natural value,

viz., $\frac{m}{m+n}$ by more than a very small deviation. To make this apparent, we shall have to modify the formula (14), which gives for the chance that this facility lies between the limits α and β (by substituting for the denominator its known value),

$$p = \frac{|m+n+1|}{|m| |n|} \int_{\alpha}^{\beta} x^m (1-x)^n dx \dots (17).$$

To find now the probability that the facility lies between the limits $\beta = \frac{m}{m+n} + \delta$, and $\alpha = \frac{m}{m+n} - \delta$, where δ is small.

Put for x , $\frac{m}{m+n} + x$; and (17) becomes

$$p = \frac{|m+n+1|}{|m| |n|} \int_{-\delta}^{\delta} \left(\frac{m}{m+n} + x \right)^m \left(\frac{n}{m+n} - x \right)^n dx.$$

Now if x is small, and we put $u = (a+x)^m$,

$$\log u = m \log a + m \frac{x}{a} - \frac{mx^2}{2a^2}$$

$$\therefore u = a^m e^{\frac{mx}{a} - \frac{mx^2}{2a^2}}$$

correct as far as the square of x . Hence the two factors under the sign of integration become

$$\frac{m^m}{(m+n)^m} e^{(m+n)x - \frac{(m+n)^2 x^2}{2m}}, \text{ and } \frac{n^n}{(m+n)^n} e^{-(m+n)x - \frac{(m+n)^2 x^2}{2n}};$$

so that

$$p = \frac{|m+n+1|}{|m| |n|} \frac{m^m n^n}{(m+n)^{m+n}} \int_{-\delta}^{\delta} e^{\frac{(m+n)^2 x^2}{2mn}} dx \dots (18).$$

Now, since by Stirling's theorem $|m| = m^{m+\frac{1}{2}} e^{-m} \sqrt{2\pi}$, the constant coefficient here becomes

$$\frac{(m+n+1)(m+n)^{m+n+\frac{1}{2}} e^{-m-n} \sqrt{2\pi}}{m^m n^n \cdot e^{-m-n} 2\pi \sqrt{mn}} = \frac{(m+n)^{\frac{1}{2}}}{\sqrt{2mn}},$$

taking $m+n+1 = m+n$. Now if we substitute in (18)

$$t = x \frac{(m+n)^{\frac{1}{2}}}{\sqrt{2mn}} \dots (19),$$

$$p = \frac{1}{\sqrt{\pi}} \int_{-\lambda}^{\lambda} e^{-t^2} dt,$$

where

$$\lambda + \delta \frac{(m+n)^{\frac{1}{2}}}{\sqrt{2mn}} \dots (20),$$

or finally

$$p = \frac{2}{\sqrt{\pi}} \int_0^{\lambda} e^{-t^2} dt, \dots (21),$$

for the approximate value of the probability that the real facility of the event lies between the limits $\frac{m}{m+n} \pm \delta$.

Thus, if out of 10,000 trials, the event has happened 5000 times, the probability that, out of an infinite number, the number of successes shall lie between $\frac{1}{2} \pm \frac{1}{100}$, or between $\frac{100}{200}$ and $\frac{200}{200}$, of the whole, will be

$$p = .678 = \frac{2}{3} \text{ nearly,}$$

for we find from (20) $\lambda = \frac{10^6}{\frac{1}{2} 10^4 \sqrt{2}} \frac{1}{200} = .7$ nearly; and, re-

ferring to the table in art. 9, we find the above value for the integral (21).

We must refer to the sixth chapter of Laplace for the investigation of how far the number of successes in a given number of fresh trials may be expected to deviate from the natural proportion, viz., that of the observed cases—as also for several closely allied questions, with important applications to statistics.

III. ON EXPECTATION.

20. The value of a given chance of obtaining a given sum of money is the chance multiplied by that sum; for in a great number of trials this would give the sum actually realized. The same may be said as to loss. Thus if it is 2 to 1 that a horse will win a race, it is considered a fair wager to lay £10 [\$48.60] to £20 [\$97.20] on the result; for the value of the expected gain is $\frac{1}{3}$ of 10, and that of the expected loss $\frac{1}{3}$ of 20, which are equal. Thus, if the probabilities for and against an event are p, q , and I arrange in any way to gain a sum a if it happens and lose a sum b if it fails, then if $pa = qb$ I shall neither gain nor lose in the long run; but if the ratio $a:b$ be less than this, my expectation of loss exceeds that of gain; or, in other words, I must lose in the long run.

The above definition is what is called the *mathematical expectation*; but it clearly is not a proper measure of the advantage or loss to the individual; for a poor man would undoubtedly prefer £500 [\$2430] down to the chance of £1000 [\$4860] if a certain coin turns up head. The importance of a sum of money to an individual, or its *moral value*, as it has been called, depends on many circumstances which it is im-

possible to take into account; but, roughly and generally, there is no doubt that Daniel Bernoulli's hypothesis, viz., that this importance is measured by the sum divided by the fortune of the individual—is a true and natural one. Thus, generally speaking, £5 [\$24.30] is the same to a man with £1000 [\$4860] as £50 [\$243] to one with £10,000 [\$48,600]; and it may be observed that this principle is very generally acted on in taxation, etc.

21. To estimate, according to this hypothesis, the advantage or moral value of his whole fortune to the individual, or his *moral fortune*, as Laplace calls it, in contradistinction to his *physical fortune*, let x = his *physical fortune*, y = his *moral fortune*, then, if the former receive an increment dx , we have, from Daniel Bernoulli's principle,

$$dy = k \frac{dx}{x};$$

$$\therefore y = k \log \frac{x}{h} \dots \dots \dots (22),$$

k, h being two constants. x and y are always positive, and $x > h$; for every man must possess some fortune or its equivalent, in order to live.

22. To estimate now the value of a *moral expectation*. Suppose a person whose fortune is a to have the chance p of obtaining a sum α , q of obtaining β , r of obtaining γ , etc., and let

$$p + q + r + \dots = 1,$$

only one of the events being possible. Now his *moral expectation* from the first chance—that is, the increment of his moral fortune into the chance—is

$$pk \left\{ \log \frac{a+\alpha}{h} - \log \frac{a}{h} \right\} = pk \log(a+\alpha) - pk \log a.$$

Hence his whole *moral expectation* is²

$E = kp \log(a+\alpha) + kq \log(a+\beta) + kr \log(a+\gamma) + \dots - k \log a$; and, if Y stands for his moral fortune including this expectation, that is $k \log \frac{a}{h} + E$, we have

$Y = kp \log(a+\alpha) + kq \log(a+\beta) + \dots - k \log h \dots (23)$. Let X be the *physical fortune* corresponding to this moral one, by (22)

$$Y = k \log X - k \log h.$$

Hence $X = (a+\alpha)^p (a+\beta)^q (a+\gamma)^r \dots \dots \dots (24)$;

and $X - a$ will be the actual or *physical increase of fortune* which is of the same value to him as his expectation, and which he may reasonably accept in lieu of it.

The mathematical value of the same expectation is

$$p\alpha + q\beta + r\gamma + \dots \dots \dots (25).$$

23. Several results follow from (24). Thus, if the sums $\alpha, \beta, \gamma \dots$ are very small, it is easy to see that the moral expectation coincides with the mathematical, for

$$X = a^{p+q+\dots} \left(1 + \frac{\alpha}{a}\right)^p \left(1 + \frac{\beta}{a}\right)^q \dots = a^{p+q+\dots} \left(1 + p\frac{\alpha}{a} + q\frac{\beta}{a} + \dots\right);$$

$$\therefore X = a + p\alpha + q\beta + \dots$$

24. We may show also that it is disadvantageous to play at even a fair game of chance (unless the stakes are very small, in which case the last article applies). Thus, suppose a man whose fortune is a plays at a game where his chance of winning a sum α is p , and his chance of losing a sum β is $q = 1 - p$. If the game is fair,

$$p\alpha = q\beta$$

Now by (24) the *physical fortune* which is equivalent to his prospects after the game is

$$X = (a+\alpha)^p (a-\beta)^q$$

$$\text{or } X = (a+\alpha)^{\frac{\alpha}{\alpha+\beta}} (a-\beta)^{\frac{\beta}{\alpha+\beta}}.$$

Now the geometrical mean of r quantities is less than the

¹ This rule must be understood to hold only when the sum is very small, or rather infinitesimal, strictly speaking. It would lead to absurdities if it were used for large increments (though Buffon has done so; see Todhunter, p. 345). Thus, to a man possessing £100, it is of the same importance to receive a gift of £100 as two separate gifts of £50; but this rule would give as the measure of the importance of the first $\frac{1}{100} = 1$; while in the other case, it would give $\frac{1}{50} + \frac{1}{50} = \frac{2}{50}$. The real measure of the importance of an increment when not small is a matter for calculation, as shown in the text.

² It is important to remark that we should be wrong in thus adding the expectations if the events were not mutually exclusive. For the mathematical expectations it is not so.

arithmetical,³ so that if there are β quantities $a + \alpha$, and α quantities $a - \beta$,

$$\left\{ (a+\alpha)^\beta (a-\beta)^\alpha \right\}^{\frac{1}{\alpha+\beta}} < \frac{\beta(a+\alpha) + \alpha(a-\beta)}{\alpha+\beta},$$

or

$$X < a;$$

so that he must expect morally to lose by the game.

25. The advantage of *insurance* against risks may be seen by the following instance. A merchant, whose fortune is represented by 1, will realize a sum ϵ if a certain vessel arrives safely. Let the probability of this be p . To make up exactly for the risk run by the insurance company, he should pay them a sum

$$(1-p)\epsilon.$$

If he does, his moral fortune becomes by (22)

$$k \log \frac{1+p\epsilon}{h};$$

while, if he does not insure, it will be (23).

$$kp \log \frac{1+\epsilon}{h}.$$

Now the first of these exceeds the second, so that he gains by insuring on these terms; because

$$\log(1+p\epsilon) > p \log(1+\epsilon),$$

that is $(1+p\epsilon)^{\frac{1}{p}} > 1+\epsilon$;

for, putting $p = \frac{m}{m+n}$,

$$\left(\frac{m(1+\epsilon) + n}{m+n} \right)^{m+n} > (1+\epsilon)^m,$$

because (see note art. 24), if $m(1+\epsilon) + n$ is divided into $m+n$ equal parts, their product is greater than that of m parts each equal to $1+\epsilon$ and n parts each equal to 1.

The merchant will still gain by paying, over and above what covers the risk of the company, a sum α , at most, which satisfies

$$\log(1-\alpha+p\epsilon) = p \log(1+\epsilon);$$

$$\therefore \alpha = 1 + p\epsilon - (1+\epsilon)^p.$$

By paying any sum not exceeding this value, he still gains, while the insurance office also makes a profit, which is really a certainty when it has a large business; so that, as Laplace remarks, this example explains how such an office renders a real service to the public, while making a profit for itself. In this it differs from a gambling establishment, in which case the public must lose, in any sense of the term.

It may be shown that it is better to expose one's fortune in separate sums to risks independent of each other than to expose the whole to the same danger.⁴ Suppose a merchant, having a fortune a , has besides a sum ϵ which he must receive if a ship arrives in safety. By (24) the value in money of his present fortune is

$$X = (a+\epsilon)^p a^q,$$

where p = chance of the ship arriving, and $q = 1 - p$.

Now suppose he risks the same sum in two equal portions, in two ships. We cannot apply (23), as the events are not mutually exclusive; but we see that, if both ships arrive, the chance of this being p^2 , he realizes the whole sum ϵ ; if one only arrives, the chance being $2pq$, he receives $\frac{1}{2}\epsilon$; if both are lost, the chance being q^2 , he loses all. Thus (24) he is now worth a sum.

$$X' = (a+\epsilon)^{p^2} (a+\frac{1}{2}\epsilon)^{2pq} a^{q^2}.$$

Now this sum is greater than the former; for

$$(a+\epsilon)^{p^2-p} (a+\frac{1}{2}\epsilon)^{2pq} a^{q^2-q} > 1,$$

that is,

$$(a+\epsilon)^{-pq} (a+\frac{1}{2}\epsilon)^{2pq} a^{-pq} > 1;$$

$$\text{for } \frac{(a+\frac{1}{2}\epsilon)^2}{a(a+\epsilon)} > 1,$$

as is obviously true.

Now suppose he risks the sum ϵ in *three* separate ventures. His fortune will be

$$X'' = (a+\epsilon)^{p^3} (a+\frac{2}{3}\epsilon)^{3p^2q} (a+\frac{1}{3}\epsilon)^{3pq^2} a^{q^3};$$

³ A very simple proof of this principle is as follows.—let a number N be divided into r parts a, b, c , etc.; if any two of these, as a, b , are unequal, since

$$\left(\frac{a+b}{2} \right)^2 > ab,$$

it follows that the product $abcd \dots$ is increased by substituting $\frac{a+b}{2}, \frac{a+b}{2}$, for a and b . Hence as long as any two are unequal we can divide N differently so as to obtain a greater product; and therefore when the parts are all equal the product is greatest, or

$$\left(\frac{a+b+c+\dots}{r} \right)^r > abc \dots$$

⁴ The familiar expression not to "put all one's eggs in the same basket" shows us how general common sense has recognized this principle.

This holds for any event whose *a priori* probability is n^{-1} .

If n be very large, this probability will be very small, unless p is nearly $=1$; and, indeed, if we go back to the common sense view, it is clear we should hesitate to believe a man who said he had drawn the white ball from a bag containing 10,000 balls, all but it being black. It may be observed that if $n=2$, $\varpi=p$, as in art. 27.

We have thus a scientific explanation of the universal tendency rather to reject the evidence of a witness than to accept the truth of a fact attested by him, when it is in itself of an extraordinary or very improbable nature.

29. Two independent witnesses, A and B, both state a fact, or that an event turned out in a particular way (only two ways being possible), to find the probability of the truth of the statement.

Supposing nothing is known *a priori* as to the event in question let a great number N of trials be made as to such events; the number of successes will be $\frac{1}{2}N$; out of these the witness A affirms the success in $\frac{1}{2}pN$ cases; out of these the witness B affirms it, too, in $\frac{1}{2}pp'N$ cases.¹ Out of the $\frac{1}{2}N$ failures A affirms a success in $\frac{1}{2}(1-p)N$ cases; and out of these B also affirms one in $\frac{1}{2}(1-p)(1-p')N$ cases. Hence, dividing the favorable cases by the whole number the probability sought is

$$\varpi = \frac{pp'}{pp' + (1-p)(1-p')} \dots \dots (27),$$

where p, p' are the credibilities of the two witnesses.

This very important result also holds if p be the probability of the event derived from any source, and p' the credibility of one witness, as in art. 28; or if p and p' be any independent probabilities, derived from any sources, as to one event.

30. We give another method of establishing the formula (27). Referring to art. 13, the observed event is the concurrent evidence of A and B that a statement is true. There are two hypotheses—that it is true or false. Antecedent to B's evidence the probabilities of these hypotheses are p and $1-p$ (art. 27), as A has said that it is true. The observed event now is that B says the same. On the first hypothesis, the probability that he will say this is p' ; on the second it is $1-p'$. Hence by formula (12) the probability *a posteriori* of the first hypothesis, viz., that the joint statement is true, is, as before

$$\frac{pp'}{pp' + (1-p)(1-p')}.$$

31. If a third witness, whose credibility is p'' , concurs with the two former, we shall have to combine p'' with ϖ in formula (27); hence the probability ϖ' of the statement when made by three witnesses is

$$\varpi' = \frac{\varpi p''}{\varpi p'' + (1-\varpi)(1-p'')} = \frac{pp'p''}{pp'p'' + (1-p)(1-p')(1-p'')} \quad (28);$$

and so on for any number.

As an example, let us find how many witnesses to a fact, the odds against which are 1,000,000,000 to 1, would be required to make it an even chance that the fact did occur, supposing the credibility of each witness to be $p=\frac{1}{10}$.

Let x be the number.

$$\begin{aligned} \frac{1}{2} &= \frac{10^{-12}p^x}{10^{-12}p^x + (1-10^{-12})(1-p)^x} = \frac{p^x}{p^x + 10^{12}(1-p)^x}; \\ \therefore 2 &= 1 + \frac{10^{12}}{9^x}; \\ \therefore x &= \frac{12}{\log 9} = 12.6; \end{aligned}$$

so that thirteen such witnesses would render the chance more than an even one.

32. Let us now consider an event which may turn out in more than two ways, and let each way be equally probable *a priori*, and suppose a witness whose credibility is p states that it turned out in a certain way; what is the chance that it did so?

Thus if a die has been thrown, and he states that ace turned up; or if tickets in a lottery are numbered 1, 2, 3, etc., and he states that 1 was drawn; to find the chance that he is right.

Take the case of the die, and suppose a great number N of throws. In $\frac{1}{6}N$ the ace turns up, and he says so in $\frac{1}{6}pN$ cases. In $\frac{1}{6}N$ the two turns up, and he is wrong in $\frac{1}{6}(1-p)N$ cases out of these; but he says ace is only $\frac{1}{6}$ of these, as there is no reason why he should give it more or less often than any of the five wrong numbers. In the same way for

the other throws; so that the whole number of cases where he says ace turned up is

$$\frac{1}{6}pN + \frac{1}{6}\frac{5}{6}(1-p)N = \frac{1}{6}N;$$

and, the number, out of these, when it actually turned up being $\frac{1}{6}N$, we find the chance it did turn up is p , the credibility of the witness. In any such case, this result will hold. We might indeed safely have argued that when the die is thrown a great number of times, any witness, whatever his veracity, will quote each face as often as any other, as there is no reason for one to turn up oftener than another, nor for him to affirm, rightly or wrongly, one rather than another; so that he will say ace in $\frac{1}{6}N$ of the throws, while he says ace in $\frac{1}{6}pN$ out of the $\frac{1}{6}N$ cases where it does turn up.

This result compared with art. 28 affords an apparent paradox. If a large number of tickets are marked 1,0,0,0,0,0, and a witness states that 1 has been drawn from the bag, we see from art. 28 that the chance he is right is very small; whereas if the tickets were marked 1,2,3,4,5,6, and he states that 1 has been drawn, the chance he is right is p , his own credibility. However, we must remember that in the first case he is limited to two statements, 1 and 0, and he makes the first, which is very improbable in itself; whereas in the other case, the assertion he makes is in itself as probable as any other he can make—e. g., that 2 was the ticket drawn—and therefore our expectation of its truth depends on his own credibility only.

33. Suppose now that two witnesses A, B both assert that the event has turned out in a certain way,—there being, as in art. 32, n equally probable ways.

Both, for instance, say that in a lottery numbered 1,2,3,4,5, No. 1 has been drawn. A large number N of drawings being made, 1 is drawn in $n^{-1}N$ cases; out of these A says 1 in $n^{-1}pN$ cases, and out of these B also says 1 in $n^{-1}pp'N$. No. 2 is drawn in $n^{-1}N$ cases; here A is wrong in $n^{-1}(1-p)N$, but says 1 in only $(n-1)^{-1}n^{-1}(1-p)N$; and B will also say 1 in $(1-p')(n-1)^{-1}$ of these; that is, both agree that 1 has been drawn in

$$(n-1)^{-2}n^{-1}(1-p)(1-p')N$$

cases. So likewise if No. 3 has been drawn, and so on; hence, when No. 1 has not been drawn, they both say that it has in

$$n^{-1}(n-1)^{-1}(1-p)(1-p')N$$

cases. Hence the number of cases where they are right divided by the whole number of cases where they make the statement, that is, the probability that No. 1 has been drawn, is

$$\varpi = \frac{pp'}{pp' + (n-1)^{-1}(1-p)(1-p')} \dots \dots (29).$$

If n be a large number the chance that they have named the ticket drawn is nearly certainty. Thus, if two independent witnesses both select the same man out of a large number, as the one they have seen commit a crime, the presumption is very strong against him. Of course, for the case to come under the above formula, it is supposed that some one of the number must be guilty.

34. In the same case, when the event may turn out in n ways not equally probable, as in a race between n horses A, B, C whose chances of winning are a, b, c, \dots , so that $a+b+c+\dots=1$, if one witness whose credibility is p states that A has won, it is easily shown by the same reasoning as in art. 33 that the probability A has really won is

$$\varpi = \frac{ap}{ap + (1-a)(n-1)^{-1}(1-p)} \dots \dots (30);$$

and if two witnesses say so, it is

$$\varpi = \frac{app'}{app' + (1-a)(n-1)^{-2}(1-p)(1-p')} \dots \dots (31).$$

It is easily shown in formula (30) that if $p > n^{-1}$ the probability ϖ is increased by the testimony, beyond a , its antecedent value. Thus, suppose there are ten horses in a race, and that one of them, A, has a chance $\frac{1}{10}$ of winning, and that just after the race I learn that a black horse has won, black being A's color; now, if I know that $\frac{1}{10}$ of racehorses in general are black, this gives me a new chance $\frac{1}{10}$ (see art. 16) that A has won. Therefore from (30) the chance of the event is now $\frac{1}{10} = \frac{1}{10}$.

35. To illustrate the effect of discordant testimony. In art. 29 let A have asserted that the fact occurred, and let B deny it. It is easy to see that $1-p'$ is to be put for p' , so that the probability that it did occur is

$$\varpi = \frac{p(1-p')}{p(1-p') + p'(1-p)} \dots \dots (32);$$

if there had been an *a priori* probability a in favor of the fact this would have been

$$\varpi = \frac{ap(1-p')}{ap(1-p') + p'(1-a)(1-p)} \dots \dots (33).$$

¹ Here we are assuming the independence of the witnesses. If B, for instance, were disposed to follow A's statements or to dissent from them, he would affirm the success here in more or less than $\frac{1}{6}pp'N$ cases.

Thus if the credit of both witnesses were the same, $p = p'$, and we find from (33) $\varpi = a$, so that the evidence has not altered the likelihood of the event.

36. Where the event may turn out in n equally probable ways as in art. 33, and the witness A asserts one to have occurred, say the ticket marked 1 to have been drawn, while the witness B asserts another, say the ticket marked 2; to find the chance that No. 1 was drawn.

By the same reasoning as in art. 33 we find for the chance

$$\varpi = \frac{p(1-p')}{p(1-p') + (n-1) \cdot \frac{1}{2}(1-p)(n-2+p')} \dots (34).$$

This result will also follow if we consider B's evidence as testimony in favor of No. 1 of the value $(1-p')(n-1)^{-1}$.

When the number of tickets n is very great, (34) gives

$$\varpi = \frac{p - pp'}{1 - pp'}.$$

37. As remarked in art. 26, the methods we have given for determining the probability of testimony apply to cases where the evidence is derived from other sources. Thus, suppose it has been found that a certain symptom (A) indicates the presence of a certain disease in three cases out of four, there is a probability $\frac{3}{4}$ that any patient exhibiting the symptom has the disease. This, however, must be considered in conjunction with the *a priori* probability of the presence of the disease, if we wish to know the value of the evidence deduced from the symptom being observed. For instance, if we knew that $\frac{3}{4}$ of the whole population had the disease, the evidence would have no value, and the credibility of the symptom *per se* would be $\frac{3}{4}$, telling us nothing either way. For if a be the *a priori* probability, ϖ that after the evidence, p the credibility of the evidence, we have found

$$\varpi = \frac{ap}{ap + (1-a)(1-p)};$$

so that, if $\varpi = a$, $p = \frac{3}{4}$.

If ϖ and a are given, the credibility p of the evidence is deduced from this equation, viz.,

$$p = \frac{(1-a)\varpi}{a + \varpi - 2a\varpi}.$$

38. Suppose now the probability of the disease when the symptom A occurs is ϖ (that is, it is observed that the disease exists in ϖN cases out of a large number N where the symptom is found), and likewise the same probability when another independent symptom B occurs is ϖ' . What is the probability of the disease where both symptoms occur?

Let a be the *a priori* probability of the disease in all the cases; then the value of the evidence of B is, as explained above,

$$p' = \frac{(1-a)\varpi'}{a + \varpi' - 2a\varpi'};$$

and this has to be combined with ϖ , which is the probability of the disease after A is observed. We find the probability (II) required to be

$$\Pi = \frac{\varpi p' + (1-\varpi)(1-p')}{(1-a)\varpi\varpi' + a(1-\varpi')(1-\varpi')};$$

whence $\Pi = \frac{\varpi p' + (1-\varpi)(1-p')}{(1-a)\varpi\varpi' + a(1-\varpi')(1-\varpi')} \dots (35).$

Thus, if the *a priori* probability of the disease in all the patients was $\frac{1}{4}$, and 3 out of 4 have the disease where A is observed, and also 3 out of 4 where B is observed, the chance is $\frac{3}{4}$ that the disease exists when both symptoms are present.

This question illustrates the exceeding delicacy and care required in reasoning on probabilities. If we had combined the two given probabilities in the usual way without considering the *a priori* value (as would be correct if this were quite unknown, or $= \frac{1}{2}$) we should have had

$$\Pi = \frac{\varpi\varpi'}{\varpi\varpi' + (1-\varpi)(1-\varpi')}.$$

The fallacy of so doing will appear if we consider a large

1 Or thus: let N = whole population and n, n' the numbers who show the symptoms A and B respectively, all these numbers being large. Now aN = whole number who have the disease; $\varpi n, \varpi' n'$ the numbers out of n, n' who have it. Now $\varpi n, \varpi' n'$ are both comprised in aN ; and out of $\varpi n, \varpi' n'$, the number also included in ϖn is the same fraction of ϖn that $\varpi' n'$ is of aN ; that is, the number who have both symptoms and the disease is

$$\frac{\varpi n \varpi' n'}{aN}$$

and those who have both symptoms and have not the disease is

$$(1-\varpi)n \frac{(1-\varpi')n'}{(1-a)N};$$

so that, if both symptoms are present, the odds that it is a case of the disease are as

$$\frac{\varpi\varpi'}{a} : \frac{(1-\varpi)(1-\varpi')}{1-a}.$$

population, and a very uncommon disease, and that the latter is observed to exist in $\frac{1}{2}$ the cases where the symptom A occurs, and also in $\frac{1}{2}$ for the symptom B; this formula would give $\frac{1}{2}$ for the chance when both are present. This is clearly absurd; for, both the disease and the symptoms being by hypothesis extremely rare, and the symptoms being independent, that is, having no connection with each other, it is next to impossible that any one individual of the $\frac{1}{2}N(A)$ —calling $N(A)$ the number who have the symptom A—who have not the disease should also be comprised in the $\frac{1}{2}N(B)$ who have not the disease, because this $\frac{1}{2}N(A), \frac{1}{2}N(B)$ are very small numbers (relatively) taken indiscriminately from the whole population who are free from the disease. It is different for the $\frac{1}{2}N(A), \frac{1}{2}N(B)$ cases who have the disease; these cases all come out of the very small number $N(D)$ who have the disease; therefore several individuals will be probably common to both; hence, if both symptoms coexist, it is highly probable that the case is one of the disease.

We find from (35) the true probability to be in the present case

$$\Pi = 1 - a,$$

so that, if only 1 in 1000 have the disease, the chance is 999 to 1, instead of an even one.

39. If a coin thrown m times has turned up head every time, the chance derived from this experience alone that the real facility for head exceeds $\frac{1}{2}$ is, by formula (14),

$$\varpi = \frac{\int_{\frac{1}{2}}^1 x^m dx}{\int_0^1 x^m dx} = 1 - \frac{1}{2^{m+1}}.$$

But there is here a very strong *a priori* presumption that the facility is $\frac{1}{2}$; suppose then that there is a very small *a priori* probability (p) that either in the coin itself or the way it is thrown there is something more favorable to head than to tail; after the new evidence the probability of this will be

$$\frac{p\varpi}{p\varpi + (1-p)(1-\varpi)} = \frac{(2^m + 1 - 1)p}{(2^m + 1 - 2)p + 1}.$$

Thus if there is an *a priori* probability $\frac{1}{1000}$, and if the coin has turned up head 5 times and never tail, the probability that the facility for head exceeds that for tail becomes

$$\frac{63}{62 + 1000} = \frac{60}{1000} \text{ nearly.}$$

40. From art. 19 we see that if a large number of trials $m + n$ be made as to any event, m being favorable, it may be considered certain that the real facility differs from $m/(m+n)$ by a very small fraction at most. If then our *a priori* idea as to the facility gives it outside the limits derived from formula (21), the evidence from experience will overrule our *a priori* presumption. Thus, if a shilling thrown up 1000 times gives head 560 times and tail 440, the evidence thus afforded that the throws were not fair is so much stronger than any antecedent conviction we could have to the contrary that we may conclude with certainty that, from some cause or other, head is more likely than tail.

41. Closely allied to the subject of our present section are the applications of the theory of probabilities to the verdicts of juries, the decisions of courts, and the results of elections. Our limits, however, will hardly allow of even a sketch of the methods given by Condorcet, Laplace, and Poisson, as it is not possible to render them intelligible within a short compass. We must therefore refer the reader to Todhunter's *History*, as well as the original works of these writers, especially to Poisson's *Recherches sur la Probabilité des Jugements*.

42. We will consider here one remarkable question given by Laplace, because the mathematical difficulty may be solved in a simpler way than by deducing it as a case of a general problem given in his chap. ii., or than Todhunter's method (see his p. 545), which depends on Lejeune Dirichlet's theorem in multiple integrals.

An event (suppose the death of a certain person) must have proceeded from one of n causes A, B, C, etc., and a tribunal has to pronounce on which is the most probable.

Let each member of the tribunal arrange the causes in the order of their probability according to his judgment, after weighing the evidence. To compare the presumption thus afforded by any one judge in favor of a specified cause with that afforded by the other judges, we must assign a value to the probability of the cause derived solely from its being, say, the r th on his list. As he is supposed to be unable to pronounce any closer to the truth than to say (suppose) H is more likely than D, D more likely than L, etc., the probability of any cause will be the average value of all those which that probability can have, given simply that it always

occupies the same place on the list of the probabilities arranged in order of magnitude. As the sum of the n probabilities is always 1, the question reduces to this—

Any whole (such as the number 1) is divided at random into n parts, and the parts are arranged in the order of their magnitude—least, second, third, . . . greatest; this is repeated for the same whole a great number of times; required the mean value of the least, of the second, etc., parts, up to that of the greatest.

Let the whole in question be represented by a line $AB=a$, and let it be divided at random into n parts by taking $n-1$ points indiscriminately on it. Let the required mean values be

$$\lambda_1 a, \lambda_2 a, \lambda_3 a, \dots, \lambda_n a,$$

where $\lambda_1, \lambda_2, \lambda_3, \dots$ must be constant fractions. As a great number of positions is taken in AB for each of the n points, we may take a as representing that number; and the whole number N of cases will be

$$N = a^{n-1}.$$

The sum of the least parts, in every case, will be

$$S_1 = N\lambda_1 a = \lambda_1 a^n.$$

Let a small increment, $Bb = \delta a$, be added on to the line AB at the end B; the increase in this sum is $\delta S_1 = n\lambda_1 a^{n-1} \delta a$.

But, in dividing the new line Ab, either the $n-1$ points all fall on AB as before, or $n-2$ fall on AB and 1 on Bb (the cases where two or more fall on Bb are so few we may neglect them). If all fall on AB, the least part is always the same as before except when it is the last, at the end B of the line, and then it is greater than before by δa ; as it falls last in $n-1$ of the whole number of trials, the increase in S_1 is $n-1 a^{n-1} \delta a$. But if one point of division falls on Bb, the number of new cases introduced is $(n-1)a^{n-2} \delta a$; but, the least part being now an infinitesimal, the sum S_1 is not affected; we have therefore

$$\delta S_1 = n\lambda_1 a^{n-1} \delta a = n-1 a^{n-1} \delta a;$$

$$\therefore \lambda_1 = n^{-1}.$$

To find λ_2 , reasoning exactly in the same way, we find that where one point falls on Bb and $n-2$ on AB, as the least part is infinitesimal, the second least part is the least of the $n-1$ parts made by the $n-2$ points; consequently, if we put λ'_1 for the value of λ_1 when there are $n-1$ parts only, instead of n ,

$$\begin{aligned} \delta S_1 &= n\lambda_2 a^{n-1} \delta a = n-1 a^{n-1} \delta a + (n-1) a^{n-2} \lambda'_1 a \delta a, \\ \therefore n\lambda_2 &= n-1 + (n-1)\lambda'_1; \text{ but } \lambda'_1 = (n-1)^{-1}; \\ \therefore n\lambda_2 &= n-1 + (n-1)^{-1}. \end{aligned}$$

In the same way we can show generally that

$$n\lambda_r = n-1 + (n-1)^{r-1} n^{-r+1};$$

and thus the required mean value of the r th part is

$$\lambda_r a = a n^{-1} \left\{ n-1 + (n-1)^{-1} + (n-2)^{-1} + \dots + (n-r+1)^{-1} \right\} \dots (36).$$

Thus each judge implicitly assigns the probabilities

$$\frac{1}{n^2}, \frac{1}{n} \left(\frac{1}{n} + \frac{1}{n-1} \right), \frac{1}{n} \left(\frac{1}{n} + \frac{1}{n-1} + \frac{1}{n-2} \right), \dots$$

to the causes as they stand on his list, beginning from the lowest.

Laplace now says we should add the numbers thus found on the different lists for the cause A, also for B, etc.; and that cause which has the greatest sum is the most probable. This doubtless seemed self-evident to him, but ordinary minds will hardly be convinced of its correctness without proof. Let the lists of two of the judges be, beginning from the lowest,

B, H, R, K, A

C, K, D, H, B

Probabilities $\lambda_1, \lambda_2, \lambda_3, \lambda_4, \lambda_5, \dots$

As the opinions of all the judges are supposed of equal weight, the cause H here is as likely as the cause K; but the probability that H or K was the cause is¹

$$\lambda_2 + \lambda_4.$$

Hence prob. (H) + prob. (K) = 2 prob. (H) = $\lambda_2 + \lambda_4$;

$$\therefore \text{prob. (H)} = \frac{1}{2}(\lambda_2 + \lambda_4);$$

that is, the probability of any cause is the mean of its probabilities on the two lists, the circumstance being clearly immaterial whether the same cause K is found opposite to it or not. The same follows for 3 or more lists.

¹ This is the same as if there was only one judge. If both presented all the causes in the same order the probabilities are the same as if there were one; if now one judge transposes two causes he does not alter the chance that one or other of them is true; and again this chance solely depends on the positions of the two causes in the lists, and is the same whatever the arrangements as to the remaining causes.

43. Laplace applies the same method to elections. Suppose there are n candidates for an office; each elector is to arrange them in what he believes to be the order of merit; and we have first to find the numerical value of the merit he thus implicitly attributes to each candidate. Fixing on some limit a as the maximum of merit, n arbitrary values less than a are taken and then arranged in order of magnitude—least, second, third, . . . greatest; to find the mean value of each.

Take a line $AB=a$, and set off n arbitrary lengths AX, AY, AZ . . . beginning at A; that is, n points are taken at random in AB. Now the mean values of AX, XY, YZ, . . . are all equal; for if a new point P be taken at random, it is equally likely to be 1st, 2d, 3d, etc., in order beginning from A, because out of $n+1$ points the chance of an assigned one being 1st is $(n+1)^{-1}$; of its being 2d $(n+1)^{-1}$; and so on. But the chance of P being 1st is equal to the mean value of AX divided by AB; of its being 2d $M(XY) \div AB$; and so on. Hence the mean value of AX is $AB(n+1)^{-1}$; that of AY is $2AB(n+1)^{-1}$; and so on. Thus the mean merit assigned to the several candidates is

$$a(n+1)^{-1}, 2a(n+1)^{-1}, 3a(n+1)^{-1}, \dots, na(n+1)^{-1}.$$

Thus the relative merits may be estimated by writing under the names of the candidates the numbers 1, 2, 3, . . . n . The same being done by each elector, the probability will be in favor of the candidate who has the greatest sum.

Practically it is to be feared that this plan would not succeed, though certainly the most rational and logical one if the conditions are fulfilled—because as Laplace observes, not only are electors swayed by many considerations independent of the merit of the candidates, but they would often place low down in their list any candidate whom they judged a formidable competitor to the one they preferred, thus giving an unfair advantage to candidates of mediocre merit.

There are, however, many cases where such objections would not apply, and therefore where Laplace's method would be certainly the most rational. Thus, suppose a jury or committee or board of examiners have to decide on the relative merit of a number of prize essays, designs for a building, etc.; each member should place them in what he judges to be the order of merit, beginning with the worst, and write over them the numbers 1, 2, 3, 4, etc.; then the relative merit of each essay, etc., would be represented by the sum of the numbers against it in each list. No doubt there would be cases where a juror would observe a great difference in merit between one essay and the one below it, which difference would not be adequately rendered by an excess of one in the number. But even then, as such superiority could not fail to be recognized by the other members of the tribunal, it is not likely that any injustice would result.

44. An argument advanced in support of a proposition differs from the case of testimony in that, if the argument is bad, the previous probability of the conclusion is unaffected. Let p be the *a priori* probability of the proposition, q the chance that the argument is correct; then in a large number N of cases, in qN the argument is good, and therefore the proposition is true; and out of the remaining $(1-q)N$, where the argument is bad, there are $p(1-q)N$ cases where the proposition is nevertheless true. Hence the probability of the conclusion is

$$p + q - pq.$$

Hence any argument, however weak, adds something to the force of preceding arguments.

V. ON MEAN VALUES AND THE THEORY OF ERRORS.

45. The idea of a mean or average among many differing magnitudes of the same kind is one continually employed, and of great value. It gives us in one result, easily pictured to the mind and easily remembered, a general idea of a number of quantities which perhaps we have never seen or observed, and we can thus convey the same idea to others, without giving a long list of the quantities themselves. We could scarcely form any clear conception as to the duration of human life, unless by taking the average,—that is, finding the length of life each individual would have if the whole sum of the years attained by each were equally divided among the entire population. How, again, could we so easily form an idea of the climate of Rome or Nice as by learning the mean of the temperatures of each day for a year, or a series of years? Here, again, it will be an important addition to the information to find also the mean summer temperature and the mean in winter, as we thus learn

what extremes of heat and cold are to be expected. We may even go further and inquire the diurnal variation in the temperature in summer or in winter; and for this we should know the average of a number of particular cases.

It may be said that the whole value of statistics depends on the doctrine of averages. The price of wheat and of other commodities, the increase or decrease of a particular crime, the age of marriages both for men and women, the amount of rain at a given locality, the advance of education, the distribution of wealth, the spread of disease, and numberless other subjects for inquiry—are instances where we often see hasty and misleading conclusions drawn from one or two particular cases which happen to make an impression, but where the philosophical method bids us to observe the results in a large number, and then to present them as summed up and represented by the average or mean.

46. There is another application of averages of a different nature from the foregoing. Different estimates of the same thing are given by several independent authorities: thus the precise moment of an earthquake is differently stated by correspondents in the papers; different heights are given for a mountain by travellers; or suppose I have myself measured the height of a building a number of times, never obtaining exactly the same result. In all such cases (if we have no reason to attach greater weight to one result than to another) our common sense tells us that the average of all the estimates is more likely to be the truth than any other value. In these cases, as M. Quetelet remarks, there is this important distinction from the preceding, that the mean value represents a thing actually existing; whereas in the others it merely serves to give a kind of general idea of a number of individuals essentially different, though of the same kind. Thus if I take the mean of the heights of 200 houses in a long street, it does not stand for any real entity, but is a mere ideal height, representing as nearly as possible those of the individual houses, whereas, in taking 200 measurements of the same house, their mean is intended to give, and will very nearly give, the actual height of that house.

47. So far it is obvious how to proceed in such cases; but it becomes a most important question in the theory of probabilities, to determine how far we can rely on the mean value of the different observations, giving us the true magnitude we seek,—or rather, as we never can expect it to give exactly that value, to ascertain with what probability we may expect the error not to exceed any assigned limit. Such is the inquiry on which we are about to enter.

This investigation is of the more importance, because we find what is really the same problem present itself again under circumstances different from what we have been considering. In the measurement of any whole by means of repeated partial measurements—as, for instance, in measuring a distance by means of a chain—the error in the result is the sum of all the partial errors (with their proper signs) incurred at each successive application of the chain. If we would know, then, the amount of confidence we may have in the accuracy of the result, we must determine, as well as we can, the probability of the error—that is, the sum of all the partial errors—not exceeding assigned limits; and to this end, we have in the first place to try to determine the law of facility, or frequency, of different values of this sum. The problem only differs from the preceding in that here we seek for the facility of the sum of the errors; in the former, of the n th part of that sum.

In both these cases, we may reasonably and naturally suppose that the error incurred in each observation, or each measurement, follows the same law as to the frequency of its different possible values and as to its limits, as each is made by the same observer, under the same circumstances, though what that law is may be unknown to us. But there is another class of cases where the same problem presents itself. An astronomical observation is made (say) of the zenith distance of a star at a particular instant; the error in this determination is a complex one, caused by an error in the time, an error in the refraction, errors of the instrument, personal error of the observer, and others. The error of the observation is in fact the sum of the partial errors arising from these different sources; now these evidently cannot be taken each to follow the same law, so that we have here a more general problem of the same species, viz., to combine a number of partial errors, each having its own law of facility and limits.

There is every reason to suppose that the error incurred in any single observation or measurement of any kind is generally due to the operation of a large number of independent sources of error; if we adopt this hypothesis, we have the same problem to solve in order to arrive at the law of facility of any single error.

48. We will consider the question as put by Poisson (*Re-*

cherches, p. 254; see Todhunter, *History*, p. 561), and will adopt a method which greatly shortens the way to the result.

Let x be the error arising from the combination or superposition of a large number of errors e_1, e_2, e_3, \dots each of which by itself is supposed very small, then

$$x = e_1 + e_2 + e_3 + \dots \quad (37).$$

Each partial error is capable of a number, large or small, of values, all small in themselves; and this number may be quite different for each error e_1, e_2, e_3, \dots . There may be more positive than negative, or less, for each.¹ If n_1, n_2, n_3, \dots be the numbers of values of the several errors, the number of different values of the compound error x will be

$$n_1 n_2 n_3 \dots$$

We will suppose it, however, to take an indefinite number of values N , some multiple of the above, so that the n_1, n_2, n_3, \dots different values are repeated, but all equally often, so as to leave the relative facility of the different values unaltered. We will suppose the same number N of values in every case, whether more or fewer of the partial errors e_1, e_2, e_3, \dots are included or not.

Let the frequency of an error of magnitude x be called y , and let the equation expressing the frequency be

$$y = f(x) \quad (38)$$

i.e., $y dx$ = number of values of x between x and $x + dx$.

The whole number of values is

$$N = \int_{\mu'}^{\mu} f(x) dx,$$

where μ, μ' are the sums of the higher and lower limits of all the partial errors.

If now a new partial error e be included with the others, let it have n particular values e, e', e'', \dots ; if it had but the one value e , then to every value x of the old compound error would correspond one x' of the new, such that $x' + e = x$; and the number of values of the new from x' to $x' + dx'$ is the same as of the old from x to $x + dx$ —that is, $f(x) dx$, or $f(x' - e) dx'$. Now the next value e' gives, besides these, the number $f(x' - e') dx'$, and so on. Thus the whole number of values of the new compound error between x' and $x' + dx'$ is

$$\{f(x' - e) + f(x' - e') + f(x' - e'') + \dots\} dx'.$$

Hence the equation of frequency for the new error is (dropping the accent, and dividing by n —that is, reducing the total number of values from Nn to N , the same as before)

$$y = n^{-1} \{f(x - e) + f(x - e') + f(x - e'') + \dots\} \quad (39).$$

Hence

$$y = f(x) - \frac{e + e' + e'' + \dots}{n} f'(x) + \frac{e^2 + e'^2 + e''^2 + \dots}{n} f''(x),$$

neglecting higher powers of e, e', \dots

Hence if a new partial error e , whose mean value = a , and whose mean square is λ , be superposed on the compound error (38) resulting from the combination of a large number of partial errors, the equation of frequency for resulting error is

$$y = f(x) - a f'(x) + \frac{1}{2} \lambda f''(x) = (1 - aD + \frac{1}{2} \lambda D^2) f(x). \quad (40)$$

It thus appears that each of the small errors only enters the result by its mean value a , and mean square λ .

If a second error were superposed, we should thus have

$$y = (1 - a_1 D + \frac{1}{2} \lambda_1 D^2)(1 - a_2 D + \frac{1}{2} \lambda_2 D^2) f(x);$$

$$\therefore y = \{1 - (a + a_1)D + (\frac{1}{2}(\lambda + \lambda_1) + a a_1)D^2\} f(x);$$

as λ is a lower infinitesimal than a , we retain no other terms.

$$\therefore y = \left\{1 - (a + a_1)D + \frac{\lambda + \lambda' - a^2 - a_1^2 + (a + a_1)^2}{2} D^2\right\} f(x).$$

Thus any two errors enter the result in terms of $a + a_1$ and $\lambda + \lambda' - a^2 - a_1^2$; as this holds for any two, it is easy to see that all the partial errors in (37) enter the equation of frequency (38) only in terms of m and $h - i$; putting

$$\left. \begin{aligned} m &= a_1 + a_2 + a_3 + \dots = \text{sum of mean errors,} \\ h &= \lambda_1 + \lambda_2 + \lambda_3 + \dots = \text{sum of mean squares of errors,} \\ i &= a_1^2 + a_2^2 + a_3^2 + \dots = \text{sum of squares of mean errors,} \end{aligned} \right\} \quad (41).$$

Thus, $y = f(x) = F(x, m, h - i)$.

Let m receive an increment δm ; this is equivalent to superposing a new error whose mean value is δm , and mean square infinitely smaller (e.g., let its values be all $+$, or indeed we may take it to have but the single value δm);

$$\therefore \delta y = \frac{dy}{dm} \delta m = - \frac{dy}{dx} \delta m, \text{ by (40);}$$

$$\therefore \frac{dy}{dm} = - \frac{dy}{dx}.$$

¹ An error may have all its values positive, or all negative. In estimating the instant when a star crosses the meridian we may err in excess or defect, but in estimating that when it emerges from behind the moon, we can only err in excess. We have heard this instance given by Clerk Maxwell.

Hence y is a function of $x-m$; so our equation must be of the form

$$y = F(x-m, h-i) \dots \dots \dots (42).$$

Let h receive an increment δh ; or conceive a new error whose mean value $a=0$, and whose mean square $=\delta h$; we have (40)

$$\frac{dy}{dh} = \frac{d^2y}{dx^2} \delta h.$$

$$\frac{d^2y}{dx^2} = 2 \frac{dy}{dh} \dots \dots \dots (43).$$

Hence

Let us now suppose in (37) that all the values of every error are increased in the ratio r ; all the values of x are increased in the same ratio; consequently there are the same number of values of x from rx to $r(x+dx)$ as there were before from x to $x+dx$. This gives

$$F(x-m, h-i)dx = F(rx-rm, r^2(h-i))r dx,$$

for m is increased in the ratio r , and h and i in the ratio r^2 . Let us write for shortness

$$\xi = x-m, \eta = h-i,$$

so that

$$y = F(\xi, \eta) \dots \dots \dots (44);$$

we have

$$r^{-1}F(\xi, \eta) = F(r\xi, r^2\eta).$$

Let $r = 1 + \omega$, where ω is infinitesimal;

$$(1-\omega)y = F(\xi + \omega\xi, \eta + 2\omega\eta);$$

$$\therefore y - \omega y = y + \omega\xi \frac{dy}{d\xi} + 2\omega\eta \frac{dy}{d\eta};$$

$$\therefore \xi \frac{dy}{d\xi} + 2\eta \frac{dy}{d\eta} + y = 0 \dots \dots \dots (45).$$

$$\text{This equation, and } \frac{d^2y}{d\xi^2} = 2 \frac{dy}{d\eta} \dots \dots \dots (46),$$

identical with (43), contain the solution of the problem.

Thus, (45) gives by integration

$$y = \eta \psi^{-\frac{1}{2}} (\xi^2 \eta^{-1}) \dots \dots \dots (47).$$

Again, combining (45) and (46),

$$\eta \frac{d^2y}{d\xi^2} + \xi \frac{dy}{d\xi} + y = 0,$$

or

$$\frac{d}{d\xi} \left(\eta \frac{dy}{d\xi} + \xi y \right) = 0;$$

$$\therefore \eta \frac{dy}{d\xi} + \xi y = \chi(\eta).$$

Substitute for y the value (47); and we find

$$2\xi\eta^{-\frac{1}{2}}\psi'(\xi^2\eta^{-1}) + \xi\eta^{-\frac{1}{2}}\psi(\xi^2\eta^{-1}) = \chi(\eta);$$

that is, a function of $\xi\eta^{-\frac{1}{2}}$ identical with a function of η . This cannot be, unless both sides are constant. Hence

$\eta \frac{dy}{d\xi} + \xi y = c$. Now $c=0$, for $\frac{dy}{d\xi}$ vanishes with ξ , by (47); and, y being always finite, the left hand member vanishes with ξ ;

$$\therefore 2\psi'(\xi^2\eta^{-1}) + \psi(\xi^2\eta^{-1}) = 0.$$

$$\therefore \psi(\xi^2\eta^{-1}) = C e^{-\frac{1}{2}\xi^2\eta^{-1}}.$$

Substituting in (47) and restoring the values of ξ, η , we find the form of the function (42) to be

$$y = C(h-i)^{-\frac{1}{2}} e^{-\frac{(x-m)^2}{2(h-i)}} \dots \dots \dots (48).$$

C is a constant depending on the number N .

The probability of the error x falling between x and $x+dx$ is found by dividing ydx by the whole area of the curve (48); i.e.,

$$p = \left\{ 2\pi(h-i) \right\}^{-\frac{1}{2}} e^{-\frac{(x-m)^2}{2(h-i)}} dx \dots \dots \dots (49).$$

49. If, instead of eq. (37), we had put

$$x = \gamma_1 \epsilon_1 + \gamma_2 \epsilon_2 + \gamma_3 \epsilon_3 + \dots \dots \dots (50),$$

here $\gamma_1, \gamma_2, \gamma_3 \dots$ are any numerical factors, the formula (49) gives the probability for x , provided h, i, m are taken to be

$$\begin{aligned} m &= \gamma_1 a_1 + \gamma_2 a_2 + \gamma_3 a_3 + \dots \\ h &= \gamma_1^2 a_1^2 + \gamma_2^2 a_2^2 + \gamma_3^2 a_3^2 + \dots \\ i &= \gamma_1^2 a_1^2 + \gamma_2^2 a_2^2 + \gamma_3^2 a_3^2 + \dots \end{aligned} \dots \dots (51),$$

instead of the values in (41).

50. If we take the integral of eq. (49), between any two limits, μ, ν , it gives us the probability that the sum x of the errors lies between μ and ν —that is, that the mean of all the errors lies between μr^{-1} and νr^{-1} , if r is the number of the partial errors in (37).

The most likely value of x (that is, for which the frequency is greatest) is of course $x=m$, and the chance that x does not differ from m by more than $\pm \delta$ is

$$\varpi = \frac{1}{\sqrt{2\pi(h-i)}} \int_{m-\delta}^{m+\delta} e^{-\frac{(x-m)^2}{2(h-i)}} dx.$$

In this put $(x-m) \left\{ 2(h-i) \right\}^{-\frac{1}{2}} = t$; $\therefore dx = dt \sqrt{2(h-i)}$.

The limits $m \pm \delta$ for x become $\pm \delta \left\{ 2(h-i) \right\}^{-\frac{1}{2}}$ for t ; hence, putting

$$\tau = \delta \left\{ 2(h-i) \right\}^{-\frac{1}{2}},$$

and remembering that $\int_{-\tau}^{\tau} e^{-t^2} dt = 2 \int_0^{\tau} e^{-t^2} dt$,

we find

$$\varpi = \frac{2}{\sqrt{\pi}} \int_0^{\tau} e^{-t^2} dt \dots \dots \dots (52)$$

is the probability that the sum x of the errors in (37) lies between the limits $m \pm \tau \sqrt{2(h-i)}$; ϖ is also the probability that the mean of all the errors, xr^{-1} , lies between the limits

$$mr^{-1} \pm \tau r^{-1} \sqrt{2(h-i)}.$$

51. The important result (48), which is the key to the whole theory of errors, contains several particular cases which Laplace gives in his fourth chapter. We may first make one or two remarks on it.

(1) $h-i$ is always positive; for in (41)

$$\lambda_1 > a_1^2, \lambda_2 > a_2^2, \text{ etc.},$$

because the mean of the squares of n numbers is always greater than the square of the mean.¹

(2) To find the mean value $M(x)$ of the sum x , and the mean value of its square $M(x^2)$, we have

$$M(x) = \frac{\int x y dx}{\int y dx}; \quad M(x^2) = \frac{\int x^2 y dx}{\int y dx},$$

the limits being $\pm \infty$. Hence

$$M(x) = m; \quad M(x^2) = m^2 + h-i.$$

The first is obvious from the fact that to every value $m+x$ for x there corresponds another $m-x$. Both results also easily follow from common algebra: the case is that of a sum, x ,

$$x = \epsilon_1 + \epsilon_2 + \epsilon_3 + \dots,$$

where each quantity $\epsilon_1, \epsilon_2, \epsilon_3 \dots$ goes through an independent series of values; and it is easily proved that

$$M(x) = M(\epsilon_1) + M(\epsilon_2) + M(\epsilon_3) + \dots = \Sigma M \epsilon_i;$$

$$M(x^2) = M(\epsilon_1^2) + M(\epsilon_2^2) + M(\epsilon_3^2) + \dots + 2\Sigma \{ M(\epsilon_1)M(\epsilon_2) \} \\ = (\Sigma M \epsilon_i)^2 - \Sigma (M \epsilon_i)^2 + \Sigma M(\epsilon_i^2).$$

52. One particular case of the general problem in art. 48 is when the errors $\epsilon_1, \epsilon_2, \epsilon_3 \dots$ in (37) all follow exactly the same law; as, for instance, if $\epsilon_1, \epsilon_2, \epsilon_3 \dots$ are the errors committed in observing the same magnitude, under exactly the same circumstances, a great number of times; and we are asked to find the chance that the sum of the errors, or that their arithmetical mean, shall fall between given limits. Here the law of facility for each error is of course the same, though we may not know what it is.

We have then from (41)

$$m = r \epsilon_1, \quad h = r \lambda_1, \quad i = r a_1^2,$$

so that in eq. (52),

$$\varpi = \frac{2}{\sqrt{\pi}} \int_0^{\tau} e^{-t^2} dt \dots \dots \dots (53).$$

is the probability that the mean of all the errors shall lie between $a_1 \pm \tau \sqrt{2r^{-1}(\lambda_1 - a_1^2)}$

a_1 here is the mean of all the possible values of the error in this particular observation, which are of course infinite in number; and (53) shows us, what is evident beforehand, that the more the number r of observations is increased the narrower do the limits for the mean error become for a given probability ϖ ; so that if, suppose, we take $r=3$, and $r=\infty$, we have very nearly $\varpi=1$, and it becomes practically certain that the mean of the actual observations will differ from a_1 by an infinitesimal deviation.

53. What we have found hitherto would be of very little practical use, because the constants involved suppose the amounts of the errors known, and therefore the true value known of the quantity which is observed or measured. It is, however, precisely this true value which we usually do not know and are trying to find. Let us now suppose a large number r of measurements, which we will call

$$a_1 a_2 a_3 \dots a_r,$$

made of a magnitude whose true but unknown value is A .

The (unknown) errors of the observations will be

$$\epsilon_1 = a_1 - A, \quad \epsilon_2 = a_2 - A, \quad \epsilon_3 = a_3 - A \dots;$$

$$\therefore r^{-1}(\epsilon_1 + \epsilon_2 + \dots + \epsilon_r) = r^{-1}(a_1 + a_2 + \dots + a_r) - A;$$

or

$$M(\epsilon_1) = M(a_1) - A;$$

¹ This may be very easily proved by reasoning precisely analogous to that employed in the note on article 24.

or the mean of the errors is the error committed in taking the mean of the observations as the value of A.

Hence (53) ϖ is the probability that the error committed in taking the mean of the observations as the truth shall lie between

$$a_1 \pm r\sqrt{2r^{-1}(\lambda_1 - a_1^2)}.$$

Here a_1 is the true mean of the errors of an infinite number of observations, λ_1 the mean of their squares. As we have no means of determining a_1 (except that it is nearly equal to the mean of the errors we are dealing with, which would give us no result), we have to limit the generality of the question by assuming that the law of error of the observation gives positive and negative errors with equal facility; if so $a_1 = 0$, and we have the probability ϖ that the error lies between

$$\pm r\sqrt{2r^{-1}\lambda_1}.$$

Here λ_1 , which is the mean of the squares of all possible values of the error of the observation, will be at least very nearly the mean square of the actual values of the errors, if r is large;

$$\therefore \lambda_1 = r^{-1}(e_1^2 + e_2^2 + \dots e_r^2);$$

$$\therefore \lambda_1 = r^{-1}\{(a_1 - A)^2 + (a_2 - A)^2 + \dots (a_r - A)^2\};$$

$$\text{or } \lambda_1 = M(a_1^2) - 2AM(a_1) + A^2 \\ = M(a_1^2) - (Ma_1)^2 + (Ma_1 - A)^2.$$

Rejecting the last term, as the square of a very small quantity,

$$\lambda_1 = M(a_1^2) - (Ma_1)^2,$$

and we have the probability ϖ (in (53)) that the error in taking the mean of the observations as the truth lies between

$$\pm r\sqrt{2r^{-1}\{M(a_1^2) - (Ma_1)^2\}} \dots (54).$$

a value depending on the mean square, and mean first power, of the observed values.

These limits may be put in a different form, rather easier for calculation. If $f_1, f_2, f_3 \dots f_r$ be the apparent errors, that is, not the real ones, but what they would be on the hypothesis that the mean is the true value, then, putting M for $r^{-1}(a_1 + a_2 + \dots a_r)$,

$$f_1 = a_1 - M, f_2 = a_2 - M, \dots f_r = a_r - M;$$

$$\therefore M(f_1^2) = M(a_1^2) - 2M \cdot M + M^2 = M(a_1^2) - (Ma_1)^2;$$

so that $\lambda = M(f_1^2)$, and (54) may be written

$$\pm r\sqrt{2r^{-1} \cdot (f_1^2 + f_2^2 + \dots f_r^2)r^{-1}} \dots (55).$$

54. In the last article we have made no assumption as to the law of frequency of the error in the observation as we are considering, except that it gives positive and negative values with equal facility. If, however, we adopt the hypothesis (see art. 47) that every error in practice arises from the joint operation of a number of independent causes, the partial error due to each of which is of very small importance, then the process in art. 48 will apply, and we may conclude that the errors of every series of observations of the same magnitude made in the same circumstances follow the law of frequency in formula (48); and if we suppose, as is universally done, that positive and negative values are equally probable, the law will be

$$y = Cc^{-1}e^{-x^2c^{-2}}$$

and the probability (49) will be

$$p = c^{-1}r^{-1}e^{-x^2c^{-2}}dx \dots (56),$$

where c is a constant which is sometimes called the modulus of the system.

Every error in practice, then, is of the form (56), and is similar to every other. If c be small, the error has small amplitudes, and the series of observations are accurate.

If, as supposed in art. 53, a set of observations have been made, we can determine the modulus c , with an accuracy increasing with the number in the set. For (art. 51)

$\frac{1}{2}c^2 =$ true mean square of all possible values of the error. This we have called λ_1 in last article, and have shown it nearly equal to $M(a_1^2) - (Ma_1)^2$ or $M(f_1^2)$; so that $\frac{1}{2}c^2 =$ mean square of obs. - (mean of obs.)² = mean square of apparent errors.

55. Thus, if a set of observations have been made, and c thus determined from them, it is easy to see that

$$\left. \begin{aligned} \text{Mean error} &= \pm c\pi^{-\frac{1}{2}} = 0.5642c \\ \text{Mean square of error} &= \frac{1}{2}c^2 \\ \text{Probable error} &= \pm 0.4769c \end{aligned} \right\} \dots (57).$$

The mean error means that of all the positive or all the negative errors. The probable error is the value which half the errors exceed and half fall short of, so that it is an even chance that the error of any particular observation lies between the limits $\pm 0.4769c$. Its value is found from the table in art. 9, taking $I = \frac{1}{2}$.

56. We have often to consider the law of error of the sum of several magnitudes, each of which has been determined

by a set of observations. Suppose A and B two such magnitudes, and X their sum, to find the law of error in

$$X = A + B.$$

Let the functions of error for A and B be

$$c^{-1}\pi^{-\frac{1}{2}}e^{-x^2c^{-2}}dx, \quad f^{-1}\pi^{-\frac{1}{2}}e^{-x^2f^{-2}}dx.$$

In formula (49) let $m = c$, $n = f$, $2h = c^2$; then the function for A is the law for the sum of a number of errors (37) the sum of whose mean squares is $h = \frac{1}{2}c^2$; likewise that for B is the law for the sum of a number the sum of whose mean squares is $\frac{1}{2}f^2$; the same formula (49) shows us that the law for the sum of these two series of errors—that is, for the sum of the errors of A and B—is

$$\left\{ \pi(c^2 + f^2) \right\}^{-\frac{1}{2}} e^{-x^2(c^2 + f^2)^{-1}} dx;$$

that is, the modulus for X or A + B is

$$\sqrt{c^2 + f^2}$$

Hence Probable error of X = .4769 $\sqrt{c^2 + f^2}$

$$\therefore (\text{p.e. of } X)^2 = (\text{p.e. of } A)^2 + (\text{p.e. of } B)^2 \dots (58).$$

So likewise for the mean error.

If X were the difference A - B, (58) still holds.

If X be the sum of m magnitudes A, B, C . . . instead of two, its probable error is in like manner

$$(\text{p.e. } X)^2 = (\text{p.e. } A)^2 + (\text{p.e. } B)^2 + \text{etc.};$$

and if the function of error for A, B, C . . . be the same for all

$$(\text{p.e. } X)^2 = m(\text{p.e. } A)^2.$$

Also the probable error in the mean

$$M(A) = m^{-1}(A + B + C + \dots)$$

is the m th part of the above;

$$\therefore \text{p.e. of } M(A) = m^{-\frac{1}{2}}(\text{p.e. of } A) \dots (59).$$

Airy gives the following example. The co-latitude of a place is found by observing m times the Z.D. of a star at its upper culmination and n times its Z.D. at its lower culmination, to find the probable error.

By (59)

$$\text{p.e. upper Z.D.} = m^{-\frac{1}{2}} (\text{p.e. of an upper obs.});$$

$$\text{p.e. lower Z.D.} = n^{-\frac{1}{2}} (\text{p.e. of a lower obs.});$$

Now

$$\text{co-latitude} = \frac{1}{2}(\text{U.Z.D.} + \text{L.Z.D.}).$$

Hence (58)

$$(\text{p.e. co-lat})^2 = \frac{1}{4}m^{-1}(\text{p.e. up. obs.})^2 + \frac{1}{4}n^{-1}(\text{p.e. low. obs.})^2.$$

If the upper Z.D. observations are equally good with the lower,

$$\text{p.e. co-lat.} = \frac{1}{2}(\text{p.e. an. obs.})\sqrt{m^{-1} + n^{-1}}.$$

57. The magnitude to be found is often not observed directly, but another magnitude of which it is some function. Let A = true but unknown value of a quantity depending on another whose true unknown value is a , by the given function

$$A = f(a);$$

let an observed value for a be v , the corresponding value for A being V, then

$$V = f(v).$$

Let $\epsilon =$ error of v , then the error of V is

$$V - A = f(v + \epsilon) - f(a) = \epsilon f'(v) \dots (60),$$

as v is nearly equal to a .

Suppose now the same magnitude A also a given function $f_1(a_1)$ of a second magnitude a_1 , which is also observed and found to be v_1 ; also for a third, and so on; hence, writing $C = f'(v)$, $C_1 = f'_1(v_1)$, etc.

$$\left. \begin{aligned} V - A &= f'(v) \cdot \epsilon = C\epsilon \\ V_1 - A &= f'_1(v_1) \cdot \epsilon_1 = C_1\epsilon_1 \\ V_2 - A &= f'_2(v_2) \cdot \epsilon_2 = C_2\epsilon_2 \\ &\vdots \end{aligned} \right\} \dots (61);$$

and we have to judge of the best value for the unknown quantity, whose true value is called A. The arithmetical mean of V, $V_1, V_2 \dots$ seems the simplest, but it is not here the most probable, and we shall assume it to be a different mean, viz.,

$$X = \frac{mV + m_1V_1 + m_2V_2 + \dots}{m + m_1 + m_2 + \dots}$$

(As V, $V_1, V_2 \dots$ are very nearly equal, it would be easy to show that any other way of combining them would be equivalent to this.) The factors $m, m_1, m_2 \dots$ remain to be determined. From (61) the error of X is

$$X - A = \frac{mC\epsilon + m_1C_1\epsilon_1 + m_2C_2\epsilon_2 + \dots}{m + m_1 + m_2 + \dots} \dots (62).$$

Let the moduli of the errors $\epsilon, \epsilon_1, \epsilon_2 \dots$ be $c, c_1, c_2 \dots$ (see art. 56); then (see art. 49) for modulus of the error X - A we have

$$(\text{mod.})^2 = \frac{m^2C^2c^2 + m_1^2C_1^2c_1^2 + m_2^2C_2^2c_2^2 + \dots}{(m + m_1 + m_2 + \dots)^2} \dots (63).$$

If the factors $mm_1m_2 \dots$ are determined so as to make this modulus the least possible, the importance of the error $X - A$ is the least possible.

Differentiate with regard to m , and we find

$$mC^2c^2 = \frac{m^2C^2c^2 + m_1^2C_{11}^2 + \dots}{m + m_1 + m_2 + \dots}$$

Likewise for m_1 , and so on. Hence

$$mC^2c^2 = m_1C_{11}^2 = m_2C_{22}^2 = \dots, \text{ etc. ;}$$

so that the most accurate mean to take is

$$X = \frac{\frac{V}{C^2c^2} + \frac{V_1}{C_{11}^2} + \frac{V_2}{C_{22}^2} + \dots}{\frac{1}{C^2c^2} + \frac{1}{C_{11}^2} + \frac{1}{C_{22}^2} + \dots} \dots \dots (64).$$

The modulus of error in this value is, from (63),

$$\frac{1}{(\text{mod.})^2} = \frac{1}{C^2c^2} + \frac{1}{C_{11}^2} + \frac{1}{C_{22}^2} + \dots \dots (65).$$

58. The errors $\epsilon_1, \epsilon_2 \dots$ are unknown. We have as to the first

$$V - A = cf'(v) = (v - a)f'(v).$$

Let the values of the quantities observed corresponding to the value X that for sought be $x, x_1, x_2 \dots$

so that $X = f(x) = f_1(x_1) = f_2(x_2) \dots$

then $X - A = (x - a)f'(v);$

and, subtracting, $V - X = (v - x)f'(v) = (v - x)C.$

Here $V - X$ is the apparent error in V , $v - x$ the apparent error of the observation v , taking X as the true values.

Of course we have also

$$V_1 - X = (v_1 - x_1)C_1, \quad V_2 - X = (v_2 - x_2)C_2, \dots$$

If now we were to determine X so as to render the sum of squares of apparent errors of the observations, each divided by the square of its modulus, a minimum,—that is,

$$\frac{(v - x)^2}{C^2} + \frac{(v_1 - x_1)^2}{C_1^2} + \dots = \frac{(V - X)^2}{C^2c^2} + \frac{(V_1 - X)^2}{C_{11}^2} + \frac{(V_2 - X)^2}{C_{22}^2} + \dots,$$

etc.,

a minimum,—we shall find the same value (64) for X .

Of course if the modulus is the same for all the observations the sum of squares simply is to be made a minimum.

To take a very simple instance. An observed value of a quantity is P ; an observed value of a quantity known to be the square root of the former is Q ; what is the most probable value?

If X be taken for the quantity, the apparent error of P is $P - X$; the apparent error of Q is found from

$$(Q - e)^2 = X;$$

$$\therefore e = (Q^2 - X)/2Q;$$

$$\therefore (P - X)^2 + (Q^2 - X)^2/4Q^2 = \text{minimum};$$

$$\therefore X = (4P + 1)Q^2/(4Q^2 + 1);$$

the weight of both observations being supposed the same.

Again, suppose a circle is divided by a diameter into two semicircles; the whole circumference is measured and found to be L ; also the two semicircles are found to be M and N respectively. What is the most probable value of the circumference?

If X be taken as the circumference, the apparent error in L is $L - X$; those of M and N are $M - \frac{1}{2}X, N - \frac{1}{2}X$. Hence, if all the measurements are equally good,

$$(L - X)^2 + (M - \frac{1}{2}X)^2 + (N - \frac{1}{2}X)^2 = \text{minimum},$$

$$\therefore X = \frac{1}{3}(M + N + 2L)$$

is the most probable value.

The modulus of error of this result is (65) found to be

$$(\text{mod.})^2 = \frac{1}{3}(\text{mod. of measurements})^2$$

so that

$$\text{probable error} = (\text{prob. error of a measurement})/\sqrt{3}.$$

59. In the last article we have explained the method of least squares, as applied to determine one unknown element from more than one observation of the element itself or of others with which it is connected by known laws. If several observations of the element itself are made, it is obvious that the method of least squares gives the arithmetical mean of the observations as the best value, thus justifying what common sense seems to indicate. If the observations are not equally good, the best value will be

$$X = \frac{wV + w_1V_1 + w_2V_2 + \dots}{w + w_1 + w_2 + \dots}$$

calling w, w_1, w_2, \dots the weights of the different observations $V, V_1, V_2 \dots$

i.e., $w = c^{-2}, w_1 = c_1^{-2}, w_2 = c_2^{-2}, \text{ etc.}$

It would carry us beyond our assigned limits in this article

to attempt to demonstrate and explain the method of least squares when several elements have to be determined from a number of observations exceeding the elements in number. We must therefore refer the reader to the works already named, and also to the following: Gauss, *Theoria Combinationis Observationum*; Gauss, *Theoria Motus*; Airy, *Theory of Errors of Observation*; Leslie Ellis, in *Camb. Phil. Trans.*, vol. viii.

The rule in such cases is that the sum of squares of the apparent errors is to be made a minimum, as in the case of a single element. To take a very simple example:

A substance is weighed, and the weight is found to be W . It is then divided into two portions, whose weights are found to be P and Q . What is the most probable weight of the body?

Taking A and B as the weights of the two portions, the apparent errors are $P - A, Q - B$, and that of the whole is $W - A - B$; hence

$$(P - A)^2 + (Q - B)^2 + (W - A - B)^2 = \text{minimum}$$

there being two independent variables A, B .

$$\therefore P - A + W - A - B = 0;$$

$$Q - B + W - A - B = 0;$$

$$2A + B = P + W$$

$$2B + A = Q + W$$

$$\therefore A + B = \frac{1}{3}(P + Q + 2W);$$

$$A = \frac{1}{3}(2P + W - Q);$$

$$B = \frac{1}{3}(2Q + W - P);$$

which are the most probable weights of the whole and the two parts.

VI. ON LOCAL PROBABILITY.

60. It remains to give a brief account of the methods of determining the probabilities of the fulfilment of given conditions, by variable geometrical magnitudes, as well as the mean values of such magnitudes. Recent researches on this subject have led to many very remarkable results; and we may observe that to English mathematicians the credit almost exclusively belongs. It is a new instance, added to not a few which have gone before, of a revival for which we have to thank the eminent men who, during the 19th century, have enabled the country of Newton to take a place less unworthy of her in the world of mathematical science.

At present the investigations on this subject have not gone beyond the theoretical stage; but they should not be undervalued on this account. The history of the theory of probabilities has sufficiently shown that what at first seems merely ingenious and a matter of curiosity may turn out to have valuable applications to practical questions. How little could Pascal, James Bernoulli, and De Moivre have anticipated the future of the science which they were engaged in creating?

61. The great naturalist Buffon was the first who proposed and solved a question of this description. It was the following:

A floor is ruled with equidistant parallel lines; a rod, shorter than the distance between each pair, being thrown at random on the floor, to find the chance of its falling on one of the lines.

Let x be the distance of the centre of the rod from the nearest line, θ the inclination of the rod to a perpendicular to the parallels, $2a$ the common distance of the parallels, $2c$ the length of rod; then, as all values of x and θ between their extreme limits are equally probable, the whole number of cases will be represented by

$$\int_0^a \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} dx d\theta = \pi a$$

Now if the rod crosses one of the lines we must have $x > \frac{c}{\cos \theta}$; so that the favorable cases will be measured by

$$\int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} d\theta \int_0^{c \cos \theta} dx = 2c.$$

Thus the probability required is $p = 2c/\pi a$.

Laplace in solving this question suggests that by making a great number of trials, and counting the cases where the rod falls on a line, we could determine the value of π from this result. He further considers, for a given value of a , what length $2c$ should be chosen for the rod so as to give the least chance of error in a given large number N of throws.

In art. 8 we have shown that the chance that the number of successes shall lie between $pN \pm r$ is

$$\varpi = \frac{2}{\pi} \int_0^{\pi a} e^{-x^2} dx,$$

$$a^2 = \frac{1}{2p(1-p)N}.$$

where

For a given probability ϖ , πa is given. We have then a given chance that the number of successes shall differ from its most probable value pN by an error r which is the least possible fraction of the latter when r/pN , or when $1/apN$, or when $\sqrt{p(1-p)/p}$ is the least possible; that is, when $p^{-1} - 1 = \pi a/2c - 1$ is the least possible, or when c is the greatest possible. Now the greatest value of c is a ; the rod therefore should be equal to the distance between the lines.

Laplace's answer is incorrect, though originally given right (see Todhunter, p. 591; also Czuber, p. 90).

62. Questions on local probability and mean values are of course reducible, by the employment of Cartesian or other coordinates, to multiple integrals. Thus any one relating to the position of two variable points, by introducing their coordinates, can be made to depend on quadruple integrals,—whether in finding the sum of the values of a given function of the coordinates, with a view to obtaining its mean value, or in finding the number of the favorable cases, when ϖ probability is sought. The intricacy and difficulty to be encountered in dealing with such multiple integrals and their limits is so great that little success could be expected in attacking such questions directly by this method; and most of what has been done in the matter consists in turning the difficulty by various considerations, and arriving at the result by evading or simplifying the integrations. We have a certain analogy here in the variety of contrivances and artifices used in arriving at the values of definite integrals without performing the integrations. We will now select a few of such questions.

63. If a given space S is included within a given space A , the chance of a point P , taken at random on A , falling on S , is

$$p = S/A.$$

But if the space S be variable, and $M(S)$ be its mean value

$$p = M(S)/A \quad \dots \dots \dots (66)$$

For, if we suppose S to have n equally probable values S_1, S_2, S_3, \dots , the chance of any one S_i being taken, and of P falling on S_i , is

$$p_i = n^{-1} S_i/A;$$

now the whole probability $p = p_1 + p_2 + p_3 + \dots$, which leads at once to the above expression.

The chance of two points falling on S is, in the same way,

$$p = M(S^2)/A^2 \quad \dots \dots \dots (67);$$

and so on.

In such a case, if the probability be known, the mean value follows, and *vice versa*. Thus, we might find the mean value of the n th power of the distance XY between two points taken at random in a line of length l , by considering the chance that, if n more points are so taken, they shall all fall between X and Y . This chance is

$$M(XY)^n/l^n = 2(n+1)^{-1}(n+2)^{-1};$$

for the chance that X shall be one of the extreme points, out of the whole $(n+2)$, is $2(n+2)^{-1}$; and, if it is, the chance that the other extreme point is Y is $(n+1)^{-1}$. Therefore

$$M(XY)^n = 2l^n(n+1)^{-1}(n+2)^{-1}.$$

64. A line l is divided into n segments by $n-1$ points taken at random; to find the mean value of the product of the n segments.

Let a, b, c, \dots be the segments in one particular case. If n new points are taken at random in the line, the chance that one falls on each segment is

$$1, 2, 3, \dots, nabc \dots / l^n;$$

hence the chance that this occurs, however the line is divided, is

$$|nl^{-n}M(abc \dots)|.$$

Now the whole number of different orders in which the whole $2n-1$ points may occur is $|2n-1|$; out of these the number in which one of the first series falls between every two of the second is easily found by the theory of permutations to be

$$|n|n-1|.$$

Hence the required mean value of the product is

$$M(abc \dots) = \frac{|n-1|}{|2n-1|} l^n.$$

1 If S = number of successes, we have an assigned chance ϖ that S lies between $pN \pm r$; that is, the value of π lies between $\frac{2c}{\pi} \frac{N}{S \pm r}$, or $\frac{2c}{\pi} \frac{N}{S \pm \frac{Nr}{2c}}$. Hence the error in π is least when $2cr/S^2$ is least. Now $\pi \propto \sqrt{p(1-p)}$, $2\pi \propto p$, and $8\pi \propto p$ nearly; hence $\sqrt{p(1-p)/p}$ is to be the least possible.

65. If M be the mean value of any quantity depending on the positions of two points (*e.g.*, their distance) which are taken, one in a space A , the other in a space B (external to A); and if M' be the same mean when both points are taken indiscriminately in the whole space $A+B$; M_a, M_b the same mean when both points are taken in A and both in B respectively; then

$$(A+B)^2 M' = 2ABM + A^2 M_a + B^2 M_b.$$

If the space $A=B$,

$$4M' = 2M + M_a + M_b;$$

if, also, $M_a = M_b$,

$$2M' = M + M_a.$$

66. The mean distance of a point P within a given area from a fixed straight line (which does not meet the area) is evidently the distance of the centre of gravity G of the area from the line. Thus, if A, B are two fixed points on a line outside the area, the mean value of the area of the triangle APB = the triangle AGB .

From this it will follow that, if X, Y, Z are three points taken at random in three given spaces on a plane (such that they cannot all be cut by any one straight line), the mean value of the area of the triangle XYZ is the triangle $GG'G''$, determined by the three centres of gravity of the spaces. For example—

Two points X, Y are taken at random within a triangle. What is the mean area M of the triangle XYC , formed by joining them with one of the angles of the triangle?

Bisect the triangle by the line CD ; let M_1 be the mean value when both points fall in the triangle ACD , and M_2 the value when one falls in ACD and the other in BCD ; then $2M = M_1 + M_2$. But $M_1 = \frac{1}{2}M$; and $M_2 = GG'C$, where G, G' are the centres of gravity of ACD, BCD , this being a case of the above theorem; hence $M_2 = \frac{1}{3}ABC$, and

$$M = \frac{1}{3}ABC.$$

Hence the chance that a new point Z falls on the triangle XYC is $\frac{1}{3}$; and the chance that three points X, Y, Z taken at random form, with a vertex C , a re-entrant quadrilateral, is $\frac{1}{3}$.

67. If M be a mean value depending on the positions of n points falling on a space A ; and if this space receive a small increment a , and M' be the same mean when the n points are taken on $A+a$, and M_1 the same mean when one point falls on a and the remaining $n-1$ on A ; then, the sum of all the cases being $M'(A+a)^n$, and this sum consisting of the cases (1) when all the points are on A , (2) when one is on a the others on A (as we may neglect all where two or more fall on a), we have

$$M'(A+a)^n = MA^n + nM_1aA^{n-1};$$

$$\therefore (M' - M)A = na(M_1 - M) \quad \dots \dots (68),$$

as M' nearly $= M$.

As an example, suppose two points X, Y are taken in a line of length l , to find the mean value M of $(XY)^n$, as in art. 63.

If l receives an increment dl , formula (68) gives

$$ldM = 2dl(M_1 - M).$$

Now M_1 here = the mean n th power of the distance of a single point taken at random in l from one extremity of l ; and this is $l^n(n+1)^{-1}$ (as is shown by finding the chance of n other points falling on that distance); hence

$$ldM = 2dl(l^n(n+1)^{-1} - M);$$

$$\therefore ldM + 2Mdl = 2(n+1)^{-1}l^n dl,$$

or

$$l^{-1} \cdot d. M^2 = 2(n+1)^{-1}l^n dl;$$

$$\therefore M^2 = 2(n+1)^{-1}l^{n+1}dl = 2l^{n+2}(n+1)^{-1}(n+2)^{-1} + C;$$

$$\therefore M = 2l^n(n+1)^{-1}(n+2)^{-1},$$

as in art. 63, C being evidently 0.

68. If p is the probability of a certain condition being satisfied by the n points within A in art. 67, p' the same probability when they fall on the space $A+a$, and p_1 the same when one point falls on a and the rest on A , then, since the numbers of favorable cases are respectively $p'(A+a)^n$, pA^n , np_1aA^{n-1} , we find

$$(p' - p)A = na(p_1 - p) \quad \dots \dots (69).$$

Hence if $p' = p$ then $p_1 = p$; this result is often of great value. Thus if we have to find the chance of three points within a circle forming an acute-angle triangle, by adding an infinitesimal concentric ring to the circle, we have evidently $p' = p$; hence the required chance is unaltered by assuming one of the three points taken on the circumference.

Again, in finding the chance that four points within a triangle shall form a convex quadrilateral, adding to the triangle a small band between the base and a line parallel to it, the chance is clearly unaltered. Therefore by (69) we may take one of the points at random in the base of the triangle without altering the probability.

69. Historically, it would seem that the first question given on local probability, since Buffon, was the remarkable four-point problem of Prof. Sylvester. It is, in general, to find the probability that four points taken at random within a given boundary shall form a re-entrant quadrilateral. It is easy to see that this problem is identical with the problem of finding the mean area of the triangle formed by three points taken at random; for, if M be this mean, and A the given area, the chance of a fourth point falling on the triangle is M/A ; and the chance of a re-entrant quadrilateral is four times this, or $4M/A$.

Let the four points be taken with a triangle. We may take one of them W (Fig. 3) at random on the base (art. 68); the others X, Y, Z within the triangle. Now the four lines from the vertex B to the four points are as likely to occur in any specified order as any other. Hence it is an even chance that X, Y, Z fall on one of the triangles ABW, CBW , or that two fall on one of these triangles and the remaining one on the other. Hence the probability of a re-entrant quadrilateral is

$$\frac{1}{2}p_1 + \frac{1}{2}p_2,$$

where p_1 = prob. (WXYZ re-entrant), X, Y, Z in one triangle p_2 = do., X in one triangle, Y in the other, Z in either.

But $p_1 = \frac{2}{3}$ (art. 66). Now to find p_2 ; the chance of Z falling within the triangle WXY is the mean area of WXY divided by ABC . Now by the principle in art. 66, for any particular position of W , $M(WXY) = WGG'$, where G, G' are the centres of gravity of ABW, CBW . It is easy to see that $WGG' = \frac{1}{3}ABC = \frac{1}{3}$, putting $ABC = 1$. Now, if Z falls in CBW , the chance of $WXYZ$ re-entrant is $2M(IYW)$, for Y is as likely to fall in WXZ as Z to fall in WXY ; also if Z falls in ABW the chance of $WXYZ$ re-entrant is $2M(IXW)$. Thus the whole chance is $p_2 = 2M(IYW + IXW) = \frac{2}{3}$.

Hence the probability of a re-entrant quadrilateral is

$$\frac{1}{2} \cdot \frac{2}{3} + \frac{1}{2} \cdot \frac{2}{3} = \frac{2}{3}.$$

That of its being convex is $\frac{1}{3}$.

70. If three points X, Y, Z are taken at random in a triangle, the mean value of the triangle $XYZ = \frac{1}{12}$ of the given triangle. For we have seen that the chance of four points forming a re-entrant figure is $4M/A$, where M is the required mean and A the given triangle; as this has been shown to be $\frac{2}{3}$,

$$M = \frac{1}{12}A.$$

71. Let the three points be taken within a circle; and let M be the mean value of the triangle formed. Adding a concentric ring a , we have (68) since $M':M$ as the areas of the circles, $M' = \frac{A+a}{A}M$.

$$\therefore A \frac{A+a}{A} = 3a(M_1 - M); \therefore M = \frac{1}{3}M_1,$$

where M_1 is the value of M when one of the points is on the circumference.

Take O fixed; we have to find the mean value of OXY (Fig. 4). Taking (ρ, θ) (ρ', θ') as coordinates of X, Y ,

$$M_1 = (\pi a^2)^{-2} \iint \rho d\rho d\theta \iint \rho' d\rho' d\theta' (OXY).$$

$$\therefore M_1 = (\pi a^4)^{-1} \iint \iint \frac{1}{2} \rho \rho' \sin(\theta - \theta') d\rho d\rho' d\theta d\theta' \\ = (\pi a^4)^{-1} \cdot \frac{1}{2} \iint \int r^3 r'^3 \sin(\theta - \theta') d\theta d\theta',$$

putting $r = OH, r' = OK$; as $r = 2a \sin \theta, r' = 2a \sin \theta'$,

$$M_1 = \frac{1}{\pi^2 a^4} \cdot \frac{(2a)^6}{9} \int_0^\pi \int_0^\pi \sin^3 \theta \sin^3 \theta' \sin(\theta - \theta') d\theta d\theta'.$$

Professor Sylvester has remarked that this double integral, by means of the theorem

$$\int_0^a \int_0^x f(x, y) dx dy = \int_0^a \int_0^x f(a-y, a-x) dx dy,$$

is easily shown to be identical with

$$2 \int_0^\pi \int_0^\theta \sin^4 \theta \sin^3 \theta' \cos \theta' d\theta d\theta' = \frac{1}{2} \int_0^\pi \sin^2 \theta d\theta = \frac{1}{2} \cdot \frac{3}{2} \cdot \frac{5}{4} \cdot \frac{7}{8} \pi.$$

$$\therefore M_1 = \frac{35a^2}{36\pi}; \therefore M = \frac{35}{48\pi^2} \pi a^2.$$

Hence the probability that four points within a circle shall form a re-entrant figure is

$$p = \frac{35}{12\pi^2}.$$

72. Professor Sylvester has remarked that it would be a novel question in the calculus of variations to determine the form of the convex contour which renders the probability a maximum or minimum that four points taken within it shall give a re-entrant quadrilateral. It will not be difficult to show, by means of the principles we have been examining, that the circle is the contour which gives the minimum.

FIG. 4.

For, if p be the probability of a re-entrant figure for four points within a circle of area A , p' the same probability when a small addition a , of any kind, which still leaves the whole contour convex, is made to the circle, we have by (69)

$$(p' - p)A = 4a(p_1 - p),$$

where p_1 = the probability when one point is taken in a —that is, in the limit, when one point is taken on the circumference of the circle. But $p_1 = p$, as is shown in art. 68; hence

$$p' - p = 0.$$

Hence any infinitesimal variation of the contour from the circumference of the circle gives dp , the variation of the probability, zero,—the same method being applicable when portions are taken away, instead of being added, provided the contour is left convex.

Hence, for the circle, the probability is a maximum or minimum. It will be a minimum, because in the formula (68) for the mean triangle formed by three points

$$(M' - M)A = 3a(M_1 - M).$$

M_1 , which is the mean triangle when one point is in a , is really greater than when it is on the circumference, though the same in the limit; hence

$$M_1 > \frac{1}{3}M;$$

$$\therefore (M' - M)A > aM;$$

$$\therefore M'/(A+a) > M/A.$$

Therefore, if we consider infinitesimals of the second order, the chance of a re-entrant figure is increased by the addition of the space a to the circle. It will be an exercise for the reader to verify this when the space is subtracted.

For an ellipse, being derived by projection from the circle, the probability is the same, and a minimum.

It is pretty certain that a triangle will be found to be the contour which gives the probability the greatest.

Mr. Woolhouse has given (*Educ. Times*, Dec., 1867) the values of p for

	Triangle.	Parallelogram.	Reg. Hexagon.	Circle.
$p =$	$\frac{1}{3}$ or .3333	$\frac{11}{30}$.3666	$\frac{33}{100}$.2973	$\frac{35}{12\pi^2}$.2955

73. Many questions may be made to depend upon the four-point problem. Thus, if two points A, B are taken at random in a given convex area, to find the chance that two others C, D , also taken at random, shall lie on opposite sides of the line AB .

Let p be the chance that $ABCD$ is re-entrant. If it is, the chance is easily seen to be $\frac{1}{2}$ that any two of the four lie on opposite sides of the line joining the two others. If $ABCD$ is convex, the same chance is $\frac{1}{2}$; hence the required probability is

$$\omega = \frac{1}{2}p + \frac{1}{2}(1-p) = \frac{1}{2}p.$$

Or we might proceed as follows, e.g., in the case of a triangle:

The sides of the triangle ABC (Fig. 5) produced divide the whole triangle into seven spaces. Of these, the mean value of those marked a is the same, viz., the mean value of ABC , or $\frac{1}{3}$ of the triangle, as we have shown—the mean value of those marked β being $\frac{2}{3}$ of the triangle.

This is easily seen: for instance, if the whole area $= i$, the mean value of the space PBQ gives the chance that if the fourth point D be taken at random B shall fall within the triangle ADC ; now the mean value of ABC gives the chance

FIG. 5.

that D shall fall within ABC; but these two chances are equal. Hence we see that if A, B, C be taken at random, the mean value of that portion of the whole triangle which lies on the same side of AB as C does is $\frac{1}{3}$ of the whole, and that of the opposite portion is $\frac{1}{3}$. Hence the chance of C and D falling on opposite sides of AB is $\frac{1}{4}$.

74. We can give but few of the innumerable questions depending on the position of points in a plane, or in space. Some may be solved without any aid from the integral calculus, by using a few very evident subsidiary principles. As an instance, we will state the following two propositions, and proceed to apply them to one or two questions.

(1) In a triangle ABC, the frequency of any direction for the line CX is the same when X is a point taken at random on the base AB as when X is taken at random in the area of the triangle.

(2) If X (Fig. 6) is a point taken at random in the triangle ABb (Bb being infinitesimal), the frequency of the distance AX is the same as that of AZ, Y and Z being two points taken at random in AB, and Z denoting always that one of the two which is nearest to B. For the frequency in each case is proportional to the distance AX or AZ.

Let us apply these to the following question:

A point O is taken at random in a triangle (Fig. 7); if n more points are taken at random, to find the chance that they shall lie on some one of the three triangles AOB, AOC, BOC.

If C be joined with all the points in question, every joining line is equally likely to be nearest to CB. Hence the chance that all the n points fall on the triangle ACD is

$$(n+1)^{-1}.$$

If this is so, we have to find the chance that all lie on AOC. Now if O range over the infinitesimal triangle CDd, we may, by principle (2) above, suppose it to be the nearest to D of two points taken at random in CD. If so, the chance that AO is nearer to AD than any of the lines from A to the n points is

$$2(n+2)^{-2};$$

for, by (1) above, we may suppose all the points taken at random in CD; now any one of the $n+2$ is equally likely to be the last; and O is the last of the two additional points. Hence, if O is in the triangle CDd, the chance that the n points fall on AOC is

$$2(n+1)^{-1}(n+2)^{-1};$$

therefore this is the chance wherever O falls in ABC.

Therefore the required chance that the n points fall on some one of the triangles AOB, AOC, BOC is

$$P=6(n+1)^{-1}(n+2)^{-1}.$$

Again, if O be taken at random in the triangle, and three more points X, Y, Z, be also taken at random in it, to find the chance that they shall fall, one on each of the triangles AOB, AOC, BOC.

First, two of the points are to fall on one of the triangles ACD, BCD, and the remaining one on the other; say two on ACD, the chance of this is $\frac{1}{2}$, as CO must then be the third in order of the four distances from C. If this is so, the chance that the point X in BCD falls on BOC is $\frac{1}{3}$. For, as above, if O ranges over the triangle CDd, we may take it to be the lowest of two points taken at random on CD; and the chance that, if another point be also taken at random in CD, it shall be lower than O is $\frac{1}{2}$. Now if one of the points X is in BOC, the frequency of O in CDd will be the same as that of the lowest of three points taken on CD; and the chance that one of the remaining points shall fall in AOC and the other in AOD is the chance that O, the lowest of three particular points out of five, all taken at random in CD, shall be the fourth in order from C. It is easy to see that this chance is $\frac{1}{4}$. Hence the chance that one point falls on BOC, one on AOC, and the third on AOD is

$$\frac{1}{4} \cdot \frac{1}{3} \cdot \frac{1}{2} = \frac{1}{24}.$$

And it will be the same for the case where the third falls

on BOD. Hence the chance that one point falls on each of the three triangles above is double this, or $\frac{1}{12}$.

75. *Straight lines falling at Random on a Plane.*—If an infinite number of straight lines be drawn at random in a plane, there will be as many parallel to any given direction as to any other, all directions being equally probable; also those having any given direction will be disposed with equal frequency all over the plane. Hence, if a line be determined by the coördinates p, ω , the perpendicular on it from a fixed origin O, and the inclination of that perpendicular to a fixed axis, then, if p, ω be made to vary by equal infinitesimal increments, the series of lines so given will represent the entire series of random straight lines. Thus the number of lines for which p falls between p and $p+dp$, and ω between ω and $\omega+d\omega$, will be measured by $dpd\omega$, and the integral

$$\iint dpd\omega,$$

between any limits, measures the number of lines within those limits.

It is easy to show from this that the number of random lines which meet any closed convex contour of length L is measured by L . For, taking O inside the contour, and integrating first for p , from 0 to p , the perpendicular on the tangent to the contour, we have $\int pd\omega$; taking this through four right angles for ω , we have by Legendre's theorem on rectification, N being the measure of the number of lines,

$$N = \int_0^{2\pi} \int_0^p pd\omega = L^2.$$

Thus, if a random line meet a given contour, of length L , the chance of its meeting another convex contour, of length l , internal to the former, is

$$p = l/L.$$

If the given contour be not convex, or not closed, N will evidently be the length of an endless string, drawn tight around the contour.

76. If a random line meet a closed convex contour, of length L , the chance of its meeting another such contour, external to the former is

FIG. 8.

them, and Y that of a band also enveloping both, but not crossing. This may be shown by means of Legendre's integral above; or as follows:

Call, for shortness, $N(A)$ the number of lines meeting area A ; $N(A, A')$ the number which meet both A and A' ; then (Fig. 8)

$$N(SROQPH) + N(S'Q'OR'P'H') = N(SROQPH + S'Q'OR'P'H') + N(SROQPH, S'Q'OR'P'H'),$$

since in the first member each line meeting both areas is counted twice. But the number of lines meeting the non-convex figure consisting of OQPHSR and OQ'S'H'P'R' is equal to the band Y, and the number meeting both these areas is identical with that of these meeting the given areas Ω, Ω' ; hence

$$X = Y + N(\Omega, \Omega').$$

1 This result also follows by considering that, if an infinite plane be covered by an infinity of lines drawn at random, it is evident that the number of these which meet a given finite straight line is proportional to its length, and is the same whatever be its position. Hence, if we take l the length of the line as the measure of this number, the number of random lines which cut any element ds of the contour is measured by ds , and the number which meet the contour is therefore measured by $\frac{1}{2} L$, half the length of the boundary. If we take $2l$ as the measure for the line, the measure for the contour will be L , as above. Of course we have to remember that each line must meet the contour twice. It would be possible to rectify any closed curve by means of this principle. Suppose it traced on the surface of a circular disk, of circumference L , and the disk thrown a great number of times on a system of parallel lines, whose distance asunder equals the diameter, if we count the number of cases in which the closed curve meets one of the parallels, the ratio of this number to the whole number of trials will be ultimately the ratio of the circumference of the curve to that of the circle.

Thus the number meeting both the given areas is measured by $X - Y$. Hence the theorem follows.

77. Two random chords cross a given convex boundary, of length L , and area Ω ; to find the chance that their intersection falls inside the boundary.

Consider the first chord in any position; let C be its length; considering it as a closed area, the chance of the second chord meeting it is

$$2C/L;$$

and the whole chance of its coördinates falling in $dp, d\omega$ and of the second chord meeting it in that position is

$$\frac{2C}{L} \frac{dp d\omega}{\iint dp d\omega} = \frac{2}{L^2} C dp d\omega.$$

But the whole chance is the sum of these chances for all its positions;

$$\therefore \text{prob.} = 2L^{-2} \iint C dp d\omega.$$

Now, for a given value of ω , the value of $\int C dp$ is evidently the area Ω ; then, taking ω from π to 0 , required probability $= 2\pi\Omega L^{-2}$.

The mean value of a chord drawn at random across the boundary is

$$M = \frac{\iint C dp d\omega}{\iint dp d\omega} = \frac{\pi\Omega}{L}.$$

78. A straight band of breadth c being traced on a floor, and a circle of radius r thrown on it at random; to find the mean area of the band which is covered by the circle. (The cases are omitted where the circle falls outside the band).¹

If S be the space covered, the chance of a random point on the circle falling on the band is

$$p = M(S)/\pi r^2.$$

This is the same as if the circle were fixed, and the band thrown on it at random. Now let A (Fig. 9) be a position of the random point; the favorable cases are when HK , the bisector of the band, meets a circle, centre A , radius $\frac{1}{2}c$; and the whole number are when HK meets a circle, centre O , radius $r + \frac{1}{2}c$; hence the probability is

$$p = \frac{2\pi \cdot \frac{1}{2}c}{2\pi(r + \frac{1}{2}c)} = \frac{c}{2r + c}.$$

This is constant for all positions of A ; hence, equating these two values of p , the mean value required is

$$M(S) = c(2r + c)^{-1}\pi r^2.$$

The mean value of the portion of the circumference which falls on the band is the same fraction $\frac{c}{2r + c}$ of the whole circumference.

If any convex area whose surface is Ω and circumference L be thrown on the band, instead of a circle, the mean area covered is

$$M(S) = \pi c(L + \pi c)^{-1}\Omega.$$

For as before, fixing the random point at A , the chance of a random point in Ω falling on the band is

$$p = 2\pi \cdot \frac{1}{2}c/L,$$

where L' is the perimeter of a parallel curve to L , at a normal distance $\frac{1}{2}c$ from it. Now

$$\frac{L'}{L} = \frac{L + 2\pi \cdot \frac{1}{2}c}{L}.$$

$$\therefore \frac{M(S)}{\Omega} = \frac{\pi c}{L + \pi c}.$$

79. Buffon's problem may be easily deduced in a similar manner. Thus, if $2r$ = length of line, a = distance between the parallels, and we conceive a circle (Fig. 10) of diameter a with its centre at the middle O of the line,² rigidly attached to the latter, and thrown with it on the parallels, this circle must meet one of the parallels; if it be thrown an infinite number of times, we shall thus have an infinite number of chords crossing it at random. Their num-

FIG. 10.

¹ Or the floor may be supposed painted with parallel bands, at a distance asunder equal to the diameter; so that the circle must fall on one.

² The line might be anywhere within the circle without altering the question.

ber is measured by $2\pi \cdot \frac{1}{2}a$, and the number which meet $2r$ is measured by $4r$. Hence the chance that the line $2r$ meets one of the parallels is

$$p = 4r/\pi a.$$

80. To investigate the probability that the inclination of the line joining any two points in a given convex area Ω shall lie within given limits. We give here a method of reducing this question to calculation, for the sake of an integral to which it leads, and which is not easy to deduce otherwise.

First let one of the points A (Fig. 11) be fixed; draw through it a chord $PQ = C$, at an inclination θ to some fixed line; put $AP = r$, $AQ = r'$; then the number of cases for which the direction of the line joining A and B lies between θ and $\theta + d\theta$ is measured by

$$\frac{1}{2}(r^2 + r'^2)d\theta.$$

Now let A range over the space between PQ and a parallel chord distant dp from it, the number of cases for which A lies in this space and the direction of AB is from θ to $\theta + d\theta$ is (first considering A to lie in the element $dr dp$)

$$\frac{1}{2} dp d\theta \int_0^C (r^2 + r'^2) dr = \frac{1}{2} C^3 dp d\theta.$$

Let p be the perpendicular on C from a given origin O , and let ω be the inclination of p (we may put $d\omega$ for $d\theta$), C will be a given function of p, ω ; and, integrating first for ω constant, the whole number of cases for which ω falls between given limits ω', ω'' is

$$\frac{1}{2} \int_{\omega'}^{\omega''} d\omega \int C^3 dp;$$

the integral $\int C^3 dp$ being taken for all positions of C between two tangents to the boundary parallel to PQ . The question is thus reduced to the evaluation of this double integral, which, of course, is generally difficult enough; we may, however, deduce from it a remarkable result; for, if the integral

$$\frac{1}{2} \iint C^3 dp d\omega$$

be extended to all possible positions of C , it gives the whole number of pairs of positions of the points A, B which lie inside the area; but this number is Ω^2 ; hence

$$\iint C^3 dp d\omega = 3\Omega^2,$$

the integration extending to all possible positions of the chord C —its length being a given function of its coördinates p, ω .

COR. Hence if L, Ω be the perimeter and area of any closed convex contour, the mean value of the cube of a chord drawn across it at random is $3\Omega^2/L$.

81. Let there be any two convex boundaries (Fig. 12) so related that a tangent at any point V to the inner cuts off a constant segment S from the outer (e.g., two concentric similar ellipses); let the annular area between them be called A ; from a point X taken at random on this annulus draw tangents XA, XB to the inner. Find the mean value of the arc AB . We shall find

$$M(AB) = LS/A,$$

L being the whole length of the inner curve ABV .

We will first prove the following lemma:

If there be any convex arc AB (Fig. 13), and if N_1 be (the measure of) the number of random lines which meet it once, N_2 the number which meet it twice,

$$2 \text{ arc } AB = N_1 + 2N_2.$$

For draw the chord AB ; the number of lines meeting the convex figure so formed is

$$N_1 + N_2 = \text{arc} + \text{chord (the perimeter)};$$

but N_1 = the number of lines meeting the chord = 2 chord;

$$\therefore 2 \text{ arc} + N_1 = 2N_1 + 2N_2, \therefore 2 \text{ arc} = N_1 + 2N_2.$$

³ This integral was given by the present writer in the *Comptes Rendus*, 1869, p. 1469. An analytical proof was given by Serret, *Annales scient. de l'École Normale*, 1869, p. 177.

Now fix the point X and draw XA, XB. If a random line cross the boundary L, and p_1 be the probability that it meets the arc AB once, p_2 that it does so twice,

$$2AB/L = p_1 + 2p_2;$$

and if the point X range all over the annulus, and p_1, p_2 are the same probabilities for all positions of X,

$$2M(AB)/L = p_1 + 2p_2.$$

Let now IK (Fig. 14) be any position of the random line; drawing tangents at I, K, it is easy to see that it will cut the arc AB twice when X is in the space marked α , and once when X is in either space marked β ; hence, for this position of the line,

$$p_1 + 2p_2 = \frac{2\alpha + 2\beta}{A} = \frac{2S}{A}, \text{ which is constant; hence}$$

$$\frac{M(AB)}{L} = \frac{S}{A}.$$

Hence the mean value of the arc is the same fraction of the perimeter that the constant area S is of the annulus.

If L be not related as above to the outer boundary,

$$M(AB)/L = M(S)/A,$$

M(S) being the mean area of the segment cut off by a tangent at a random point on the perimeter L.

The above result may be expressed as an integral. If s be the arc AB included by tangents from any point (x, y) on the annulus,

$$\iint s dx dy = LS.$$

It has been shown (*Phil. Trans.*, 1868, p. 191) that, if θ be the angle between the tangents XA, XB,

$$\iint \theta dx dy = \pi(A - 2S).$$

The mean value of the tangent XA or XB may be shown to be

$$M(XA) = \frac{S}{2A} P,$$

where P = perimeter of locus of centre of gravity of the segment S.

82. If C be the length of a chord crossing any convex area Ω ; Σ, Σ' the areas of the two segments into which it divides the area; and p, ω the coordinates of C, viz., the perpendicular on C from any fixed pole, and the angle made by p with any fixed axis; then

$$\iint C^2 dp d\omega = 6 \iint \Sigma \Sigma' dp d\omega,$$

both integrations extending to all possible values of p, ω which give a line meeting the area.

This identity will follow by proving that, if ρ be the distance between two points taken at random in the area, the mean value of ρ will be

$$M(\rho) = \Omega^{-2} \iint \Sigma \Sigma' dp d\omega \quad \dots \quad (1),$$

and also

$$M(\rho) = \frac{1}{6} \Omega^{-2} \iint C^2 dp d\omega \quad \dots \quad (2).$$

The first follows by considering that, if a random line crosses the area, the chance of its passing between the two points is $2L^{-1}M(\rho)$, L being the perimeter of Ω . Again, for any given position of the random line C, the chance of the

FIG. 15.

two points lying on opposite sides of it is $2\Sigma\Sigma'\Omega^{-2}$; therefore, for all positions of C, the chance is $2\Omega^{-2}M(\Sigma\Sigma')$; but the mean value $M(\Sigma\Sigma')$, for all positions of the chord, is

$$M(\Sigma\Sigma') = \frac{\iint \Sigma \Sigma' dp d\omega}{\iint dp d\omega} = \frac{1}{L} \iint \Sigma \Sigma' dp d\omega.$$

To prove equation (2), we remark that the mean value of ρ is found by supposing each of the points A, B to occupy in succession every possible position in the area, and dividing the sum of their distances in each case by the whole number of cases, the measure of which number is Ω^2 . Confining our attention to the cases in which the inclination of the distance AB to some fixed direction lies between θ and $\theta + d\theta$, let the position of A be fixed (Fig. 15), and draw through it a chord HH' = C, at the inclination θ ; the sum of the cases found by giving B all its positions is

$$d\theta \int_0^r \rho \cdot \rho d\rho + d\theta \int_0^{r'} \rho \cdot \rho d\rho = \frac{1}{2}(\tau^3 + \tau'^3) d\theta,$$

where $r = AH$, $r' = AH'$. Now let A occupy successively all positions between HH' and hh', a chord parallel to it at a distance = dp ; the sum of all the cases so given will be

$$\frac{1}{2} d\theta dp \int_0^C (\tau^3 + \tau'^3) d\tau = \frac{1}{2} d\theta dp \frac{1}{2} C^4 = \frac{1}{4} d\theta dp C^4.$$

Now, if A moves over the whole area, the sum of the cases will be

$$\frac{1}{4} d\theta \int C^4 dp,$$

where p = perpendicular on C from any fixed pole O, and the integration extends to all parallel positions of C between two tangents T, T' to the boundary, the inclination of which is θ . Removing now the restriction as to the direction of the distance AB, and giving it all values from 0 to π , the sum of all the cases is

$$\frac{1}{8} \int_0^\pi d\theta \int C^4 dp;$$

or, if ω = inclination of p , $d\omega = d\theta$, and the sum is

$$\frac{1}{8} \iint C^4 dp d\omega.$$

The mean value of the reciprocal of the distance AB of two points taken at random in a convex area is easily shown to be

$$M\rho^{-1} = \Omega^{-2} \iint C^2 dp d\omega.$$

Thus, for a circle, $M\rho^{-1} = \frac{16}{3\pi r}.$

It may also be shown that the mean area of the triangle formed by taking three points A, B, C within any convex area is

$$M(ABC) = \Omega - \Omega^{-2} \iint C^2 \Sigma^2 dp d\omega.$$

83. In the last question if we had sought for the mean value of the chord HH' or C, which joins A and B, the sum of the cases when A is fixed and the inclination lies between θ and $\theta + d\theta$ would have been

$$C \cdot \frac{1}{2}(\tau^2 + \tau'^2) d\theta,$$

and when A lies between HH' and hh'

$$\frac{1}{2} C d\theta dp \int_0^C (\tau^2 + \tau'^2) d\tau = \frac{1}{2} d\theta dp C^3;$$

and finally, the mean value of C is

$$M(C) = \frac{1}{8} \Omega^{-2} \iint C^3 dp d\omega.$$

Thus the mean value of a chord, passing through two points taken at random within any convex boundary, is double the mean distance of the points.

84. We have now done enough to give the reader some idea of the subject of local probability. We refer him for fuller information to the very interesting work just published by Emanuel Czuber of Prague, *Geometrische Wahrscheinlichkeiten und Mittelwerte*, Leipzig, 1884; also to the *Educational Times Journal*, in which most of the recent theorems on the subject have first appeared in the form of questions, under the able editorship of Mr. Miller, who has himself largely contributed. In Williamson's *Integral Calculus*, and a paper by Prof. Crofton, *Phil. Trans.*, 1868, the subject is also treated.

Literature.—Besides the works named in the course of this article, see De Morgan's treatise in the *Encyclopædia Metropolitana*; Laurent, *Traité du Calcul des Probabilités*, Paris, 1873; Gourand, *Histoire du Calcul des Prob.*, Paris, 1848; J. W. L. Glaisher, "On the Law of Facility of Errors of Observations, and the Method of Least Squares," *Trans. R.A.S.*, vol. xxxix.; Cournot, *Théorie des Chances*; Lagrange, *Calcul des Prob.*; General Diction, *Calcul des Prob. appliqué au tir des projectiles*. Those who are interested in the metaphysical aspect of the question may consult Boole's *Laws of Thought*, also J. S. Mill's *Logic*. To these and the other works we have named we refer the reader for an account of what we have had to omit, but above all, to the great work of Laplace, of which it is sufficient to say that it is worthy of the genius of its author—the *Théorie analytique des Probabilités*. It is no light task to master the methods and the reasonings there employed; but it is, and will long continue to be, one that must be attempted by all who desire to understand and to apply the theory of probability. (M. W. C.)

PROBATE. See WILL.

PROBUS, MARCUS AURELIUS, Roman emperor from 276 to 282 A.D., was a native of Sirmium on the Save, and son of a military officer of moderate fortune. He early entered the army, where he recommended himself to the emperor Valerian, and against all rule became tribune while still a mere lad. In these times there were abundant opportunities for a capable officer, and Probus served with great distinction in all parts of the empire. Under Aurelian he operated against the Palmyrene realm in Egypt and had a large part in the restoration of Roman authority in the East. On Aurelian's death he was quite the most prominent military officer of Rome and had a great hold on the troops by his constant care for their comfort, his judicious discipline, and his unselfishness. Tacitus is said to have hesitated to assume the purple which Probus was betterfitted to wear, and it is certain that he felt the support of Probus indispensable, and raised him to the rank of commander of the whole East. In a few months the purple actually fell to him, for on the news of Tacitus's death his soldiers at once made him emperor, Florianus, who had claimed to succeed his brother, was put to death by his own troops, and the senate were eager to ratify the choice of the army. The reign of Probus was mainly spent in successful wars by which he re-established the security of all the frontiers; the fiercest and most bloody of these operations was directed to clearing Gaul of the Germans. Probus had also to put down three usurpers, Saturninus, Proculus, and Bonosus. One of his principles was never to allow the soldiers to be idle, and to employ them in time of peace on useful works, such as the planting of vineyards in Gaul, Pannonia, and other districts where a selfish policy had previously forbidden this form of husbandry. This increase of duties was naturally unpopular with the troops, and while the emperor was urging on the draining of the marshes of his native place he was attacked and slain by a sudden mutiny. Scarcely any emperor has left behind him so good a reputation; his death was mourned alike by senate and people, and even the soldiers presently repented and raised a monument in honor of "Probus imperator vere probus." According to the *Chron. Alex.* Probus was fifty years old at the time of his death; he left a family, but they withdrew into private life in northern Italy, and the empire fell to Carus.

PROCESS, in law, denotes in the widest sense of the word any means by which a court of justice gives effect to its authority. In the old practice of the English common law courts process was either original or judicial. Original process was a means of compelling a defendant to compliance with an original writ (see WRIT). Judicial process was any compulsory proceeding rendered necessary after the appearance of the defendant. Process was also divided in civil matters into original, mesne, and final. Original process in this sense was any means taken to compel the appearance of the defendant. A writ of summons is now the universal means in the High Court of Justice. Mesne process was either any proceeding against the defendant taken between the beginning and the end of the action, such as to compel him to give bail, or was directed to persons not parties to the action, such as jurors or witnesses. Arrest on mesne process was abolished in England by the Debtors Act, 1869. Final process is practically coexistent with execution. It includes writs of *feri facias*, *capias*, *elegit*, sequestration, and attachment. In criminal matters process only applies where the defendant does not appear upon summons or otherwise. A warrant is now the usual form of such process. Service of process on Sunday is void, except in cases of treason, felony, or breach of the peace, 29 Car. II., c. 7. Recent legislation gives facilities for service and execution of certain kinds of process of the courts of one part of the United Kingdom in another part. Thus by 44 & 45 Vict. c. 24, process of an English court of summary jurisdiction

may be served in Scotland, and *vice versa*. A writ of summons in the High Court of Justice may be served out of the jurisdiction in certain cases (*Rules of the Supreme Court*, 1883, Ord. xi.).

Stet processus was a technical term used in old common law practice. It consisted of an entry on the record by consent of the parties for a stay of proceedings. Since the Judicature Acts there has been no record, and the *stet processus* has disappeared with it.

In Scotch law process is used in a much wider sense, almost equivalent to practice or procedure in English law. Process in the English sense corresponds rather to diligence. Where papers forming steps of a process are borrowed and not returned, diligence of process caption lies for their recovery.

In the United States process is governed by numerous statutes, both of Congress and of the State legislatures. The law is founded upon the English common law.

PROCIDA, an island less than 2 miles off the west coast of southern Italy between Capo Miseno (or rather Monte Procida) on the mainland and the island of Ischia, forming part of the circondario of Pozzuoli and the province of Naples. Its total area is not much more than 1½ square miles, but it is fertile, well-cultivated, and thickly peopled (10,788 inhabitants in 1871, 10,891 in 1881). Like the neighboring mainland it is largely of volcanic origin, and the ancient Greek name Prochyte (Πρόχυτη), Latinized as Procita, possibly refers to this fact. The two fine bays on the south coast are remains of craters, and the soil is almost exclusively tuff. The coasts are usually a rocky scarp; the general surface of the island is comparatively low and flat. Procida, the chief town, lies on the isthmus of a peninsula, at the landward extremity, looking out over a spacious bay. It contains a castle, now used as a prison, and an old royal palace of the Bourbons, who had a hunting park in the island; and the harbor is defended by a fort. In the Piazza dei Martiri is a monument to the twelve who were executed as political offenders in 1799. The islanders are mainly engaged in market-gardening, vine-growing, the fisheries, and the coasting trade; but the number of fishing-boats belonging to Procida is much smaller than it used to be. In accordance with their claim to be of Greek descent the women are accustomed to wear on the festival of St. Michael a picturesque Greek costume and to dance the tarantula.

In the 13th century the island was the feudal possession of Giovanni da Procida, the chief conspirator in the Sicilian Vespers. The capture off the coast, by the Ottoman fleet, of a number of Andrea Doria's galleys in 1522 was the last of many instances in which Procida was made to realize the hostility of Mohammedan powers. In 1799, from 1806 to 1809, and again in 1813 it was occupied by the English.

PROCLUS. See NEOPLATONISM.

PROCONSUL. See CONSUL, vol. vi. p. 280, and PROVINCE.

PROCOPIUS, the most eminent historian of the Eastern Roman Empire, was born at Cæsarea in Palestine, then one of the chief cities of the Roman East, towards the end of the 5th century, probably between 485 and 495 A.D. Of his family and earlier life nothing is known, but it has been plausibly conjectured from the aristocratic sympathies he manifests that he belonged to one of the better families of his city, and from the place of his birth that he was educated at the great law school of Berytus (Beirut). He became a lawyer, probably at Constantinople, and was in 526 appointed σύμβουλος to Belisarius, who was proceeding to command the imperial army in the war against the Persians (Proc., *Pers.*, i. 12). The chief duties of this office, which is also described as that of *πατέρος* or *συγκάθεδρος*, seem to have been the giving of legal advice to the general, who had a measure of judicial as well as administrative power, and have been well compared by Mr. Hodgkin (*Italy and Her Invaders*, vol. iii. p. 638) to those of an English judge advocate. When the Persian War was suspended Procopius probably returned with his general to Constantinople; and

when Belisarius was despatched against the Vandals of Africa in 533 Procopius again accompanied him, as he subsequently did in the war against the Ostrogoths of Italy which began in 536. Whether he held the same position of legal assessor through these campaigns or was merely a member of the large personal following which Belisarius had we do not know. Suidas calls him the secretary (*ὑπογραφεὺς*) of Belisarius, but this may be merely a reference to his original appointment as *σύμβουλος* in the Persian campaign. He was evidently much valued by Belisarius, who twice employed him on difficult and important missions—once in 533 to obtain from Syracuse provisions for the Roman fleet and information as to the preparations of the Vandals, and again in 537, when the historian was despatched from Rome, which Belisarius was holding against the Goths, to collect troops and corn in Campania and bring them in a fleet to Ostia. On both occasions Procopius acquitted himself with skill and success. He passes lightly over his own performances, and nowhere strikes us as eager for an opportunity of singing his own praises.

After the capture of Ravenna in 539 Procopius would seem to have returned to Constantinople, where he was in 542, the year of the great plague, which he has minutely described (*Pers.*, ii. 22). It does not appear whether he was with the Roman armies in the later stages of the Gothic War, when Belisarius and afterwards Narses fought against Totila in Italy, though his narrative of these years is so much less full and minute than that of the earlier warfare that probably he was not an eye-witness of these campaigns. Of his subsequent fortunes we know nothing, except that he was living in 559. He was an advocate by profession (Agathius, Evagrius, and other Byzantine writers call him *ρήτωρ*), but whether he practiced law after his return from the Italian wars may be doubted, for he must have been then occupied with the composition of his histories, and his books show that he spent a good deal of time in travel. He seldom refers to legal matters, and shows little interest in them, mentioning only in the most cursory way the legislation and codification of Justinian. Whether he was the Procopius who was prefect of Constantinople in 562 (Theophanes, *Chronographia*, 201, 202) and was removed from office in the year following cannot be determined. Little can be founded on the name, for it was a common one in that age, and had this Procopius been our historian one might have expected some of the subsequent writers who refer to the latter to have mentioned this fact about him. On the other hand the historian was evidently a person of note, who had obtained the rank of *Illustis* (Suidas calls him *Ἰλλουστριος*), and a passage in the *Anecdota* looks as if he had risen to be a senator (*Anecd.*, c. 12), so that there is no improbability in his having been raised to the high office of prefect.

There has been some controversy as to his religion. So far as external profession went, he must have been a Christian; for paganism, persecuted by Justinian, would hardly have been tolerated in so conspicuous a person; nor is there any evidence for his being a heathen other than the cool indifference with which (except in the *De Edificiis*) he speaks about Christian beliefs and practices. He seems to have been so far a Christian as to have believed in a God and have held Christ to be a supernatural being, but he frequently expresses himself in skeptical language, talks of God and Fate as if practically synonymous, and entertained great contempt for the theological controversies which raged so hotly in his own time.

Procopius's writings fall into three divisions—the *Histories* (Persian, Vandal, and Gothic Wars) in eight books, the treatise on the *Buildings of Justinian* (*De Edificiis*) in six books, and the *Unpublished Memoirs* (*τὰ Ἀνέκδοτα*, *Historia Arcana*), here cited as the *Anecdota*.

The *Histories* are called by the author himself the

Books about the Wars (*οἱ ὑπὲρ τῶν πολέμων λόγοι*). They consist of—(1) the Persian wars, in two books, giving a narrative of the long struggle of the emperors Justin and Justinian against the Persian kings Kobad and Chosroes Anushirvan down to 550; (2) the Vandal War, in two books, describing the conquest of the Vandal kingdom in Africa and the subsequent events there from 532 down to 546 (with a few words on later occurrences); (3) the Gothic War, in four books, narrating the war against the Ostrogoths in Sicily and Italy from 536 to 552. These three treatises were written continuously to form one connected history; but, as the arrangement of events is geographical, not chronological, they overlap in time, the Persian War carrying its narrative over a large part of the period embraced in the Vandal War and the Gothic War. The fourth and last of the four books of the Gothic War is really a general history of the empire, designed to continue the Persian War as well as the Gothic. It was written after the year in which the preceding seven books had been published and was itself published apparently in 554 or 555. These eight books of *Histories*, although mainly occupied with military matters, contain notices of some of the more important domestic events, such as the Nika insurrection at Constantinople in 532, the plague in 542, the conspiracy of Artabanus in 548. They tell us, however, comparatively little about the civil administration of the empire, and nothing about legislation. On the other hand they are rich in geographical and ethnographical information, often of the highest value for our knowledge of the barbarian and particularly of the Teutonic tribes who lived on the borders of the empire and were either its enemies or the material of its armies.

As an historian, Procopius would have deserved honor in any age, and is of quite unusual merit when one considers the generally low literary level of the age which produced him. From the 4th to the 15th century the Eastern empire has no lay writer of gifts approaching his. He is industrious in collecting facts, careful and impartial in stating them; his judgment is sound, his reflections generally acute, his conceptions of the general march and movement of things not unworthy of the great events he has recorded. His descriptions, particularly of military operations, are clear, and his especial fondness for this part of the subject seldom leads him into unnecessary minuteness. The style, although marked by mannerisms, by occasional affectations and rhetorical devices, is on the whole direct and business-like, nor is the Greek bad, when one considers the time. Thucydides and Herodotus are the two models whom he keeps always before his eyes; he imitates the former in the maxims (*γνώμαι*) he throws in, and the speeches which he puts into the mouth of the chief actors; the latter in his frequent geographical digressions, in the personal anecdotes, in the tendency to collect and attach some credence to marvellous tales. It need hardly be said that he falls far short of the vigor and profundity of the Attic, as well as of the genial richness, the grace, the simplicity, the moral elevation, the poetical feeling of the Ionic historian. The speeches are obviously composed by Procopius himself, rarely showing any dramatic variety in their language, but they seem sometimes to convey the substance of what was said, and even when this is not the case they frequently serve to bring out the points of a critical situation. The geographical and ethnological notices are precious. Procopius is almost as much a geographer as an historian—it is one of his merits to have perceived the importance of each science to the other—and his descriptions of the peoples and places he himself visited are generally careful and thorough. Although a warmly patriotic Roman, he does full justice to the merits of the barbarian enemies of the empire, and particularly of the Ostrogoths; although the subject of a despotic prince, he criticises the civil and military administration of Justinian and his deal-

ings with foreign peoples with a freedom which gives a favorable impression of the tolerance of the emperor. His chief defects are a somewhat pretentious and at the same time monotonous style, and a want of sympathy and intensity which prevents him from giving full life and reality to the personages who figure in his narrative, or raising it to a level worthy of the great and terrible scenes which he has sometimes to describe.

The *De Edificiis*, or treatise on the Buildings of Justinian, contains an account of the chief public works executed during the reign of the emperor down to 558, in which year it seems to have been composed, particularly churches, palaces, hospitals, fortresses, roads, bridges and other river works. All these are of course ascribed to the personal action of the monarch. The treatise is a little longer than the average length of one single book of the eight books of the *Histories*. Its arrangement is geographical; beginning from Constantinople, it describes works executed in the Mesopotamian provinces, in Armenia and the Caucasian countries, in Thrace and Macedonia, in Asia Minor and Syria, in Egypt and Africa as far as the Pillars of Hercules. If not written at the command of Justinian (as some have supposed), it is at any rate semi-official, being evidently grounded on official information, and is full of gross flattery of the emperor and of the (then deceased) empress. In point of style it is greatly inferior to the *Histories*—florid, pompous, and affected, and at the same time tedious. Its chief value lies in the geographical notices which it contains.

The *Anecdota*, or Secret History, in length almost equal to the *De Edificiis*, and somewhat shorter than the average length of a book of the *Histories*, purports to be a supplement to these, containing explanations and additions which the author could not place in the *Histories* for fear of Justinian and Theodora. It is a furious invective against these sovereigns, their characters, personal conduct, and government, with attacks on Belisarius and his wife Antonina, and on other official persons of note in the civil and military services of the empire—attacks whose effect is weakened by the passion the author betrays. Frequent references to the *Histories* are interspersed, but the events of the wars are seldom referred to, the main topic being the personal and official misdeeds of the rulers as shown in domestic affairs. The ferocity and brutality of this scandalous chronicle astonish us, for modern writings of the same order have usually been the work of vulgar and anonymous scribblers, not of an able, accomplished, and highly placed man such as Procopius was. Hence its authenticity has been often called in question, and a few words are needed both on that question and on the further question of the credibility of its contents.

It was unknown to Agathias and Evagrius, younger contemporaries of Procopius who frequently mention his *Histories*, and is first referred to by Suidas (writing in the 10th century), who ascribes it to Procopius. Two MSS. (since lost) are mentioned as having been brought to Italy in the days of the Renaissance, but the first publication was made by Nicholas Alemanni, an official of the Vatican, who found a MS. in that library and edited it with copious and learned notes and a Latin translation (Lyons, 1623). Since his day several jurists (led thereto by jealousy for Justinian's reputation) and other scholars have denied it to be the work of Procopius, among whom it is sufficient to refer to the latest, J. H. Reinkens.¹ The external argument against its genuineness, drawn from its not being mentioned till four centuries after the death of Procopius, appears weak when we recollect that it was obviously not written to be published at the time, and may well have remained concealed for generations. The internal argument from the difference between the view of Justinian it presents and that given in the *De Edificiis* will impress no one who has observed the almost patent insincerity of the latter book, and the

censure, severe though carefully guarded, which the *Histories* frequently bestow on Justinian's policy. On the other hand the agreement in many points of fact between the *Histories* and the *Anecdota*, and the exactness of the references from the latter to the former, point to unity of authorship; while the similarity of opinions, ideas, beliefs, prejudices, and still more the similarities of literary manner, style, and language, supply an overwhelming body of evidence that the *Anecdota* are a genuine, and so far as his deep-seated feelings go the most genuine, work of Procopius. The question, which ought never to have been deemed doubtful, has been set at rest by the careful comparison of the use of words and phrases in the acknowledged works of Procopius and in the *Anecdota*, which we owe to the industry of Dr. Felix Dahn, and which is set forth in his excellent book mentioned at the close of this article. It is less easy to pronounce on the credibility of the picture which the *Anecdota* give of the court and government of Justinian. Plainly there are many exaggerations and some absurdities; yet, when we find some of the severest statements of the book confirmed by other annalists and others substantially tallying with or explaining those made by Procopius himself in the *Histories*, we are led to conclude that there is a substantial basis of fact for the charges it brings. It is of course often difficult, sometimes impossible, to say what deductions must be made from the form these charges take; but after studying the book closely one becomes rather less than more sceptical.

In point of style, the *Anecdota* are inferior to the *Histories*, and have the air of being unfinished or at least unrevised. Their merit lies in the furious earnestness with which they are written, and which gives them a force and reality sometimes wanting in the more elaborate books written for publication.

The character of a man who could revenge himself for having been obliged to bestow gross flattery on his sovereign by ferocious invective meant to be launched after his death inspires little respect. Otherwise Procopius is a favorable specimen of his age. He is patriotic, with a strong feeling for the greatness of the empire, its dignity, the preservation of its ancient order. He is a worshipper of the past, whose ideal is such a government as that of Trajan or Hadrian. His ethical standard is scarcely affected by Christianity, but is that of a Greek of classical times, with too great a tolerance of deceit when practiced against barbarian enemies, and doubtless also with a deficient sense of honor and personal independence. Yet his patriotism does not prevent him from doing justice to the valor of the Persians, or the still finer qualities of the Goths as he had learnt to know them in Italy. He is, however, frigid in sentiment as well as in style, and throws little geniality into his narratives and descriptions. In his attitude towards the unseen world he is at once skeptical and superstitious—skeptical in that he speaks with equal hesitation about the practices and doctrines of different faiths, and declares his persuasion that nothing more can be known about God than that He is all-wise and all-powerful; superstitious in his readiness to accept all kinds of marvels, omens, prophecies, apparitions, and to find in the sudden changes of human affairs the action of a spiteful fortune which delights to startle men and confound their schemes. Procopius has little philosophy in his history; he is a vague and inconsistent thinker, and is strongest when he is describing events or facts, or drawing such direct inferences from them as strike an acute man of the world.

The best edition of Procopius is that by Dindorf in the *Corpus Scriptorum Historiæ Byzantine*, 3 vols., Bonn, 1833–38. The best criticisms and examinations of his writings are those by W. S. Teuffel, in his *Studien und Charakteristiken zur Literaturgeschichte*, Leipzig, 1871; and F. Dahn, *Procopius von Cæsarea*, Berlin, 1865. (J. BR.)

PROCOPIUS. Two leaders of this name are men-

¹ *Anecdota sintne scripta a Procopio Cæsariensi inquiritur*, Breslau, 1858.

tioned in connection with the wars of the HUSSITES (*q.v.*).

I. ANDREAS PROCOPIUS, surnamed "the Great" or "the Bald," was a native of Bohemia, born about 1380. He had travelled extensively in Europe, and had even visited Jerusalem before he received priestly orders. On the outbreak of the Hussite War he joined Ziska, and was chosen to succeed him after his death in 1425. From 1426 onwards he met with a succession of military successes in Austria, Moravia, Silesia, and Hungary which compelled various potentates to purchase peace, and disposed even the council of Basel to a spirit of compromise. Procopius and his "Taborites" were, however, dissatisfied with the "Compactata" which the "Calixtines" accepted, and resolved to carry on the contest. He perished in the decisive battle fought near Böhmisschbrod on May 30, 1434.

II. Of PROCOPIUS surnamed "the Little" nothing is known save that he co-operated with Procopius "the Great" from 1427 onwards, and that he shared his fate.

PROCTER, BRYAN WALLER (1787-1874), poet and miscellaneous writer, was born on the 21st November, 1787. At an early age he was sent to a small boarding school near London, and thence in his thirteenth year to Harrow, where he had for contemporaries Lord Byron and Sir Robert Peel. On leaving school he was placed in the office of a solicitor at Calne, Wiltshire, remaining there until about 1807, when he returned to pursue his legal studies in London. By the death of his father in 1816 he became possessed of a small property, and soon after entered into partnership with a solicitor; but in 1820 the partnership was dissolved, and during the temporary difficulties thus occasioned he supported himself in part by literary work under the pseudonym of Barry Cornwall. After his marriage in 1824 to Miss Skepper, a daughter of Mrs. Basil Montagu, he returned to his professional work as conveyancer, and was called to the bar in 1831. In the following year he was appointed metropolitan commissioner of lunacy—an appointment annually renewed until his election to the permanent commission constituted by the Act of 1842. He resigned office in 1861. During the last years of his life a failure of speech led him to withdraw increasingly from society, and his death took place on October 4, 1874. The period of his poetic productiveness had closed many years previously, the larger proportion of his verse having been composed between 1815, when he began to contribute to the *Literary Gazette*, and 1823, or at latest 1832.

His principal works in the verse form were—*Dramatic Scenes and other Poems* (1819), *A Sicilian Story* (1820), *Mirandola*, a tragedy performed at Covent Garden with Macready, Charles Kemble, and Miss Foote in the leading parts (1821), *The Flood of Thessaly* (1823), and *English Songs* (1832). He was also the author of *Effigies Poetica* (1824), *Life of Edmund Keane* (1835), *Essays and Tales in Prose* (1851), *Charles Lamb; a Memoir* (1866), and of memoirs of Ben Jonson and Shakespeare for editions of their works. A posthumous autobiographical fragment with notes of his literary friends, of whom he had a wide range from Bowles to Browning, was published in 1877. His genius cannot be said to have been entirely mimetic, but his works are full of subdued echoes. His songs have caught some notes from the Elizabethan and Cavalier lyrics, and blended them with others from the leading poets of his own time; and his dramatic fragments show a similar infusion of the early Victorian spirit into pre-Restoration forms and cadences. The results are somewhat heterogeneous, and without the impress of a pervading and dominant personality to give them unity, but they abound in pleasant touches, with here and there the flash of a higher, though casual inspiration.

His daughter, ADELAIDE ANNE PROCTER (1825-1864), also attained some distinction as a poet, her principal works being her *Legends and Lyrics*, of which a first series, published in 1858, ran through nine editions in seven years, and a second series issued in 1860 met with a similar success. Her unambitious verses dealing with simple emotional themes in a simple manner have a charm which is scarcely explicable on the ground of high literary merit,

but which is due rather to the fact that they are the cultured expression of an earnest and beneficent life. Latterly she became a convert to Roman Catholicism, and her philanthropic zeal appears to have hastened her death, which took place February 3, 1864.

PROCTOR, the English form of the Latin *procurator*, denotes a person who acts for another, and so approaches very nearly in meaning to AGENT (*q.v.*). The word is used in three senses. (1) A particular kind of university official. (2) A representative of the clergy in convocation. A proctor represents either the chapter of a cathedral or the beneficed clergy of a diocese. In the province of Canterbury two proctors represent the clergy of each diocese; in that of York there are two for each archdeaconry. In both alike each chapter is represented by one. (3) A practitioner in the ecclesiastical and admiralty courts. A proctor is a qualified person licensed by the archbishop of Canterbury to undertake duties such as are performed in other courts by solicitors. The word in this sense is now only of historical interest. The effect of recent legislation is that all the business formerly confined to proctors may now be conducted by solicitors. The instrument by which a procurator or proctor is appointed is called a *proxy*, a term also applied to the representative himself. Proxies are still in use in bankruptcy and in some of the Vice-Admiralty Courts. Formerly peers could give their vote in parliament by proxy, but this right was discontinued by the standing order of March 31, 1868. A shareholder in a joint-stock company may vote by proxy. A proxy must, by the Stamp Act, 1870, bear a penny stamp.

There are no proctors in the United States. In Scotland the original term procurator is used to denote a law agent who practices in an inferior court. A procurator has been, since the Law Agents Act, 1873, exactly in the same legal position as other law agents. The procurator-fiscal is a local officer charged with the prosecution of crimes. He is appointed by the sheriff. He also performs the duties of an English coroner by holding inquiries into the circumstances of suspicious deaths.

PRODICUS of Ceos, whose birth is conjecturally assigned to 465-460 B.C., was a humanist of the first period of the Sophistical movement. He was still living in 399 B.C. Visiting Athens, in the first instance (it is said) as the accredited agent of his native island, he became known in the intellectual capital as a good speaker and a successful teacher. Like Protagoras, he professed to train his pupils for domestic and civic affairs; but it would appear that, while Protagoras's chief instruments of education were rhetoric and style, Prodicus made ethics prominent in his curriculum. As a moralist he seems to have been orthodox, neither impugning nor developing traditional notions. In his literary teaching he laid special stress upon distinctions in the use of words. The Platonic Socrates (as well as Aristophanes) speaks of Prodicus with a certain respect, earned perhaps by his simple though conventional morality; but it is easy to see that Plato thought him affected and pedantic, and did not rank him either with Protagoras as a thinker or with Gorgias as a stylist. Two of Prodicus's discourses were especially famous: one, "on propriety of language," is repeatedly alluded to by Plato; the other, entitled *ῥῆμα*, contained the celebrated apologue of the choice of Heracles, of which the Xenophontean Socrates (*Mem.*, ii. 1, 21 *sq.*) gives a summary. Thera-menies, Euripides, and Isocrates are said to have been pupils or hearers of Prodicus. For some personal traits, and a caricature of his teaching, see Plato's *Protagoras*, 315 C *sq.*, 337 A *sq.*

On the Sophistical movement, as well as for bibliographical information, see SOPHISTS.

PROHIBITION is defined by Blackstone as if a writ directed to the judge and parties of a suit in any inferior court, commanding them to cease from the prosecution thereof, upon a surmise either that the cause originally or some collateral matter arising therein

does not belong to that jurisdiction, but to the cognizance of some other court." A writ of prohibition is a prerogative writ—that is to say, it does not issue as of course, but is granted only on proper grounds being shown. Before the Judicature Acts prohibition was granted by one of the Superior Courts at Westminster; it also issued in certain cases from the Court of Chancery. It is now granted by the High Court of Justice. Up to 1875 the High Court of Admiralty was for the purposes of prohibition an inferior court. But now by the Judicature Act, 1873, 36 & 37 Vict. c. 66, § 24, it is provided that no proceeding in the High Court of Justice or the Court of Appeal is to be restrained by prohibition, a stay of proceedings taking its place where necessary. The Admiralty Division being now one of the divisions of the High Court can therefore no longer be restrained by prohibition. The courts to which it most frequently issues in the present day are the ecclesiastical courts, and county and other local courts, such as the Lord Mayor's Court of London, the Court of Passage of the city of Liverpool, and the Court of Record of the hundred of Salford. In the case of courts of quarter sessions, the same result is generally obtained by *certiorari*. The extent to which the ecclesiastical courts were restrainable by prohibition led to continual disputes for centuries between the civil and ecclesiastical authorities. Attempts were made at different times to define the scope of the writ, the most conspicuous instances being the statute *Circumspecte Agatis*, 13 Edw. I. st. 4; the *Articuli Cleri*, 9 Edw. II. st. 1; and the later *Articuli Cleri* of 3 Jac. I., consisting of the claims asserted by Archbishop Bancroft and the reply of the judges. The law seems to be undoubted that the spiritual court acting in spiritual matters *pro salute animæ* cannot be restrained. The difficulties arise in the application of the principle to individual cases.

Prohibition lies either before or after judgment. In order that proceedings should be restrained after judgment it is necessary that want of jurisdiction in the inferior court should appear upon the face of the proceedings, that the party seeking the prohibition should have taken his objection in the inferior court, or that he was in ignorance of a material fact. A prohibition goes either for excess of jurisdiction, as if an ecclesiastical court were to try a claim by prescription to a pew, or for transgression of clear laws of procedure, as if such a court were to require two witnesses to prove a payment of tithes. It will not as a rule be awarded on a matter of practice. The remedy in such a case is appeal. Nor will it go, unless in exceptional cases, at the instance of a stranger to the suit. The procedure in prohibition is partly common law, partly statutory. By 50 Edw. III. c. 4, prohibition is not to be awarded after consultation, *i.e.*, after the judges of the superior court have remitted the case as within the jurisdiction of the inferior court. 1 Will. IV. c. 21 (an Act to improve the proceedings in prohibition and on writs of mandamus) was repealed as to England by 46 & 47 Vict. c. 49, but it still applies to Ireland, to which it was extended by 9 & 10 Vict. c. 113. Application for a prohibition is usually made *ex parte* to a judge in chambers on affidavit. The application may be granted or refused. If granted, a rule to show cause why a writ of prohibition should not issue goes to the inferior judge and the other party. In prohibition to courts other than county courts pleadings in prohibition may be ordered. These pleadings are as far as possible assimilated to pleadings in actions. They are rare in practice, and are only ordered in cases of great difficulty and importance. In prohibition to county courts they cannot be ordered, 19 & 20 Vict. c. 108, § 42. Further statutory regulations as to prohibition to county courts are contained in §§ 40, 41, and 44 of the same Act, and in 13 & 14 Vict. c. 61, § 22. Much learning on the subject of prohibition will be found in the opinion of Mr. Justice Wills delivered to the House of Lords in The

Mayor and Aldermen of London v. Cox (*Law Reports*, 2 Eng. and Ir. Appeals, 239).

In Scotch law prohibition is not used in the English sense. The same result is obtained by suspension or reduction. In the United States the supreme court has power to issue a prohibition to the district courts when proceeding as courts of admiralty and maritime jurisdiction. Most of the States have also their own law upon the subject, generally giving power to the supreme judicial authority in the State to prohibit courts of inferior jurisdiction.

PROJECTILES. See **MECHANICS** (vol. xv. pp. 689 sq., 714 sq.) and **GUNNERY**, vol. xi. 268 sq.

PROJECTION. If from a fixed point *S* in space lines or rays be drawn to different points *A, B, C, . . .* in space, and if these rays are cut by a plane in points *A', B', C', . . .* the latter are called the projections of the given points on the plane. Instead of the plane another surface may be taken, and then the points are projected to that surface instead of to a plane. In this manner any figure, or plane in space of three dimensions, may be projected to any surface from any point which is called the centre of projection. If the figure projected is in three dimensions then this projection is the same as that used in what is generally known as *perspective*.

In modern mathematics the word *projection* is often taken with a slightly different meaning, supposing that plane figures are projected into plane figures, but three-dimensional ones into three-dimensional figures. Projection in this sense, when treated by coördinate geometry, leads in its algebraical aspect to the theory of linear substitution and hence to the theory of invariants and covariants.

In this article projection will be treated from a purely geometrical point of view.

We shall first and principally treat of the projection of plane figures into plane figures, and consider a number of special cases due to special positions of the two planes or of the centre of projection. We shall next consider the representation of figures of three dimensions by plane figures (orthographic projections, drawing in plan and elevation, etc.), then treat of perspective in its ordinary sense, and speak shortly of projections to curved surfaces.

References like (G. § 87) relate to section II. of the article **GEOMETRY**, vol. x. pp. 346 sq.

§ 1. **PROJECTION OF PLANE FIGURES.**—Let us suppose we have in space two planes π and π' . In the plane π a figure is given having known properties; then we have the problem to find its projection from some centre *S* to the plane π' , and to deduce from the known properties of the given figure the properties of the new one.

If a point *A* is given in the plane π we have to join it to the centre *S* and find the point *A'* where this ray *SA* cuts the plane π' ; it is the projection of *A*. On the other hand if *A'* is given in the plane π' , then *A* will be its projection in π . Hence if one figure in π' is the projection of another in π , then conversely the latter is also the projection of the former.

A point and its projection are therefore also called corresponding points, and similarly we speak of corresponding lines and curves, etc.

§ 2. We at once get the following properties:

The projection of a point is a point, and one point only.

The projection of a line (straight line) is a line; for all points in a line are projected by rays which lie in the plane determined by *S* and the line, and this plane cuts the plane π' in a line which is the projection of the given line.

If a point lies in a line its projection lies in the projection of the line.

The projection of the line joining two points *A, B* is the line which joins the projections *A', B'* of the points *A, B*. For the projecting plane of the line *AB* contains the rays *SA, SB* which project the points *A, B*.

The projection of the point of intersection of two lines *a, b* is the point of intersection of the projections *a', b'* of those lines.

Similarly we get—

The projection of a curve will be a curve.

The projections of the points of intersection of two curves are the points of intersection of the projections of the given curves.

If a line cuts a curve in *n* points, then the projection of the line cuts the projection of the curve in *n* points. Or

The order of a curve remains unaltered by projection.

The projection of a tangent to a curve is a tangent to the projection of the curve. For the tangent is a line which has two coincident points in common with a curve.

The number of tangents that can be drawn from a point to a curve remains unaltered by projection. Or

The class of a curve remains unaltered by projection.

Example.—The projection of a circle is a curve of the second order and second class.

§ 3. Two figures of which one is a projection of the other obtained in the manner described may be moved out of the position in which they are obtained. They are then still said to be one the projection of the other, or to be projective or homographic. But when they are in the position originally considered they are said to be in perspective position, or (shorter) to be perspective.

All the properties stated in §§ 1, 2, hold for figures which are projective, whether they are perspective or not. There are others which hold only for projective figures when they are in perspective position, which we shall now consider.

If two planes π and π' are perspective, then their line of intersection is called the axis of projection. Any point in this line coincides with its projection. Hence

All points in the axis are their own projections. Hence also Every line meets its projection on the axis.

The property that the lines joining corresponding points all pass through a common point, that any pair of corresponding points and the centre are in a line, is also expressed by saying that the figures are co-linear; and the fact that both figures have a line, the axis, in common on which corresponding lines meet is expressed by saying that the figures are co-axial.

The connection between these properties has to be investigated.

For this purpose we consider in the plane π a triangle ABC, and let the lines BC, CA, AB be denoted by a, b, c . The projection will consist of three points A', B', C' and three lines a', b', c' . These have such a position that the lines AA', BB', CC' meet in a point, viz., at S, and the points of intersection of a and a', b and b', c and c' lie on the axis (by § 2). The two triangles therefore are said to be both co-linear and co-axial. Of these properties either is a consequence of the other, as will now be proved.

§ 4. DESARGUE'S THEOREM.—If two triangles, whether in the same plane or not, are co-linear they are co-axial. Or

If the lines AA', BB', CC' joining the vertices of two triangles meet in a point, then the intersections of the sides BC and $B'C'$, CA and $C'A'$, AB and $A'B'$ are three points in a line. Conversely,

If two triangles are co-axial they are co-linear. Or

If the intersection of the sides of two triangles ABC and $A'B'C'$, viz., of BC and $B'C'$, of CA and $C'A'$, and of AB and $A'B'$, lie in a line, then the lines $AA', BB',$ and CC' meet in a point.

Proof.—Let us first suppose the triangles to be in different planes. By supposition the lines AA', BB', CC' (Fig. 1) meet in a point S. But three intersecting lines determine three planes, SBC, SCA, and SAB. In the first lie the points B, C and also B', C' . Hence the lines BC and $B'C'$ will intersect at some point P, because any two lines in the same plane intersect. Similarly CA and $C'A'$ will intersect at some point Q, and AB and $A'B'$ at some point R. These points P, Q, R lie in the plane of the triangle ABC because they are points on the sides of this triangle, and similarly in the plane of the triangle $A'B'C'$. Hence they lie in the intersection of two planes,—that is, in a line.

Secondly, If the triangles ABC and $A'B'C'$ lie both in the same plane the above proof does not hold. In this case we may consider the plane figure as the projection of the figure in space of which we have just proved the theorem. Let ABC, $A'B'C'$ be the co-linear triangles with S as centre, so that AA', BB', CC' meet at S. Take now any point in space, say your eye E, and from it draw the rays projecting the figure. In the line ES take any point S_1 , and in EA, EB, EC take points A_1, B_1, C_1 respectively, but so that S_1, A_1, B_1, C_1 are not in a plane. In the plane ESA which projects the line S_1A_1 lie then the line S_1A_1 and also EA' ; these will therefore meet in a point A'_1 , of which A' will be the pro-

jection. Similarly points B'_1, C'_1 are found. Hence we have now in space two triangles $A_1B_1C_1$ and $A'_1B'_1C'_1$ which are co-linear. They are therefore co-axial, that is, the points P_1, Q_1, R_1 , where A_1B_1 , etc., meet will lie in a line. The projections therefore lie in a line. But these are the points P, Q, R, which were to be proved to lie in a line.

This proves the first part of the theorem. The second part or converse theorem is proved in exactly the same way. For another proof see (G. § 37).

§ 5. By aid of Desargue's theorem we can now prove a fundamental property of two projective planes.

Let s be the axis, S the centre, and let A, A' and B, B' be two pairs of corresponding points which we suppose fixed, and C, C' any other pair of corresponding points. Then the triangles ABC and $A'B'C'$ are co-axial, and they will remain co-axial if the one plane π' be turned relative to the other about the axis. They will therefore, by Desargue's theorem, remain co-linear, and the centre will be the point S', where AA' meets BB' . Hence the line joining any pair of corresponding points C, C' will pass through the centre S'. The figures are therefore perspective. This will remain true if the planes are turned till they coincide, because Desargue's theorem remains true.

THEOREM.—If two planes are perspective, then if the one plane be turned about the axis through any angle, especially if the one plane be turned till it coincides with the other, the two planes will remain perspective; corresponding lines will still meet on a line called the axis, and the lines joining corresponding points will still pass through a common centre S situated in the plane.

Whilst the one plane is turned this point S will move in a circle whose centre lies in the plane π , which is kept fixed, and whose plane is perpendicular to the axis.

The last part will be proved presently. As the plane π' may be turned about the axis in one or the opposite sense, there will be two perspective positions possible when the planes coincide.

§ 6. Let (Fig. 2) π, π' be the planes intersecting in the

FIG. 2.

axis s , whilst S is the centre of projection. To project a point A in π we join A to S and see where this line cuts π' . This gives the point A' . But if we draw through S any line parallel to π , then this line will cut π' in some point I' , and if all lines through S be drawn which are parallel to π these will form a plane parallel to π which will cut the plane π' in a line i' parallel to the axis s . If we say that a line parallel to a plane cuts the latter at an infinite distance, we may say that all points at an infinite distance in π are projected into points which lie in a straight line i' , and conversely all points in the line are projected to an infinite distance in π , whilst all other points are projected to finite points. We say therefore that all points in the plane π at an infinite distance may be considered as lying in a straight line, because their projections lie in a line. Thus we are again led to consider points at infinity in a plane as lying in a line (comp. G. §§ 2-4).

Similarly there is a line j in π which is projected to infinity in π' ; this projection shall be denoted by j' so that i' and j' are lines at infinity.

§ 7. If we suppose through S a plane drawn perpendicular to the axis s cutting it at T, and in this plane the two lines SI' parallel to π and SJ parallel to π' , then the lines through I' and J parallel to the axis will be the lines i' and j . At the same time a parallelogram $SJTT'S$ has been formed. If now the plane π' be turned about the axis, then the points I' and J will not move in their planes; hence the lengths TJ and TI' , and therefore also SI' and SJ , will not change. If the plane π is kept fixed in space the point J will remain fixed, and S describes a circle about J as centre and with SJ as radius. This proves the last part of the theorem in § 5.

§ 8. The plane π' may be turned either in the sense indicated by the arrow at Z or in the opposite sense till π' falls into π . In the first case we get a figure like Fig. 3; i' and j will be on the same side of the axis, and on this side will also lie the centre S; and then $ST = SJ + SI'$ or $SI' = JT, SJ = IT$. In the second case (Fig. 4) i' and j will be on opposite sides of the axis, and the centre S will lie between them in such a position that $I'S = TJ$, and $I'T = SJ$. If $I'S = SJ$, the point S will lie on the axis.

It follows that any one of the four points S, T, J, I' is completely determined by the other three: if the axis, the centre and one of the lines i' or j are given the other is

FIG. 3.

FIG. 4.

determined; the three lines s, i', j , determine the centre; the centre and the lines i', j determine the axis.

§ 9. We shall now suppose that the two projective planes π, π' are perspective and have been made to coincide.

THEOREM.—If the centre, the axis and either one pair of corresponding points on a line through the centre or one pair of corresponding lines meeting on the axis are given, then the whole projection is determined.

Proof.—If A and A' (Fig. 1) are given corresponding points, it has to be shown that we can find to every other point B the corresponding point B' . Join AB to cut the axis in R . Join RA' ; then B' must lie on this line. But it must also lie on the line SB . Where both meet is B' . That the figures thus obtained are really projective can be seen by aid of Desargue's theorem. For, if for any point C the corresponding point C' be found, then the triangles ABC and $A'B'C'$ are, by construction, co-linear, hence co-axial; and s will be the axis, because AB and AC meet their corresponding lines $A'B'$ and $A'C'$ on it. BC and $B'C'$ therefore also meet on s .

If on the other hand, a, a' are given corresponding lines, then any line through S will cut them in corresponding points, A, A' which may be used as above.

§ 10. Rows and pencils which are projective or perspective have been considered in the article GEOMETRY (G. §§ 12-40). All that has been said there holds, of course, here for any pair of corresponding rows or pencils. The centre of perspective for any pair of corresponding rows is at the centre of projection S , whilst the axis contains coincident corresponding elements. Corresponding pencils on the other hand have their axis of perspective on the axis of projection whilst the coincident rays pass through the centre.

We mention here a few of those properties which are independent of the perspective position:

The correspondence between two projective rows, or pencils, is completely determined if to three elements in one the corresponding ones in the other are given. If for instance in two projective rows three pairs of corresponding points are given, then we can find to every other point in either the corresponding point (G. §§ 29-36).

If A, B, C, D are four points in a row and A', B', C', D' the corresponding points, then their cross-ratios are equal $(ABCD) = (A'B'C'D')$ —where $(ABCD) = AC/BC : AD/BD$.

If in particular the point D lies at infinity we have $(ABCD) = -AC/BC = AC/BC$. If therefore the points D and D' are both at infinity we have $AC/BC = AD/BD$, and the rows are similar (G. § 39). This can only happen in special cases. For the line joining corresponding points passes through the centre; the latter must therefore lie at infinity if D, D' are different points at infinity. But if D and D' coincide they must lie on the axis, that is, at the point of infinity of the axis unless the axis is altogether at infinity.

Hence—In two perspective planes every row which is parallel to the axis is similar to its corresponding row, and in general no other row has this property.

But if the centre or the axis is at infinity then every row is similar to its corresponding row.

In either of these two cases the metrical properties are particularly simple. If the axis is at infinity the ratio of similitude is the same for all rows and the figures are similar. If the centre is at infinity we get parallel projection; and the ratio of similitude changes from row to row (see §§ 16, 17).

In both cases the mid-points of corresponding segments will be corresponding points.

§ 11. INVOLUTION.—If the planes of two projective figures coincide, then every point in their common plane has to be counted twice, once as a point A in the figure π , once as a point B' in the figure π' . The points A' and B corresponding to them will in general be different points; but it may happen that they coincide. Here a theorem holds similar to that about rows (G. §§ 76 sq.).

THEOREM.—If two projective planes coincide, and if it happens that to one point in their common plane the same point corresponds, whether we consider the point as belonging to the first or to the second plane, then the same will happen for every other point—that is to say, to every point will correspond the same point in the first as in the second plane.

In this case the figures are said to be in involution.

Proof.—Let (Fig. 5) S be the centre, s the axis of projection, and let a point which has the name A in the first plane and B' in the second have the property that the points A' and B corresponding to them again coincide. Let C and D' be the names which some other point has in the two planes. If the line AC cuts the axis in X , then the point where the line XA' cuts SC' will be the point C' corresponding to C (§ 9). The line $B'D'$ also cuts the axis in X and

FIG. 5.

therefore the point D corresponding to D' is the point where XB cuts SD' . But this is the same point as C' . Q.E.D.

This point C' might also be got by drawing CB and joining its intersection Y with the axis to B' . Then C' must be the point where $B'Y$ meets SC . This figure, which now forms a complete quadrilateral, shows that in order to get involution the corresponding points A and A' have to be harmonic conjugates with regard to S and the point T where AA' cuts the axis.

THEOREM.—If two perspective figures are in involution, two corresponding points are harmonic conjugates with regard to the centre and the point where the line joining them cuts the axis. Similarly—

Any two corresponding lines are harmonic conjugates with regard to the axis and the line from their point of intersection to the centre.

Conversely—If in two perspective planes one pair of corresponding points are harmonic conjugates with regard to the centre and the point where the line joining them cuts the axis, then every pair of corresponding points has this property and the planes are in involution.

§ 12. PROJECTIVE PLANES WHICH ARE NOT IN PERSPECTIVE POSITION.—We return to the case that two planes π and π' are projective but not in perspective position, and state in some of the more important cases the conditions which determine the correspondence between them. Here it is of great advantage to start with another definition which, though at first it may seem to be of far greater generality, is in reality equivalent to the one given before.

DEFINITION.—We call two planes projective if to every point in one corresponds a point in the other, to every line a line, and to a point in a line a point in the corresponding line, in such a manner that the cross-ratio of four points in a line, or of four rays in a pencil, is equal to the cross-ratio of the corresponding points or rays.

The last part about the equality of cross-ratios can be proved to be a consequence of the first. But as space does not allow us to give an exact proof for this we include it in the definition.

If one plane is actually projected to another we get a correspondence which has the properties required in the new definition. This shows that a correspondence between two planes conforming to this definition is possible. That it is also definite we have to show. It follows at once that—

Corresponding rows, and likewise corresponding pencils, are projective in the old sense (G. §§ 25, 30). Further,

If two planes are projective to a third they are projective to each other.

THEOREM.—The correspondence between two projective planes π and π' is determined if we have given either two rows u, v in π and the corresponding rows u', v' in π' , the point where u and v meet corresponding to the points where u' and v' meet, or two pencils, U, V' , in π' , the ray UV joining the centres of the pencils in π corresponding to the ray $U'V'$.

It is sufficient to prove the first part. Let any line a cut u, v in the points A and B . To these will correspond points A' and B' in u' and v' which are known. To the line a corresponds then the line $A'B'$. Thus to every line in the one plane the corresponding line in the other can be found, hence also to every point the corresponding point.

§ 13. **THEOREM.**—If the planes of two projective figures coincide, and if either four points, of which no three lie in a line, or

else four lines, of which no three pass through a point, in the one coincide with their corresponding points, or lines, in the other, then every point and every line coincides with its corresponding point or line so that the figures are identical.

If the four points A, B, C, D coincide with their corresponding points, then every line joining two of these points will coincide with its corresponding line. Thus the lines AB and CD, and therefore also their point of intersection E, will coincide with their corresponding elements. The row AB has thus three points A, B, E coincident with their corresponding points, and is therefore identical with it (§ 10). As there are six lines which join two and two of the four points A, B, C, D, there are six lines such that each point in either coincides with its corresponding point. Every other line will thus have the six points in which it cuts these, and therefore all points, coincident with their corresponding points. The proof of the second part is exactly the same. It follows—

§ 14. *If two projective figures which are not identical lie in the same plane, then not more than three points which are not in a line, or three lines which do not pass through a point, can be coincident with their corresponding points or lines.*

If the figures are in perspective position, then they have in common one line, the axis, with all points in it, and one point, the centre, with all lines through it. No other point or line can therefore coincide with its corresponding point or line without the figures becoming identical.

It follows also that—

The correspondence between two projective planes is completely determined if there are given—either to four points in the one the corresponding four points in the other provided that no three of them lie in a line, or to any four lines the corresponding lines provided that no three of them pass through a point.

To show this we observe first that two planes π , π' may be made projective in such a manner that four given points A, B, C, D in the one correspond to four given points A', B', C', D' in the other; for to the lines AB, CD will correspond the lines A'B' and C'D', and to the intersection E of the former the point E' where the latter meet. The correspondence between these rows is therefore determined, as we know three pairs of corresponding points. But this determines a correspondence (by § 12). To prove that in this case and also in the case of § 12 there is but one correspondence possible, let us suppose there were two, or that we could have in the plane π' two figures which are each projective to the figure in π and which have each the points A'B'C'D' corresponding to the points ABCD in π . Then these two figures will themselves be projective and have four corresponding points coincident. They are therefore identical by § 13.

THEOREM.—*Two projective planes will be in perspective position if one row coincides with its corresponding row. The line containing these rows will be the axis of projection.*

Proof.—As in this case every point on s coincides with its corresponding point, it follows that every row a meets its corresponding row a' on s where corresponding points are united. The two rows a , a' are therefore perspective (G. § 30), and the lines joining corresponding points will meet in a point S. If r be any one of these lines cutting a , a' in the points A and A' and the line s at K, then to the line AK corresponds A'K, or the ray r corresponds to itself. The points B, B' in which r cuts another pair b , b' of corresponding rows must therefore be corresponding points. Hence the lines joining corresponding points in b and b' also pass through S. Similarly all lines joining corresponding points in the two planes π and π' meet in S; hence the planes are perspective.

The following proposition is proved in a similar way:

THEOREM.—*Two projective planes will be in perspective position if one pencil coincides with its corresponding one. The centre of these pencils will be the centre of perspective.*

In this case the two planes must of course coincide, whilst in the first case this is not necessary.

§ 15. We shall now show that two planes which are projective according to definition § 12 can be brought into perspective position, hence that the new definition is really equivalent to the old. We use the following property: If two coincident planes π and π' are perspective with S as centre, then any two corresponding rows are also perspective with S as centre. This therefore is true for the rows j and j' and for i and i' , of which i' and j' are the lines at infinity in the two planes. If now the plane π' be made to slide on π so that each line moves parallel to itself, then the point at infinity in each line, and hence the whole line at infinity in π' remains fixed. So does the point at infinity on j , which thus remains coincident with its corresponding point on j' , and therefore the rows j and j' remain perspective, that is to say the rays joining corresponding points in them meet at some point T. Similarly the lines joining corresponding points in i and i' will meet in some point T'. These two points T and T' originally coincided with each other and with S.

Conversely, if two projective planes are placed one on the other, then as soon as the lines j and i' are parallel the two points T and T' can be found by joining corresponding points in j and j' , and also in i and i' . If now a point at infinity is called A as a point in π and B' as a point in π' , then the point A' will lie on i' and B on j , so that the line AA' passes through T' and BB' through T. These two lines are parallel. If then the plane π' be moved parallel to itself till T' comes to T, then these two lines will coincide with each other, and with them will coincide the lines AB and A'B'. This line and similarly every line through T will thus now coincide with its corresponding line. The two planes are therefore according to the last theorem in § 14 in perspective position.

It will be noticed that the plane π' may be placed on π in two different ways, viz., if we have placed π' on π we may take it off and turn it over in space before we bring it back to π , so that what was its upper becomes now its lower face. For each of these positions we get one pair of centres T, T', and only one pair, because the above process must give every perspective position. It follows—

In two projective planes there are in general two and only two pencils in either such that angles in one are equal to their corresponding angles in the other. If one of these pencils is made coincident with its corresponding one, then the planes will be perspective.

This agrees with the fact that two perspective planes in space can be made coincident by turning one about their axis in two different ways (§ 8).

In the reasoning employed it is essential that the lines j and i' are finite. If one lies at infinity, say j , then i and j coincide, hence their corresponding lines i' and j' will coincide; that is, i' also lies at infinity, so that the lines at infinity in the two planes are corresponding lines. If the planes are now made coincident and perspective, then it may happen that the lines at infinity correspond point for point, or can be made to do so by turning the one plane in itself. In this case the line at infinity is the axis, whilst the centre may be a finite point. This gives similar figures (see § 16). In the other case the line at infinity corresponds to itself without being the axis; the lines joining corresponding points therefore all coincide with it, and the centre S lies on it at infinity. The axis will be some finite line. This gives parallel projection (see § 17). For want of space we do not show how to find in these cases the perspective position, but only remark that in the first case any pair of corresponding points in π and π' may be taken as the points T and T', whilst in the other case there is a pencil of parallels in π such that any one line of these can be made to coincide point for point with its corresponding line in π' , and thus serve as the axis of projection. It will therefore be possible to get the planes in perspective position by first placing any point A' on its corresponding point A and then turning π' about this point till lines joining corresponding points are parallel.

§ 16. **SIMILAR FIGURES.**—If the axis is at infinity every line is parallel to its corresponding line. Corresponding angles are therefore equal. The figures are similar, and (§ 10) the ratio of similitude of any two corresponding rows is constant.

If similar figures are in perspective position they are said to be similarly situated, and the centre of projection is called the centre of similitude. To place two similar figures in this position, we observe that their lines at infinity will coincide as soon as both figures are put in the same plane, but the rows on them are not necessarily identical. They are projective, and hence in general not more than two points on one will coincide with their corresponding points in the other (G. § 34). To make them identical it is either sufficient to turn one figure in its plane till three lines in one are parallel to their corresponding lines in the other, or it is necessary before this can be done to turn the one plane over in space. It can be shown that in the former case all lines are, or no line is, parallel to its corresponding line, whilst in the second case there are two directions, at right angles to each other, which have the property that each line in either direction is parallel to its corresponding line. We also see that—

If in two similar figures three lines, of which no two are parallel, are parallel respectively to their corresponding lines, then every line has this property and the two figures are similarly situated; or

Two similar figures are similarly situated as soon as two corresponding triangles are so situated.

If two similar figures are perspective without being in the same plane, their planes must be parallel as the axis is at infinity. Hence

Any plane figure is projected from any centre to a parallel plane into a similar figure.

If two similar figures are similarly situated, then corre-

spending points may either be on the same or on different sides of the centre. If, besides, the ratio of similitude is unity, then corresponding points will be equidistant from the centre. In the first case therefore the two figures will be identical. In the second case they will be identically equal but not coincident. They can be made to coincide by turning one in its plane through two right angles about the centre of similitude S . The figures are in involution, as is seen at once, and they are said to be *symmetrical with regard to the point S as centre*. If the two figures be considered as part of one, then this is said to have a centre. Thus regular polygons of an even number of sides and parallelograms have each a centre, which is a centre of symmetry.

§ 17. PARALLEL PROJECTION.—If, instead of the axis, the centre be moved to infinity, all the projecting rays will be parallel, and we get what is called *Parallel Projection*. In this case the line at infinity passes through the centre and therefore corresponds to itself,—but not point for point as in the case of similar figures. To any point I at infinity corresponds therefore a point I' also at infinity but different from the first. Hence to parallel lines meeting at I correspond parallel lines of another direction meeting at I' . Further, in any two corresponding rows the two points at infinity are corresponding points; hence the rows are similar. This gives the principal properties of parallel projection:

To parallel lines correspond parallel lines; or
To a parallelogram corresponds a parallelogram.

The correspondence of parallel projection is completely determined as soon as for any parallelogram in the one figure the corresponding parallelogram in the other has been selected, as follows from the general case in § 14.

Corresponding rows are similar (§ 10).

The ratio of similitude for these rows changes with the direction:

If a row is parallel to the axis, its corresponding row, which is also parallel to the axis, will be equal to it, because any two pairs AA' and BB' of corresponding points will form a parallelogram.

Another important property is the following:

The areas of corresponding figures have a constant ratio.

We prove this first for parallelograms. Let $ABCD$ and $EFGH$ be any two parallelograms in π , $A'B'C'D'$ and $E'F'G'H'$ the corresponding parallelograms in π' . Then to

FIG. 6.

the parallelogram $KLMN$ which lies (Fig. 6) between the lines AB , CD and EF , GH will correspond a parallelogram $K'L'M'N'$ formed in exactly the same manner. As $ABCD$ and $KLMN$ are between the same parallels, their areas are as the bases. Hence

$$\frac{ABCD}{KLMN} = \frac{AB}{KL} \text{ and similarly } \frac{A'B'C'D'}{K'L'M'N'} = \frac{A'B'}{K'L'}$$

But $AB/KL = A'B'/K'L'$, as the rows AB and $A'B'$ are similar. Hence

$$\frac{ABCD}{A'B'C'D'} = \frac{KLMN}{K'L'M'N'} \text{ and similarly } \frac{EFGH}{E'F'G'H'} = \frac{KLMN}{K'L'M'N'}$$

Hence also

$$\frac{ABCD}{A'B'C'D'} = \frac{EFGH}{E'F'G'H'}$$

This proves the theorem for parallelograms and also for their halves, that is, for any triangles. As polygons can be divided into triangles the truth of the theorem follows at once for them, and is then by the well-known method of exhaustion extended to areas bounded by curves by inscribing polygons in, and circumscribing polygons about, the curves.

Just as (G. § 8) a segment of a line is given a sense, so a sense may be given to an area. This is done as follows. If we go round the boundary of an area, the latter is either to the right or to the left. If we turn round and go in the opposite sense, then the area will be to the left if it was first to the right, and *vice versa*. If we give the boundary a definite sense, and go round in this sense, then the area is said to be *either of the one or of the other sense according as the area is to the right or to the left*. The area is generally said to be positive if it is to the left. The sense of the boundary is

indicated either by an arrowhead or by the order of the letters which denote points in the boundary. Thus, if A , B , C be the vertices of a triangle, then ABC shall denote the area in magnitude and sense, the sense being fixed by going round the triangle in the order from A to B to C . It will then be seen that ABC and ACB denote the same area but with opposite sense, and generally $ABC = BCA = CAB = -ACB = -BAC = -CBA$; that is, an interchange of two letters changes the sense. Also, if A and A' are two points on opposite sides of, and equidistant from, the line BC , then $ABC = -A'BC$.

Taking account of the sense, we may make the following statement:

If A, A' are two corresponding points, if the line AA' cuts the axis in B , and if C is any other point in the axis, then the triangles ABC and $A'BC$ are corresponding, and

$$\frac{ABC}{A'BC} = \frac{AB}{A'B} = \frac{AB}{BA'};$$

or The constant ratio of corresponding areas is equal and opposite to the ratio in which the axis divides the segment joining two corresponding points.

§ 18. Several special cases of parallel projection are of interest.

ORTHOGRAPHIC PROJECTION.—If the two planes π and π' have a definite position in space, and if a figure in π is projected to π' by rays perpendicular to this plane, then the projection is said to be *orthographic*. If in this case the plane π be turned till it coincides with π' so that the figures remain perspective, then the projecting rays will be perpendicular to the axis of projection, because any one of these rays is, and remains during the turning, perpendicular to the axis.

The constant ratio of the area of the projection to that of the original figure is, in this case, the cosine of the angle between the two planes π and π' , as will be seen by projecting a rectangle which has its base in the axis.

Orthographic projection is of constant use in geometrical drawing, and will be treated of fully later on in this article (§ 28 sq.).

SHEAR.—If the centre of projection be taken at infinity on the axis, then the projecting rays are parallel to the axis; hence corresponding points will be equidistant from the axis. In this case therefore areas of corresponding figures will be equal.

If A, A' and B, B' (Fig. 7) are two pairs of corresponding points on the same line, parallel to the axis, then, as corresponding segments parallel to the axis are equal, it follows that $AB = A'B'$, hence also $AA' = BB'$. If these points be joined to any point O on the axis, then AO and $A'O$ will be corresponding lines; they will therefore

FIG. 7.

be cut by any line parallel to the axis in corresponding points. In the figure therefore C, C' and also D, D' will be pairs of corresponding points and $CC' = DD'$. As the ratio CC'/AA' equals the ratio of the distances of C and A from the axis, therefore—

Two corresponding figures may be got one out of the other by moving all points in the one parallel to a fixed line, the axis, through distances which are proportional to their own distances from the axis. Points in a line remain hereby in a line.

Such a transformation of a plane figure is produced by a shearing stress in any section of a homogeneous elastic solid. For this reason Sir William Thomson has given it the name of shear.

A shear of a plane figure is determined if we are given the axis and the distance through which one point has been moved; for in this case the axis, the centre, and a pair of corresponding points are given.

§ 19. SYMMETRY AND SKEW-SYMMETRY.—If the centre is not on the axis, and if corresponding points are at equal distances from it, they must be on opposite sides of it. The figures will be in involution (§ 11). In this case the direction of the projecting rays is said to be *conjugate* to the axis.

The conjugate direction may be perpendicular to the axis. If the line joining two corresponding points A, A' cuts the axis in B , then $AB = BA'$. Therefore, if the plane be folded over along the axis, A will fall on A' . Hence by this folding over every point will coincide with its corresponding point. The figures therefore are identically equal or congruent, and in their original position they are *symmetrical* with regard to the axis, which itself is called an *axis of symmetry*. If the two figures are considered as one this one is said to be *symmetrical* with regard to an axis, and is said to have an axis of symmetry or simply an axis. Every diameter of a circle is thus an axis; also the median line of

an isosceles triangle and the diagonals of a rhombus are axes of the figures to which they belong.

In the more general case where the projecting rays are not perpendicular to the axis we have a kind of twisted symmetry which may be called *skew-symmetry*. It can be got from symmetry by giving the whole figure a shear. It will also be easily seen that we get skew-symmetry if we first form a shear to a given figure and then separate it from its shear by folding it over along the axis of the shear, which thereby becomes an axis of skew-symmetry.

Skew-symmetrical and therefore also symmetrical figures have the following properties:

Corresponding areas are equal, but of opposite sense.

Any two corresponding lines are harmonic conjugates with regard to the axis and a line in the conjugate direction.

If the two figures be again considered as one whole, this is said to be skew-symmetrical and to have an axis of skew-symmetry. Thus the median line of any triangle is an axis of skew-symmetry, the side on which it stands having the conjugate direction, the other sides being conjugate lines. From this it follows, for instance, that the three median lines of a triangle meet in a point. For two median lines will be corresponding lines with regard to the third as axis, and must therefore meet on the axis.

An axis of skew-symmetry is generally called a *diameter*. Thus every diameter of a conic is an axis of skew-symmetry, the conjugate direction being the direction of the chords which it bisects.

§ 20. We state a few properties of these figures useful in mechanics, but we omit the easy proofs:

If a plane area has an axis of skew-symmetry, then the mass-centre (centre of mean distances or centre of inertia) lies on it.

If a figure undergoes a shear, the mass-centre of its area remains the mass-centre; and generally—

In parallel projection the mass-centres of corresponding areas (or of groups of points, but not of curves) are corresponding points.

The moment of inertia of a plane figure does not change if the figure undergoes a shear in the direction of the axis with regard to which the moment has been taken.

If a figure has an axis of skew-symmetry, then this axis and the conjugate direction are conjugate diameters of the momental ellipse for every point in the axis.

If a figure has an axis of symmetry, then this is an axis of the momental ellipse for every point in it.

The truth of the last propositions follows at once from the fact that the product of inertia for the lines in question vanishes.

It is of interest to notice how a great many propositions of Euclid are only special cases of projection. The theorems Eucl. I. 35–41 about parallelograms or triangles on equal bases and between the same parallels are examples of shear, whilst I. 43 gives a case of skew-symmetry, hence of involution. Figures which are identically equal are of course projective, and they are perspective when placed so that they have an axis or a centre of symmetry (comp. Henri, *Elementary Geometry, Congruent Figures*). In this case again the relation is that of involution. The importance of treating similar figures when in perspective position has long been recognized; we need only mention the well-known proposition about the centres of similitude of circles.

APPLICATIONS TO CONICS.

§ 21. THEOREM.—*Any conic can be projected into any other conic. This may be done in such a manner that three points on one conic and the tangents at two of them are projected to three arbitrarily selected points and the tangents at two of them on the other.*

Proof.—If u and u' are any two conics, then we have to prove that we can project u in such a manner that five points on it will be projected to points on u' . As the projection is determined as soon as the projections of any four points or four lines are selected, we cannot project any five points of u to any five arbitrarily selected points on u' . But if A, B, C be any three points on u , and if the tangents at B and C meet at D , if further A', B', C' are any three points on u' , and if the tangents at B' and C' meet at D' , then the plane of u may be projected to the plane of u' in such a manner that the points A, B, C, D are projected to A', B', C', D' . This determines the correspondence (§ 14). The conic u will be projected into a conic, the points A, B, C and the tangents BD and CD to the points A', B', C' and the lines $B'D$ and $C'D$, which are tangents to u' at B' and C' . The projection of u must therefore (G. § 52) coincide with u' , because it is a conic which has three points and the tangents at two of them in common with u' .

Similarly we might have taken *three tangents and the points*

of contact of two of them as corresponding to similar elements on the other.

If the one conic be a circle which cuts the line j , the projection will cut the line at infinity in two points; hence it will be an hyperbola. Similarly, if the circle touches j , the projection will be a parabola; and, if the circle has no point in common with j , the projection will be an ellipse. These curves appear thus as sections of a circular cone, for in case that the two planes of projection are separated the rays projecting the circle form such a cone.

Any conic may be projected into itself.

If we take any point S in the plane of a conic as centre, the polar of this point as axis of projection, and any two points in which a line through S cuts the conic as corresponding points, then these will be harmonic conjugates with regard to the centre and the axis. We therefore have involution (§ 11), and every point is projected into its harmonic conjugate with regard to the centre and the axis,—hence every point A on the conic into that point A' on the conic in which the line SA' cuts the conic again, as follows from the harmonic properties of pole and polar (G. § 62 sq.).

Two conics which cut the line at infinity in the same two points are similar figures and similarly situated,—the centre of similitude being in general some finite point.

To prove this we take the line at infinity and the asymptotes of one as corresponding to the line at infinity and the asymptotes of the other, and besides a tangent to the first as corresponding to a parallel tangent to the other. The line at infinity will then correspond to itself point for point; hence the figures will be similar and similarly situated.

§ 22. AREAS OF PARABOLIC SEGMENTS.—One parabola may always be considered as a parallel projection of another in such a manner that any two points A, B on the one correspond to any two points A', B' on the other; that is, the points A, B and the point at infinity on the one may be made to correspond respectively to the points A', B' and the point at infinity on the other, whilst the tangents at A and at infinity of the one correspond to the tangent at B' and at infinity of the other. This completely determines the correspondence, and it is parallel projection because the line at infinity corresponds to the line at infinity. Let the tangents at A and B meet at C , and those at A', B' at C' ; then C, C' will correspond, and so will the triangles ABC and $A'B'C'$ as well as the parabolic segments cut off by the chords AB and $A'B'$. If (AB) denotes the area of the segment cut off by the chord AB we have therefore

$$(AB)/ABC = (A'B')/A'B'C'; \text{ or}$$

The area of a segment of a parabola stands in a constant ratio to the area of the triangle formed by the chord of the segment and the tangents at the end points of the chord.

If then (Fig. 8) we join the point C to the mid-point M of AB , then this line l will be bisected at D by the parabola (G. § 74), and the tangent at D will be parallel to AB . Let this tangent cut AC in E and CB in F , then by the last theorem

FIG. 8.

$$\frac{(AB)}{ABC} = \frac{(AD)}{ADE} = \frac{(BD)}{BFD} = m,$$

where m is some number to be determined. The figure gives

$$(AB) = ABD + (AD) + (BD).$$

Combining both equations, we have

$$ABD = m(ABC - ADE - BFD).$$

But we have also $ABD = \frac{1}{2} ABC$, and $ADE = BFD = \frac{1}{2} ABC$; hence

$$\frac{1}{2} ABC = m(1 - \frac{1}{2} - \frac{1}{2}) ABC, \text{ or } m = \frac{2}{3}.$$

The area of a parabolic segment equals two-thirds of the area of the triangle formed by the chord and the tangents at the end points of the chord.

§ 23. ELLIPTIC AREAS.—To consider one ellipse a parallel projection of another we may establish the correspondence as follows. If AC, BD are any pair of conjugate diameters of the one and $A'C', B'D'$ any pair of conjugate diameters of the other, then these may be made to correspond to each other, and the correspondence will be completely determined if the parallelogram formed by the tangents at A, B, C, D is made to correspond to that formed by the tangents A', B', C', D' (§§ 17 and 21). As the projection of the first conic has the four points A', B', C', D' and the tangents at

these points in common with the second, the two ellipses are projected one into the other. Their areas will correspond, and so do those of the parallelograms ABCD and A'B'C'D'. Hence

The area of an ellipse has a constant ratio to the area of any inscribed parallelogram whose diagonals are conjugate diameters, and also to every circumscribed parallelogram whose sides are parallel to conjugate diameters.

It follows at once that

All parallelograms inscribed in an ellipse whose diagonals are conjugate diameters are equal in area; and

All parallelograms circumscribed about an ellipse whose sides are parallel to conjugate diameters are equal in area.

If a, b are the length of the semi-axis of the ellipse, then the area of the circumscribed parallelogram will be $4ab$ and of the inscribed one $2ab$.

For the circle of radius r the inscribed parallelogram becomes the square of area $2r^2$ and the circle has the area πr^2 ; the constant ratio of an ellipse to the inscribed parallelogram has therefore also the value $\frac{\pi}{2}$. Hence

The area of an ellipse equals πab .

§ 24. PROJECTIVE PROPERTIES.—The properties of the projection of a figure depend partly on the relative position of the planes of the figure and the centre of projection, but principally on the properties of the given figure. Points in a line are projected into points in a line, harmonic points into harmonic points, a conic into a conic; but parallel lines are not projected into parallel lines nor right angles into right angles, neither are the projections of equal segments or angles again equal. There are then some properties which remain unaltered by projection, whilst others change. The former are called projective or descriptive, the latter metrical properties of figures, because the latter all depend on measurement.

To a triangle and its median lines correspond a triangle and three lines which meet in a point, but which as a rule are not median lines.

In this case, if we take the triangle together with the line at infinity, we get as the projection a triangle ABC, and some other line j which cuts the sides a, b, c of the triangle in the points A_1, B_1, C_1 . If we now take on BC the harmonic conjugate A_2 to A_1 and similarly on CA and AB the harmonic conjugates to B_1 and C_1 respectively, then the lines AA_2, BB_2, CC_2 will be the projections of the median lines in the given figure. Hence these lines must meet in a point.

As the triangle and the fourth line we may take any four given lines, because any four lines may be projected into any four given lines (§ 14). This gives a theorem:

If each vertex of a triangle be joined to that point in the opposite side which is, with regard to the vertices, the harmonic conjugate of the point in which the side is cut by a given line, then the three lines thus obtained meet in a point.

We get thus out of the special theorem about the median lines of a triangle a more general one. But before this could be done we had to add the line at infinity to the lines in the given figure.

In a similar manner a great many theorems relating to metrical properties can be generalized by taking the line at infinity or points at infinity as forming part of the original figure. Conversely special cases relating to measurement are obtained by projecting some line in a figure of known properties to infinity. This is true for all properties relating to parallel lines or to bisection of segments, but not immediately for angles. It is, however, possible to establish for every metrical relation the corresponding projective property. To do this it is necessary to consider imaginary elements. These have originally been introduced into geometry by aid of coördinate geometry, where imaginary quantities constantly occur as roots of equations.

Their introduction into pure geometry is due principally to Poncelet, who by the publication of his great work *Traité des Propriétés Projectives des Figures* became the founder of projective geometry in its widest sense. Monge had considered parallel projection and had already distinguished between permanent and accidental properties of figures, the latter being those which depended merely on the accidental position of one part to another. Thus in projecting two circles which lie in different planes it depends on the accidental position of the centre of projection whether the projections be two conics which do or do not meet. Poncelet introduced the principle of continuity in order to make theorems general and independent of those accidental positions which depend analytically on the fact that the equations used have real or imaginary roots. But the correctness of this principle remained without a proof. Von Straudt has, however, shown how it is possible to introduce imaginary elements by purely geometrical reasoning, and we shall now try to give the reader some idea of his theory.

§ 25. IMAGINARY ELEMENTS.—If a line cuts a curve and

if the line be moved, turned for instance about a point in it, it may happen that two of the points of intersection approach each other till they coincide. The line then becomes a tangent. If the line is still further moved in the same manner it separates from the curve and two points of intersection are lost. Thus in considering the relation of a line to a conic we have to distinguish three cases—the line cuts the conic in two points, touches it, or has no point in common with it. This is quite analogous to the fact that a quadratic equation with one unknown quantity has either two, one, or no roots. But in algebra it has long been found convenient to express this differently by saying a quadratic equation has always two roots, but these may be either both real and different, or equal, or they may be imaginary. In geometry a similar mode of expressing the fact above stated is not less convenient.

We say therefore a line has always two points in common with a conic, but these are either distinct, or coincident, or invisible. The word imaginary is generally used instead of invisible; but, as the points have nothing to do with imagination, we prefer the word "invisible" recommended originally by Clifford.

Invisible points occur in pairs of conjugate points, for a line loses always two visible points of intersection with a curve simultaneously. This is analogous to the fact that an algebraical equation with real coefficients has imaginary roots in pairs. *Only one real line can be drawn through an invisible point, for two real lines meet in a real or visible point. The real line through an invisible point contains also its conjugate.*

Similarly there are invisible lines—tangents, for instance, from a point within a conic—which occur in pairs of conjugates, two conjugates having a real point in common.

The introduction of invisible points would be nothing but a play upon words unless there is a real geometrical property indicated which can be used in geometrical constructions—that it has a definite meaning, for instance, to say that two conics cut a line in the same two invisible points, or that we can draw one conic through three real points and the two invisible ones which another conic has in common with a line that does not actually cut it. We have in fact to give a geometrical definition of invisible points. This is done by aid of the theory of involution (G. § 76 sq.).

An involution of points on a line has (according to G. § 77 (2)) either two or one or no foci. Instead of this we now say it has always two foci, which may be distinct, coincident, or invisible. These foci are determined by the involution, but they also determine the involution. If the foci are real this follows from the fact that conjugate points are harmonic conjugates with regard to the foci. That it is also the case for invisible foci will presently appear. If we take this at present for granted we may replace a pair of real, coincident, or invisible points by the involution of which they are the foci.

Now any two pairs of conjugate points determine an involution (G. § 77 (6)).

Hence any point-pair, whether real or invisible, is completely determined by any two pairs of conjugate points of the involution which has the given point-pair as foci and may therefore be replaced by them.

Two pairs of invisible points are thus said to be identical if, and only if, they are the foci of the same involution.

We know (G. § 82) that a conic determines on every line an involution in which conjugate points are conjugate poles with regard to the conic—that is, that either lies on the polar of the other. This holds whether the line cuts the conic or not. Furthermore, in the former case the points common to the line and the conic are the foci of the involution. Hence we now say that this is always the case, and that the invisible points common to a line and a conic are the invisible foci of the involution in question. If then we state the problem of drawing a conic which passes through two points given as the intersection of a conic and a line as that of drawing a conic which determines a given involution on the line, we have it in a form in which it is independent of the accidental circumstance of the intersections being real or invisible. So is the solution of the problem, as we shall now show.

§ 26. We have seen (§ 21) that a conic may always be projected into itself by taking any point S as centre and its polar s as axis of projection, corresponding points being those in which a line through S cuts the conic. If then (Fig. 9) A, A' and B, B' are pairs of corresponding points so that the lines AA' and BB' pass through S , then the lines AB and $A'B'$, as corresponding lines, will meet at a point R on the axis, and the lines AB' and $A'B$ will meet at another point R' on the axis. These points R, R' are conjugate points in the involution which the conic determines on the line s because the triangle RSR' is a polar triangle (G. § 62), so that R' lies on the polar of R .

This gives a simple means of determining for any point Q on the line s its conjugate point Q' . We take any two points A, A' on the conic which lie on a line through S , join

FIG. 9.

Q to A by a line cutting the conic again in C , and join C to A' . This line will cut s in the point Q' required.

PROBLEM.—To draw some conic which shall determine on a line s a given involution.

Solution.—We have here to reconstruct the Fig. 9, having given on the line s an involution. Let Q, Q' and R, R' (Fig. 9) be two pairs of conjugate points in this involution. We take any point B and join it to R and R' , and another point C to Q and Q' . Let BR and CQ meet at A , and BR' and CQ' at A' . If now a point P be moved along s its conjugate point P' will also move and the two points will describe projective rows. The two rays AP and $A'P'$ will therefore describe projective pencils, and the intersection of corresponding rays will lie on a conic which passes through A, A', B , and C . This conic determines on s the given involution.

Of these four points not only B and C but also the point A may be taken arbitrarily, for if A, B, C are given, the line AB will cut s in some point R . As the involution is supposed known, we can find the point R' conjugate to R , which we join to B . In the same way the line CA will cut s in some point Q . Its conjugate point Q' we join to C . The line CQ' will cut BR' in a point A' , and then AA' will pass through the pole S (comp. Fig. 9). We may now interchange A and B and find the point B' . Then BB' will also pass through S , which is thus found. At the same time five points A, B, C, A', B' on the conic have been found, so that the conic is completely known, which determines on the line s the given involution. Hence—

THEOREM.—Through three points we can always draw one conic, and only one, which determines on a given line a given involution, all the same whether the involution has real, coincident, or invisible foci.

In the last case the theorem may now also be stated thus:

THEOREM.—It is always possible to draw a conic which passes through three given real points and through two invisible points which any other conic has in common with a line.

§ 27. The above theory of invisible points gives rise to a great number of interesting consequences, of which we state a few.

The theorem at the end of § 21 may now be stated:

THEOREM.—Any two conics are similar and similarly situated if they cut the line at infinity in the same two points—real, coincident, or invisible.

It follows that

Any two parabolas are similar; and they are similarly situated as soon as their axes are parallel.

The involution which a circle determines at its centre is circular (G. § 79); that is, every line is perpendicular to its conjugate line. This will be cut by the line at infinity in an involution which has the following property: The lines which join any finite point to two conjugate points in the involution are at right angles to each other. Hence all circular involutions in a plane determine the same involution on the line at infinity. The latter is therefore called the *circular involution on the line at infinity*; and the involution which a circle determines at its centre is called the *circular involution at that point*. All circles determine thus on the line at infinity the same involution; in other words, they have the same two invisible points in common with the line at infinity.

THEOREM.—All circles may be considered as passing through the same two points at infinity.

These points are called the *circular points at infinity*, and by Prof. Cayley the *absolute* in the plane. They are the foci of the circular involution in the line at infinity.

Conversely—Every conic which passes through the circular points is a circle; because the involution at its centre is circular, hence conjugate diameters are at right angles, and this property only circles possess.

We now see why we can draw always one and only one

circle through any three points; these three points together with the circular points at infinity are five points through which one conic only can be drawn.

Any two circles are similar and similarly situated because they have the same points at infinity (§ 21).

Any two concentric circles may be considered as having double contact at infinity, because the lines joining the common centre to the circular points at infinity are tangents to both circles at the circular points, as the line at infinity is the polar of the centre.

Any two lines at right angles to one another are harmonic conjugates with regard to the rays joining their intersection to the circular points, because these rays are the focal rays of the circular involution at the intersection of the given lines.

To bisect an angle with the vertex A means (G. § 23) to find two rays through A which are harmonic conjugates with regard to the limits of the angle and perpendicular to each other. These rays are therefore harmonic with regard to the limits of the given angle and with regard to the rays through the circular points. Thus perpendicularity and bisection of an angle have been stated in a projective form.

It must not be forgotten that the circular points do not exist at all; but to introduce them gives us a short way of making a statement which would otherwise be long and cumbersome.

We can now generalize any theorem relating to metrical properties. For instance, the simple fact that the chord of a circle is touched by a concentric circle at its mid point proves the theorem:

If two conics have double contact, then the points where any tangent to one of them cuts the other are harmonic with regard to the point of contact and the point where the tangent cuts the chord of contact.

DESCRIPTIVE GEOMETRY.

For many, especially technical, purposes it is of the utmost importance to represent solids and other figures in three dimensions by a drawing in one plane.

A variety of methods have been introduced for this purpose. The most important is that which towards the end of the last century was invented by Monge under the name of “descriptive geometry.” We give the elements of his method. It is based on parallel projections to a plane by rays perpendicular to the plane. Such a projection is called *orthographic* (§ 18). If the plane is horizontal the projection is called the *plan* of the figure, and if the plane is vertical the *elevation*. In Monge’s method a figure is represented by its plan and elevation. It is therefore often called *drawing in plan and elevation*, and sometimes simply *orthographic projection*.

§ 28. We suppose then that we have two planes, one horizontal, the other vertical, and these we call the planes of plan and of elevation respectively, or the horizontal and the vertical plane, and denote them by the letters π_1 and π_2 . Their line of intersection is called the *axis*, and shall be denoted by the letter x .

If the surface of the drawing paper is taken as the plane of the plan, then the vertical plane will be the plane perpendicular to it through the axis x . To bring this also into the plane of the drawing paper we turn it about the axis till it coincides with the horizontal plane. This process of turning one plane down till it coincides with another is called *rabatting* one to the other. Of course there is no necessity to have one of the two planes horizontal, but even when this is not the case it is convenient to retain the above names.

The whole arrangement will be better understood by a glance at Fig. 10. A point A in space is there projected by the perpendicular AA_1 and AA_2 to the planes π_1 and π_2 , so that A_1 and A_2 are the horizontal and vertical projections of A .

If we remember that a line is perpendicular to a plane that is perpendicular to every line in the plane if only it is perpendicular to any two intersecting lines in the plane,¹ we see that the axis which is perpendicular both to AA_1 and to AA_2 is also perpendicular to A_1A_2 and to A_2A_1 because these four lines are all in the same plane. Hence, if the

¹ It is very convenient here to make use of the modern extension of the meaning of an angle according to which we take as the angle between two non-intersecting lines the angle between two intersecting lines parallel respectively to the given ones. If this angle is a right angle, the lines are called perpendiculars. Euclid’s definition (XI. def. 3), and theorem (XI. 4) may then be stated as in the text. Compare also articles GEOMETRY (EUCLIDIAN), § 75, vol. x. p. 544.

plane π_2 be turned about the axis till it coincides with the

FIG. 10.

FIG. 11.

plane π_1 , then A_2A_0 will be the continuation of A_1A_0 . This position of the planes is represented in Fig. 11, in which the line A_1A_2 is perpendicular to the axis x .

Conversely any two points A_1, A_2 in a line perpendicular to the axis will be the projections of some point in space when the plane π_2 is turned about the axis till it is perpendicular to the plane π_1 , because in this position the two perpendiculars to the planes π_1 and π_2 through the points A_1 and A_2 will be in a plane and therefore meet at some point A .

REPRESENTATION OF POINTS.—We have thus the following method of representing in a single plane the position of points in space: we take in the plane a line x as the axis, and then any pair of points A_1, A_2 in the plane on a line perpendicular to the axis represent a point A in space. If the line A_1A_2 cuts the axis at A_0 , and if at A_1 a perpendicular be erected to the plane, then the point A will be in it at a height $A_1A = A_0A_2$ above the plane. This gives the position of the point A relative to the plane π_1 . In the same way, if in a perpendicular to π_2 through A_2 a point A be taken such that $A_2A = A_0A_1$, then this will give the point A relative to the plane π_2 .

§ 29. The two planes π_1, π_2 in their original position divide space into four parts. These are called the four quadrants. We suppose that the plane π_2 is turned as indicated in Fig. 10, so that the point P comes to Q and R to S , then the quadrant in which the point A lies is called the first, and we say that in the first quadrant a point lies above the horizontal and in front of the vertical plane. Now we go round the axis in the sense in which the plane π_2 is turned and come in succession to the second, third, and fourth quadrant. In the second a point lies above the plane of the plan and behind the plane of elevation, and so on. In Fig 12, which represents a side view of the planes in Fig. 10 the quadrants are marked, and in each a point with its projection is taken. Fig. 11 shows how these are represented when the plane π_2 is turned down. We see that

A point lies in the first quadrant if the plan lies below, the elevation above the axis; in the second if plan and elevation both lie above; in the third if the plan lies above, the elevation below; in the fourth if plan and elevation both lie below the axis.

If a point lies in the horizontal plane, its elevation lies in the axis and the plan coincides with the point itself. If a point lies in the vertical plane, its plan lies in the axis and the elevation coincides with the point itself. If a point lies in the axis, both its plan and elevation lie in the axis and coincide with it.

Of each of these propositions, which will easily be seen to be true, the converse holds also.

§ 30. **REPRESENTATION OF A PLANE.**—As we are thus enabled to represent points in a plane, we can represent any finite figure by representing its separate points. It is, however, not possible to represent a plane in this way, for the projections of its points completely cover the planes π_1 and π_2 , and no plane would appear different from any other. But any plane a cuts each of the planes π_1, π_2 in a line. These are called the traces of the plane. They cut each other in the axis at the point where the latter cuts the plane a .

A plane is determined by its two traces, which are two lines that

meet on the axis, and, conversely, any two lines which meet on the axis determine a plane.

If the plane is parallel to the axis its traces are parallel to the axis. Of these one may be at infinity; then the plane will cut one of the planes of projection at infinity and will be parallel to it. Thus a plane parallel to the horizontal plane of the plan has only one finite trace, viz., that with the plane of elevation.

If the plane passes through the axis both its traces coincide with the axis. This is the only case in which the representation of the plane by its two traces fails. A third plane of projection is therefore introduced, which is best taken perpendicular to the other two. We call it simply the third plane, and denote it by π_3 . As it is perpendicular to π_1 , it may be taken as the plane of elevation, its line of intersection y with π_1 being the axis, and be turned down to coincide with π_1 . This is represented in Fig. 13. OC is the axis x

FIG. 13.

whilst OA and OB are the traces of the third plane. They lie in one line y . The plane is rabatted about y to the horizontal plane. A plane a through the axis x will then show in it a trace a_3 . In Fig. 13 the lines OC and OP will thus be the traces of a plane through the axis x which makes an angle POQ with the horizontal plane.

We can also find the trace which any other plane makes with π_3 . In rabatting the plane π_3 its trace OB with the plane π_2 will come to the position OD . Hence a plane β having the traces CA and CB will have with the third plane the trace β_3 , or AD if $OD = OB$.

It also follows immediately that—

If a plane a is perpendicular to the horizontal plane, then every point in it has its horizontal projection in the horizontal trace of the plane, as all the rays projecting these points lie in the plane itself.

Any plane which is perpendicular to the horizontal plane has its vertical trace perpendicular to the axis.

Any plane which is perpendicular to the vertical plane has its horizontal trace perpendicular to the axis and the vertical projections of all points in the plane lie in this trace.

§ 31. **REPRESENTATION OF A LINE.**—A line is determined either by two points in it or by two planes through it. We get accordingly two representations of it either by projections or by traces.

First.—A line a is represented by its projections a_1 and a_2 on the two planes π_1 and π_2 . These may be any two lines, for, bringing the planes π_1, π_2 into their original position, the planes through these lines perpendicular to π_1 and π_2 respectively will intersect in some line a which has a_1, a_2 as its projections.

Secondly.—A line a is represented by its traces—that is, by the points in which it cuts the two planes π_1, π_2 . Any two points may be taken as the traces of a line in space, for it is determined when the planes are in their original position as the line joining the two traces. This representation becomes undetermined if the two traces coincide in the axis. In this case we again use a third plane, or else the projections of the line.

§ 32. The fact that there are different methods of representing points and planes, and hence two methods of representing lines, suggests the principle of duality (G. § 41). It is worth while to keep this in mind. It is also worth remembering that traces of planes or lines always lie in the planes or lines which they represent. Projections do not as a rule do this excepting when the point or line projected lies in one of the planes of projection.

§ 33. Having now shown how to represent points, planes, and lines, we have to state the conditions which must hold in order that these elements may lie one in the other, or else that the figure formed by them may possess certain

metrical properties. It will be found that the former are very much simpler than the latter.

Before we do this, however, we shall explain the notation used; for it is of great importance to have a systematic notation. We shall denote points in space by capitals A, B, C; planes in space by Greek letters α , β , γ ; lines in space by small letters a , b , c ; horizontal projections by suffixes 1, like A_1 , a_1 ; vertical projections by suffixes 2, like A_2 , a_2 ; traces by single and double dashes a' , a'' , a' , a'' . Hence P_1 will be the horizontal projection of a point P in space; a line a will have the projections a_1 , a_2 , and the traces a' and a'' ; a plane α has the traces α' and α'' .

§ 34. If a point lies in a line, the projections of the point lie in the projections of the line.

If a line lies in a plane, the traces of the line lie in the traces of the plane.

These propositions follow at once from the definitions of the projections and of the traces.

If a point lies in two lines its projections must lie in the projections of both. Hence

If two lines, given by their projections, intersect, the intersection of their planes and the intersection of their elevations must lie in a line perpendicular to the axis, because they must be the projections of the point common to the two lines.

Similarly—If two lines given by their traces lie in the same plane or intersect, then the lines joining their horizontal and vertical traces respectively must meet on the axis, because they must be the traces of the plane through them.

§ 35. To find the projections of a line which joins two points A, B, given by their projections, A_1 , A_2 , and B_1 , B_2 we join A_1 , B_1 and A_2 , B_2 ; these will be the projections required. For example, the traces of a line are two points in the line whose projections are known or at all events easily found. They are the traces themselves and the feet of the perpendiculars from them to the axis.

Hence if a' , a'' (Fig. 14) are the traces of a line a , and if the perpendiculars from them cut the axis in P and Q respectively, then the line $a'Q$ will be the horizontal and $a''P$ the vertical projection of the line.

Conversely, if the projections a_1 , a_2 of a line are given, and if these cut the axis in Q and P respectively, then the perpendiculars Pa' and Qa'' to the axis drawn through these points cut the projections a_1 and a_2 in the traces a' and a'' .

FIG. 14.

To find the line of intersection of two planes, we observe that this line lies in both planes; its traces must therefore lie in the traces of both. Hence the points where the horizontal traces of the given planes meet will be the horizontal, and the point where the vertical traces meet the vertical trace of the line required.

§ 36. To decide whether a point A, given by its projections, lies in a plane α , given by its traces, we draw a line p by joining A to some point in the plane α and determine its traces. If these lie in the traces of the plane, then the line, and therefore the point A, lies in the plane; otherwise not. This is conveniently done by joining A_1 to some point p_1 in the trace α_1 ; this gives p_1 ; and the point where the perpendicular from p_1 to the axis cuts the latter we join to A_2 ; this gives p_2 . If the vertical trace of this line lies in the vertical trace of the plane, then, and then only, does the line p , and with it the point A, lie in the plane α .

§ 37. Parallel planes have parallel traces, because parallel planes are cut by any plane, hence also by π_1 and by π_2 , in parallel lines.

Parallel lines have parallel projections, because points at infinity are projected to infinity.

If a line is parallel to a plane, then lines through the traces of the line and parallel to the traces of the plane must meet on the axis, because these lines are the traces of a plane parallel to the given plane.

§ 38. To draw a plane through two intersecting lines or through two parallel lines, we determine the traces of the lines; the lines joining their horizontal and vertical traces respectively will be the horizontal and vertical traces of the plane. They will meet, at a finite point or at infinity, on the axis if the lines do intersect.

To draw a plane through a line and a point without the line, we join the given point to any point in the line and determine the plane through this and the given line.

To draw a plane through three points which are not in a line,

we draw two of the lines which each join two of the given points and draw the plane through them. If the traces of all three lines AB, BC, CA be found, these must lie in two lines which meet on the axis.

§ 39. We have in the last example got more points, or can easily get more points, than are necessary for the determination of the figure required—in this case the traces of the plane. This will happen in a great many constructions and is of considerable importance. It may happen that some of the points or lines obtained are not convenient in the actual construction. The horizontal traces of the lines AB and AC may, for instance, fall very near together, in which case the line joining them is not well defined. Or, one or both of them may fall beyond the drawing paper, so that they are practically non-existent for the construction. In this case the traces of the line BC may be used. Or, if the vertical traces of AB and AC are both in convenient position, so that the vertical trace of the required plane is found and one of the horizontal traces is got, then we may join the latter to the point where the vertical trace cuts the axis.

Furthermore the draughtsman will never forget that the lines which he draws are not mathematical lines without thickness. For this reason alone every drawing is affected by some errors. And inaccuracies also come in in drawing the lines required in the construction. It is therefore very desirable to be able constantly to check the latter. Such checks always present themselves when the same result can be obtained by different constructions, or when, as in the above case, some lines must meet on the axis, or if three points must lie in a line. A careful draughtsman will always avail himself of these checks.

§ 40. To draw a plane through a given point parallel to a given plane α , we draw through the point two lines which are parallel to the plane α , and determine the plane through them; or, as we know that the traces of the required plane are parallel to those of the given one (§ 37), we need only draw one line l , through the point parallel to the plane and find one of its traces, say the vertical trace l'' ; a line through this parallel to the vertical trace of α will be the vertical trace β'' of the required plane β , and a line parallel to the horizontal trace of α meeting β'' on the axis will be the horizontal trace β' .

Let A_1 , A_2 (Fig. 15) be the given point, α' , α'' the given plane, a line l_1 through A_1 parallel to α' and a horizontal line l_2 through A_2 will be the projections of a line l through A parallel to the plane, because the horizontal plane through this line will cut the plane α in a line c which has its horizontal projection c_1 parallel to α' .

FIG. 15.

§ 41. We now come to the metrical properties of figures.

A line is perpendicular to a plane if the projections of the line are perpendicular to the traces of the plane. We prove it for the horizontal projection. If a line p is perpendicular to a plane α , every plane through p is perpendicular to α ; hence also the vertical plane which projects the line p to p_1 . As this plane is perpendicular both to the horizontal plane and to the plane α , it is also perpendicular to their intersection—that is, to the horizontal trace of α . It follows that every line in this projecting plane, therefore also p_1 , the plan of p , is perpendicular to the horizontal trace of α . Q.E.D.

To draw a plane through a given point A perpendicular to a given line p , we first draw through some point O in the axis lines y' , y'' perpendicular respectively to the projections p_1 and p_2 of the given line. These will be the traces of a plane γ which is perpendicular to the given line. We next draw through the given point A a plane parallel to the plane γ ; this will be the plane required.

Other metrical properties depend on the determination of the real size or shape of a figure.

In general the projection of a figure differs both in size and shape from the figure itself. But figures in a plane parallel to a plane of projection will be identical with their projections, and will thus be given in their true dimensions.

In other cases there is the problem, constantly recurring, either to find the true shape and size of a plane figure when plan and elevation are given, or, conversely, to find the latter from the known true shape of the figure itself. To do this, the plane is turned about one of its traces till it is laid down into that plane of projection to which the trace belongs. This is technically called *rabatting* the plane respectively into the plane of the plan or the elevation. As there is no difference in the treatment of the two cases, we shall consider only the case of rabatting a plane α into the plane of the plan. The plan of the figure is a parallel (orthographic) projection of the figure itself. The results of parallel projection (§§ 17 and 18) may therefore now be used. The trace a' will hereby take the place of what formerly was called the axis of projection. Hence we see that corresponding points in the plan and in the rabatted plane are joined by lines which are perpendicular to the trace a' and that corresponding lines meet on this trace. We also see that the correspondence is completely determined if we know for one point or one line in the plan the corresponding point or line in the rabatted plane.

Before, however, we treat of this we consider some special cases.

§ 42. To determine the distance between two points A, B given by their projections A_1, B_1 and A_2, B_2 .

FIG. 16.

Solution. The two points A, B in space lie vertically above their plans A_1, B_1 (Fig. 16) and $A_1A=A_2A_2, B_1B=B_2B_2$. The four points A, B, A_1, B_1 therefore form a plane quadrilateral on the base A_1B_1 and having right angles at the base. This plane we rabatt about A_1B_1 by drawing A_1A and B_1B perpendicular to A_1B_1 and making $A_1A=A_2A_2, B_1B=B_2B_2$. Then AB will give the length required.

The construction might have been performed in the elevation by making $A_2A=A_2A_1$ and $B_2B=B_2B_1$ on lines perpendicular to A_2B_2 . Of course AB must have the same length in both cases.

This figure may be turned into a model. We cut the paper along A_1A, AB , and BB_1 and fold the piece A_1ABB_1 over along A_1B_1 till it stands upright at right angles to the horizontal plane. The points A, B will then be in their true position in space relative to π_1 . Similarly if B_2BAA_2 be cut out and turned along A_2B_2 through a right angle we shall get AB in its true position relative to the plane π_2 . Lastly we fold the whole plane of the paper along the axis x till the plane π_2 is at right angles to π_1 . In this position the two sets of points AB will coincide if the drawing has been accurate.

FIG. 17.

Models of this kind can be made in many cases and their

construction cannot be too highly recommended in order to realize orthographic projection.¹

§ 43. To find the angle between two given lines a, b of which the projections a_1, b_1 and a_2, b_2 are given.

Solution.—Let a_1, b_1 (Fig. 17) meet in P_1, a_2, b_2 in T , then if the line P_1T is not perpendicular to the axis the two lines will not meet. In this case we draw a line parallel to b to meet the line a . This is easiest done by drawing first the line P_1P_2 perpendicular to the axis to meet a_2 in P_2 , and then drawing through P_2 a line c_2 parallel to b_2 ; then b_1, c_2 will be the projections of a line c , which is parallel to b and meets a in P . The plane α which these two lines determine we rabatt to the plan. We determine the traces a' and c' of the lines a and c ; then $a'c'$ is the trace a' of their plane. On rabatting the point P comes to a point S on the line P_1Q perpendicular to $a'c'$, so that $QS=QP$. But QP is the hypotenuse of a triangle PP_1Q with a right angle P_1 . This we construct by making $QR=P_2P_1$; then $P_1R=PQ$. The lines $a'S$ and $c'S$ will therefore include angles equal to those made by the given lines. It is to be remembered that two lines include two angles which are supplementary. Which of these is to be taken in any special case depends upon the circumstances.

To determine the angle between a line and a plane, we draw through any point in the line a perpendicular to the plane (§ 41) and determine the angle between it and the given line. The complement of this angle is the required one.

To determine the angle between two planes, we draw through any point two lines perpendicular to the two planes and determine the angle between the latter as above.

In special cases it is simpler to determine at once the angle between the two planes by taking a plane section perpendicular to the intersection of the two planes and rabatt this. This is especially the case if one of the planes is the horizontal or vertical plane of projection.

Thus in Fig. 18 the angle P_1QR is the angle which the plane α makes with the horizontal plane.

§ 44. We return to the general case of rabatting a plane α of which the traces $a' a''$ are given.

Here it will be convenient to determine first the position which the trace a'' —which is a line in α —assumes when rabatted. Points in this line coincide with their elevations. Hence it is given in its true dimension, and we can measure off along it the true distance between two points in it. If therefore (Fig. 18) P is any point in a'' originally coincident with its elevation P_2 , and if O is the point where a'' cuts the axis x , so that O is also in a' , then the point P will after rabatting the plane assume such a position that $OP=OP_2$.

FIG. 18.

At the same time the plan is an orthographic projection of the plane α . Hence the line joining P to the plan P_1 will after rabatting be perpendicular to a' . But P_1 is known; it is the foot of the perpendicular from P_2 to the axis x . We draw therefore, to find P , from P_1 a perpendicular P_1Q to a' and find on it a point P such that $OP=OP_2$. Then the line OP will be the position of a'' when rabatted. This line corresponds therefore to the plan of a'' —that is, to the axis x , corresponding points on these lines being those which lie on a perpendicular to a' .

We have thus one pair of corresponding lines and can now find for any point B_1 in the plan the corresponding point B in the rabatted plane. We draw a line through B_1 , say B_1P_1 , cutting a' in C . To it corresponds the line CP , and the point where this is cut by the projecting ray through B_1 , perpendicular to a' , is the required point B .

Similarly any figure in the rabatted plane can be found when the plan is known; but this is usually found in a dif-

¹ In order to make a sharp crease along A_1B_1 , it is well to place a straight edge along this line, and then to turn the piece A_1ABB_1 up against it.

ferent manner without any reference to the general theory of parallel projection. As this method and the reasoning employed for it have their peculiar advantages, we give it also.

Supposing the planes π_1 and π_2 to be in their positions in space perpendicular to each other, we take a section of the whole figure by a plane perpendicular to the trace a' about which we are going to rabatt the plane α . Let this section pass through the point Q in a' . Its traces will then be the lines QP₁ and P₁P₂ (Fig. 18). These will be at right angles, and will therefore, together with the section QP₂ of the plane α , form a right-angled triangle QP₁P₂ with the right angle at P₁, and having the sides P₁Q and P₁P₂ which both are given in their true lengths. This triangle we rabatt about its base P₁Q making P₁R = P₁P₂. The line QR will then give the true length of the line QP in space. If now the plane α be turned about a' the point P will describe a circle about Q as centre with radius QP = QR, in a plane perpendicular to the trace a' . Hence when the plane α has been rabatted into the horizontal plane the point P will lie in the perpendicular P₁Q to a' , so that QP = QR.

If A₁ is the plan of a point A in the plane α , and if A₁ lies in QP₁, then the point A will lie vertically above A₁ in the line QP. On turning down the triangle QP₁P₂, the point A will come to A₀, the line A₁A₀ being perpendicular to QP₁. Hence A will be a point in QP such that QA = QA₀.

If B₁ is the plan of another point, but such that A₁B₁ is parallel to a' , then the corresponding line AB will also be parallel to a' . Hence, if through A a line AB be drawn parallel to a' and B₁ B perpendicular to a' , then their intersection gives the point B. Thus of any point given in plan the real position in the plane α , when rabatted, can be found by this second method. This is the one most generally given in books on geometrical drawing. The first method explained is, however, in most cases preferable as it gives the draughtsman a greater variety of constructions. It requires a somewhat greater amount of theoretical knowledge.

If instead of our knowing the plan of a figure the latter is itself given; then the process of finding the plan is the reverse of the above and needs little explanation. We give an example.

§ 45. PROBLEM.—It is required to draw the plan and elevation of a polygon of which the real shape and position in a given plane α are known.

Solution.—We first rabatt the plane α (Fig. 19) as before so that P₁ comes to P, hence OP₁ to OP. Let the given polygon

FIG. 19.

in α be the figure ABCDE. We project, not the vertices, but the sides. To project the line AB, we produce it to cut a' in F and OP in G, and draw GG₁ perpendicular to a' ; then G₁ corresponds to G, therefore FG₁ to FG. In the

same manner we might project all the other sides, at least those which cut OF and OP in convenient points. It will be best, however, first to produce all the sides to cut OP and a' and then to draw all the projecting rays through A, B, C . . . perpendicular to a' , and in the same direction the lines G₁, G₂, etc. By drawing FG we get the points A₁, B₁ on the projecting ray through A and B. We then join B to the point M where BC produced meets the trace a' . This gives C₁. So we go on till we have found E₁. The line A₁E₁ must then meet AE in a' , and this gives a check. If one of the sides cuts a' or OP beyond the drawing paper this method fails, but then we may easily find the projection of some other line, say of a diagonal, or directly the projection of a point, by the former methods. The diagonals may also serve to check the drawing, for two corresponding diagonals must meet in the trace a' .

Having got the plan we easily find the elevation. The elevation of G is above G₁ in a'' , and that of F is at F₂ in the axis. This gives the elevation F₂G₂ of FG and in it we get A₂B₂ in the verticals through A₁ and B₁. As a check we have OG = OG₂. Similarly the elevation of the other sides and vertices are found.

§ 46. We have now obtained the ABC of descriptive geometry, and proceed to give some applications to the representation of solids and of the solution of problems connected with them.

PROBLEM.—Of a pyramid are given its base, the length of the perpendicular from the vertex to the base, and the point where this perpendicular cuts the base; it is required first to develop the whole surface of the pyramid into one plane, and second to determine its section by a plane which cuts the plane of the base in a given line and makes a given angle with it.

Solution.—(1) As the planes of projection are not given we can take them as we like, and we select them in such a manner that the solution becomes as simple as possible. We take the plane of the base as the horizontal plane and the vertical plane perpendicular to the plane of the section. Let then (Fig. 20) ABCD be the base of the pyramid, V₁ the plan of the vertex, then the elevations of A, B, C, D will be in the axis at A₂, B₂, C₂, D₂, and the vertex at some point V₂ above V₁ at a known distance from the axis. The lines V₁A, V₁B, etc., will be the plans and the lines V₂A₂, V₂B₂, etc., the elevations of the edges of the pyramid, of which thus plan and elevation are known.

We develop the surface into the plane of the base by turning each lateral face about its lower edge into the horizontal plane by the method used in § 43. If one face has been turned down, say ABV to AVP, then the point Q to which the vertex of the next face BCV comes can be got more simply by finding on the line V₁Q perpendicular to BC the point Q such that BQ = BP, for these lines represent the same edge BV of the pyramid. Next R is found by making CR = CQ, and so on till we have got the last vertex—in this case S. The fact that AS must equal AP gives a convenient check.

(2) The plane α whose section we have to determine has its horizontal trace given perpendicular to the axis, and its vertical trace makes the given angle with the axis. This determines it. To find the section of the pyramid by this plane there are two methods applicable: we find the sections of the plane either with the faces or with the edges of the pyramid. We use the latter.

As the plane α is perpendicular to the vertical plane, the trace a'' contains the projection of every figure in it; the points E₂, F₂, G₂, H₂ where this trace cuts the elevations of the edges will therefore be the elevations of the points where the edges cut α . From these we find the plans E₁, F₁, G₁, H₁, and by joining them the plan of the section. If from E₁, F₁, lines be drawn perpendicular to AB, these will determine the points E, F on the developed face in which the plane α cuts it; hence also the line EF. Similarly on the other faces. Of course BF must be the same length on BP and on BQ. If the plane α be rabatted to the plan, we get the real shape of the section as shown in the figure EFGH. This is done easily by making F₀F = OF₂, etc. If the figure representing the development of the pyramid, or better a copy of it, is cut out, and if the lateral faces be bent along the lines AB, BC, etc., we get a model of the pyramid with the section marked on its faces. This may be placed on its plan ABCD and the plane of elevation bent about the axis α . The pyramid stands then in front of its elevations. If next the plane α with a hole cut out representing the true section be bent along the trace a' till its edge coincides with a'' , the edges of the hole ought to coincide with the lines EF, FG, etc., on the faces.

§ 47. Polyhedra like the pyramid in § 46 are represented by the projections of their edges and vertices. But solids bounded by curved surfaces, or surfaces themselves, cannot be thus represented.

For a surface we may use, as in case of the plane, its tra-

ces—that is, the curves in which it cuts the planes of projection. We may also project points and curves on the surface. A ray cuts the surface generally in more than one point; hence it will happen that some of the rays touch the surface, if two of these points coincide. The points of contact of these rays will form some curve on the surface and this will appear from the centre of projection as the boundary of the surface or of part of the surface. The outlines of all surfaces of solids which we see about us are formed by the points at which rays through our eye touch the surface. The projections of these contours are therefore best adapted to give an idea of the shape of a surface.

FIG. 20.

Thus the tangents drawn from any finite centre to a sphere form a right circular cone, and this will be cut by any plane in a conic. It is often called the projection of a sphere, but it is better called the contour-line of the sphere, as it is the boundary of the projections of all points on the sphere.

If the centre is at infinity the tangent cone becomes a right circular cylinder touching the sphere along a great circle, and if the projection is, as in our case, orthographic, then the section of this cone by a plane of projection will be a circle equal to the great circle of the sphere. We get such a circle in the plan and another in the elevation, their centres being plan and elevation of the centre of the sphere.

Similarly the rays touching a cone of the second order will lie in two planes which pass through the vertex of the cone, the contour-line of the projection of the cone consists therefore of two lines meeting in the projection of the vertex. These may, however, be invisible if no real tangent rays can be drawn from the centre of projection; and this happens when the ray projecting the centre of the vertex lies within the cone. In this case the traces of the cone are of importance. Thus in representing a cone of revolution with a vertical axis we get in the plan a circular trace of the surface whose centre is the plan of the vertex of the cone, and in the elevation the contour, consisting of a pair of lines intersecting in the elevation of the vertex of the cone. The circle in the plan and the pair of lines in the elevation do not determine the surface, for an infinite number of surfaces might be conceived which pass through the circular trace and touch two planes through the contour lines in the vertical plane. The surface becomes only completely defined if we write down to the figure that it shall represent a cone. The same holds for all surfaces. Even a plane is fully represented by its traces only under the silent understanding that the traces are those of a plane.

§ 48. Some of the simpler problems connected with the representation of surfaces are the determination of plane sections and of the curves of intersection of two such surfaces. The former is constantly used in nearly all problems concerning surfaces. Its solution depends of course on the nature of the surface.

To determine the curve of intersection of two surfaces, we take a plane and determine its section with each of the two surfaces, rabutting this plane if necessary. This gives two curves which lie in the same plane and whose intersections will give us points on both surfaces. It must here be remembered that two curves in space do not necessarily intersect, hence that the points in which their projections intersect are not necessarily the projections of points common to the two curves. This will, however, be the case if the two curves lie in a common plane. By taking then a number of plane sections of the surfaces we can get as many points on their curve of intersection as we like. These planes have, of course, to be selected in such a way that the sections are curves as simple as the case permits of, and such that they can be easily and accurately drawn. Thus when possible the sections should be straight lines or circles. This not only saves time in drawing but determines all points on the sections, and therefore also the points where the two curves meet, with equal accuracy.

§ 49. We give a few examples how these sections have to be selected.

A cone is cut by every plane through the vertex in lines, and if it is a cone of revolution by planes perpendicular to the axis in circles.

A cylinder is cut by every plane parallel to the axis in lines, and if it is a cylinder of revolution by planes perpendicular to the axis in circles.

A sphere is cut by every plane in a circle.

Hence in case of two cones situated anywhere in space we take sections through both vertices. These will cut both cones in lines. Similarly in case of two cylinders we may take sections parallel to the axis of both. In case of a sphere and a cone of revolution with vertical axis, horizontal sections will cut both surfaces in circles whose plans are circles and whose elevations are lines, whilst vertical sections through the vertex of the cone cut the latter in lines and the sphere in circles. To avoid drawing the projections of these circles, which would in general be ellipses, we rabutt the plane and then draw the circles in their real shape. And so on in other cases.

Special attention should in all cases be paid to those points in which the tangents to the projection of the curve of intersection are parallel or perpendicular to the axis x , or where these projections touch the contour of one of the surfaces.

PERSPECTIVE.

§ 50. We have seen that, if all points in a figure be projected from a fixed centre to a plane, each point on the projection will be the projection of all points on the projecting ray. A complete representation by a single projection is therefore possible only when there is but one point to be projected on each ray. This is the case by projecting from one plane to another, but it is also the case if we project the *visible* parts of objects in nature; for every ray of light meeting the eye starts from that point in which the ray, if we follow its course from the eye, backward meets for the first time any object. Thus, if we project from a fixed centre the *visible* part of objects to a plane or other surface, then the outlines of the projection would give the same impression to the eye as the outlines of the things projected, provided that one eye only be used and that this be at the centre of projection. If at the same time the light emanating from the different points in the picture could be made to be of the same kind—that is, of the same color and intensity and of the same kind of polarization—as that coming from the objects themselves, then the projection would give sensibly the same impression as the objects themselves. The art of obtaining this result constitutes a chief part of the technique of a painter, who includes the rules which guide him under the name of perspective, distinguishing between *linear* and *aerial* perspective,—the former relating to the projection, to the *drawing* of the out-

lines, the latter to the coloring and the shading off of the colors in order to give the appearance of distance. We have to deal only with the former, which is in fact a branch in geometry consisting in the applications of the rules of projection.

§ 51. Our problem is the following: There is given a figure in space, the plane of a picture, and a point as centre of projection; it is required to project the figure from the point to the plane.

From what has been stated about projection in general it follows at once that the projection of a point is a point, that of a line a line. Further, the projection of a point at infinity in a line is in general a finite point. Hence parallel lines are projected into a pencil of lines meeting at some finite point. This point is called the *vanishing point of the direction* to which it belongs. To find it, we project the point at infinity in one of the parallel lines; that is, we draw through the eye a line in the given direction. This cuts the picture plane in the point required.

Similarly all points at infinity in a plane are projected to a line (§ 6) which is called the *vanishing line of the plane* and which is *common to all parallel planes*.

All lines parallel to a plane have their vanishing points in a line, viz., in the vanishing line of the plane.

All lines parallel to the picture plane have their vanishing points at infinity in the picture plane; hence *parallel lines which are parallel to the picture plane appear in the projection as parallel lines in their true direction.*

The projection of a line is determined by the projection of two points in it, these being very often its vanishing point and its trace on the picture plane. The projection of a point is determined by the projection of two lines through it.

These are the general rules which we now apply. We suppose the picture plane to be vertical.

§ 52. Let (Fig. 21) S be the centre of projection, where the eye is situated, and which in perspective is called the *point of sight*, ABKL the picture plane, ABMN a horizontal

FIG. 21.

plane on which we suppose the objects to rest of which a perspective drawing is to be made. The lowest plane which contains points that are to appear in the picture is generally selected for this purpose, and is therefore called the ground plane, or sometimes the geometrical plane. It cuts the picture plane in a horizontal line AB called the ground line or base line or fundamental line of the picture. A horizontal line SV, drawn through the eye S perpendicular to the picture, cuts the latter at a point V called the centre of the picture or the centre of vision. The distance SV of the eye from the picture is often called the distance simply, and the height ST of the eye above the ground the height of the eye.

The vanishing line of the ground plane, and hence of every horizontal plane, is got by drawing the projecting rays from S to the points at infinity in the plane—in other words, by drawing all horizontal rays through S. These lie in a horizontal plane which cuts the picture plane in a horizontal line DD' through the centre of vision V. This line is called the horizon in the picture. It contains the vanishing points of all horizontal lines, the centre of vision V being the vanishing point of all lines parallel to SV, that is perpendicular to the picture plane. To find the vanishing point of any other line we draw through S the ray projecting the point at infinity in the line; that is, we draw through S a ray parallel to the line, and determine the point where this ray cuts the picture plane. If the line is given by its plan on the ground plane and its elevation on the picture plane, then its vanishing point can at once be determined; it is the vertical trace of a line parallel to it through the eye (comp. § 35).

§ 53. To have construction in a single plane, we suppose the picture plane turned down into the ground plane; but before this is done the ground plane is pulled forward till, say, the line MN takes the place of AB, and then the picture plane is turned down. By this we keep the plan of the

FIG. 22.

figure and the picture itself separate. In this new position the plane of the picture will be that of the paper (Fig. 22). On it are marked the base line AB, the centre of vision V, and the horizon DD', and also the limits ABKL of the actual picture. These, however, need not necessarily be marked. In the plan the picture plane must be supposed to pass through A₁B₁, and to be perpendicular to the ground plane. If we further suppose that the horizontal plane through the eye which cuts the picture plane in the horizon DD' be turned down about the horizon, then the centre of sight will come to the point S, where VS equals the distance of the eye.

To find the vanishing point of any line in a horizontal plane, we have to draw through S a line in the given direction and see where it cuts the horizon. For instance, to find the vanishing points of the two horizontal directions which make angles of 45° with the horizon, we draw through S lines SD and SD' making each an angle of 45° with the line DD'. These points can also be found by making VD and VD' each equal to the distance SV. The two points D, D' are therefore called the distance points.

§ 54. Let it now be required to find the perspective P of a point P_1 (Figs. 21 and 22) in the ground plane. We draw through P_1 two lines of which the projection can easily be found. The most convenient lines are the perpendicular to the base line, and a line making an angle of 45° with the picture plane. These lines in the ground plan are P_1Q_1 and P_1R_1 . The first cuts the picture at Q_1 , or at Q, and has the vanishing point V; hence QV is its perspective. The other cuts the picture in R_1 , or rather in R, and has the vanishing point D; its perspective is RD. These two lines meet at P which is the point required. It will be noticed that the line $QR = Q_1R_1 = Q_1P_1$ gives the distance of the point P behind the picture plane. Hence if we know the point Q where a perpendicular from a point to the picture plane cuts the latter, and also the distance of the point behind the picture plane, we can find its perspective. We join Q to V, set off QR to the right equal to the distance of the point behind the picture plane, and join R to the distance point to the left; where RD cuts QV is the point P required. Or we set off QR to the left equal to the distance and join R' to the distance point D' to the right.

If the distance of the point from the picture should be very great, the point R might fall at too great a distance from Q to be on the drawing. In this case we might set off QW equal to the n th part of the distance and join it to a point E, so that VE equals the n th part of VD. Thus if $QW = \frac{1}{3}QR$ and $VE = \frac{1}{3}VD$, then WE will again pass through P. It is thus possible to find for every point in the ground plane, or in fact in any horizontal plane, the perspective; for the construction will not be altered if the ground plane be replaced by any other horizontal plane. We can in fact now find the perspective of every point as soon as we know the foot of the perpendicular drawn from it to the picture plane, that is, if we know its elevation on the picture plane, and its distance behind it. For this reason it is often convenient to draw in slight outlines the elevation of the figure on the picture plane.

Instead of drawing the elevation of the figure we may also proceed as follows. Suppose (Fig. 23) A_1 to be the projection of the plan of a point A . Then the point A lies vertically above A_1 because vertical lines appear in the perspective as vertical lines (§ 51). If then the line VA_1 cuts the picture plane at Q , and we erect at Q a perpendicular in the picture plane to its base and set off on it QA_2 equal to the

FIG. 23.

real height of the point A above the ground plane, then the point A_2 is the elevation of A and hence the line A_2V will pass through the point A . The latter thus is determined by the intersection of the vertical line through A_1 and the line A_2V .

This process differs from the one mentioned before in this that the construction for finding the point is not made in the horizontal plane in which it lies, but that its plan is constructed in the ground plane. But this has a great advantage. The perspective of a horizontal plane from the picture to the line at infinity occupies in the picture the space between the line where the plane cuts the picture and the horizon, and this space is the greater the farther the plane is from the eye, that is, the farther its trace on the picture plane lies from the horizon. The horizontal plane through the eye is projected into a line, the horizon; hence no construction can be performed in it. The ground plane on the other hand is the lowest horizontal plane used. Hence it offers most space for constructions, which consequently will allow of greater accuracy.

§ 55. The process is the same if we know the coördinates of the point, viz., we take in the base line a point O as origin, and we take the base line, the line OV , and the perpendicular OZ as axes of coördinates. If we then know the coördinates x, y, z measured in these directions, we make $OQ=x$, set off on QV a distance QA such that its real length $QR=y$, make $QA_2=z$, and find A as before. This process might be simplified by setting off to begin with along OQ and OZ scales in their true dimensions and along OV a scale obtained by projecting the scale on OQ from D to the line OV .

§ 56. The methods explained give the perspective of any point in space. If lines have to be found, we may determine the perspective of two points in them and join these, and this is in many cases the most convenient process. Often, however, it will be advantageous to determine the projection of a line directly by finding its vanishing point. This is especially to be recommended when a number of parallel lines have to be drawn.

The perspective of any curve is in general a curve. The projection of a conic is a conic, or in special cases a line. The perspective of a circle may be any conic, not necessarily an ellipse. Similarly the perspective of the shadow of a circle on a plane is some conic.

§ 57. A few words must be said about the determination of shadows in perspective. The theory of their construction is very simple. We have given, say, a figure and a point L as source of light. We join the point L to any point of which we want to find the shadow and produce this line till it cuts the surface on which the shadow falls. These constructions must in many cases first be performed in plan and elevation, and then the point in the shadow has to be found in perspective. The constructions are different according as we take as the source of light a finite point (say, the flame of a lamp), or the sun, which we may suppose to be at an infinite distance.

If, for instance, in Fig. 23, A is a source of light, $EHGF$ a vertical wall, and C a point whose shadow has to be determined, then the shadow must lie on the line joining A to C . To see where this ray meets the floor we draw through the source of light and the point C a vertical plane. This will cut the floor in a line which contains the feet A_1, C_1 of the perpendiculars drawn from the points A, C to the floor,

or the plans of these points. At C' , where the line A_1C_1 cuts AC , will be the shadow of C on the floor. If the wall $EHGF$ prevents the shadow from falling on the floor, we determine the intersection K of the line A_1C_1 with the base EF of the wall and draw a vertical through it, this gives the intersection of the wall with the vertical plane through A and C . Where it cuts AC is the shadow C'' of C on the wall.

If the shadow of a screen CDD_1C_1 has to be found we find the shadow D' of D which falls on the floor; then D_1D' is the shadow of D_1D and $D'C'$ is the shadow on the floor of the line DC . The shadow of D_1D , however, is intercepted by the wall at L . Here then the wall takes up the shadow, which must extend to D' as the shadow of a line on a plane is a line. Thus the shadow of the screen is found in the shaded part in the figure.

§ 58. If the shadows are due to the sun, we have to find first the perspective of the sun, that is, the vanishing point of its rays. This will always be a point in the picture plane; but we have to distinguish between the cases where the sun is in the front of the picture, and so behind the spectator, or behind the picture plane, and so in front of the spectator. In the second case only does the vanishing point of the rays of the sun actually represent the sun itself. It will be a point above the horizon. In the other case the vanishing point of the rays will lie below the horizon. It is the point where a ray of the sun through the centre of sight S cuts the picture plane, or it will be the shadow of the eye on the picture. In either case the ray of the sun through any point is the line joining the perspective of that point to the vanishing point of the sun's rays. But in the one case the shadow falls away from the vanishing point, in the other it falls towards it. The direction of the sun's rays may be given by the plan and elevation of one ray.

For the construction of the shadow of points it is convenient first to draw a perpendicular from the point to the ground and to find its shadow on the ground. But the shadows of verticals from a point at infinity will be parallel; hence they have in perspective a vanishing point L_1 in the horizon. To find this point, we draw that vertical plane through the eye which contains a ray of the sun. This cuts the horizon in the required point L_1 and the picture plane in a vertical line which contains the vanishing point of the sun's rays themselves. Let then (Fig. 24) L be the vanishing

FIG. 24.

ing point of the sun's rays, L_1 be that of their projection in a horizontal plane, and let it be required to find the shadow of the vertical column AH . We draw AL_1 and EL ; they meet at E' , which is the shadow of E . Similarly we find the shadows of F, G, H . Then $E'F'G'H'$ will be the shadow of the quadrilateral $EFGH$. For the shadow of the column itself we join E' to A , etc., but only mark the outlines; $F'B$, the shadow of BF , does not appear as such in the figure.

If the shadow of E has to be found when falling on any other surface we use the vertical plane through E , determine its intersection with the surface, and find the point where this intersection is cut by the line EL . This will be the required shadow of E .

§ 59. If the picture is not to be drawn on a vertical but on another plane—say, the ceiling of a room—the rules given have to be slightly modified. The general principles will remain true. But if the picture is to be on a curved surface the constructions become somewhat more complicated. In the most general case conceivable it would be necessary to have a representation in plan and elevation of the figure required and of the surface on which the projection has to be made. A number of points might also be found by calculation, using coördinate geometry. But into this we do not enter. As an example we take the case of a panorama, where the surface is a vertical cylinder of revolution, the eye being in the axis. The ray projecting a point A cuts the cylinder in two points on opposite sides of the eye,

hence geometrically speaking every point has two projections; of these only the one lying on the half ray from the eye to the point can be used in the picture. But the other has sometimes to be used in constructions, as the projection of a line has to pass through both. Parallel lines have two vanishing points which are found by drawing a line of the given direction through the eye; it cuts the cylinder in the vanishing points required. This operation may be performed by drawing on the ground the plan of the ray through the foot of the axis, and through the point where it cuts the cylinder a vertical, on which the point required must lie. Its height above is easily found by making a drawing of a vertical section on a reduced scale.

Parallel planes have in the same manner a vanishing curve. This will be for horizontal planes a horizontal circle of the height of the eye above the ground. For vertical planes it will be a pair of generators of the cylinder. For other planes the vanishing curves will be ellipses having their centre at the eye.

The projections of vertical lines will be vertical lines on the cylinder. Of all other lines they will be ellipses with the centre at the eye. If the cylinder be developed into a plane, then these ellipses will be changed into curves of sines. Parallel lines are thus represented by curves of sines which have two points in common. There is no difficulty in making all the constructions on a small scale on the drawing board and then transferring them to the cylinder.

§ 60. A variety of instruments have been proposed to facilitate perspective drawings. If the problem is to make a drawing from nature then a camera obscura or, better, Wollaston's camera lucida may be used. Other instruments are made for the construction of perspective drawings. It will often happen that the vanishing point of some direction which would be very useful in the construction falls at a great distance off the paper, and various methods have been proposed of drawing lines through such a point. For some of these see Stanley's *Descriptive Treatise on Mathematical Drawing Instruments*.

Literature.—Descriptive geometry dates from Monge, whose *Géométrie Descriptive* appeared in 1800. Before his time plans and elevations, especially of buildings, had been in use, and rules had been developed to determine by construction from drawings the shapes of the stones required in buildings, especially in vaults and arches. These rules were reduced to a consistent method by Monge.

Perspective was investigated much earlier, as painters felt the need of it. Its beginnings date from the time of the Greek mathematicians, but its modern development from the time of the Renaissance, when the first books on the subject appeared in Italy. Albrecht Dürer also published a treatise on it and constructed a machine for making perspective drawings of objects. Of later writers we mention in the 17th century Desargues, and in the 18th Dr. Brook Taylor, whose *Linear Perspective* appeared first in 1715 and *New Principles of Linear Perspective* in 1719. At present perspective is generally treated as a special case of projection, and included in books on descriptive geometry.

For the literature of projection in general, we refer to the list of books given under GEOMETRY, vol. x. p. 366. For descriptive geometry and perspective, see Monge, *Géométrie Descriptive*; Leroy, *Traité de Géométrie Descriptive*; Fiedler, *Darstellende Geometrie*; Gournerie, *Traité de Perspective*; Mannheim, *Géométrie Descriptive* (1880) and *Éléments de la Géométrie Descriptive* (1882); J. Woolley, *Descriptive Geometry* (1856), which is based on Leroy's work, and is the only scientific publication on the subject in England. A number of other publications with titles such as "Practical Geometry" and "Geometrical Drawing" contain more or less full explanations of the methods of descriptive geometry. These are based generally on Euclidian as opposed to projective geometry, and are therefore in their theoretical part more or less unsatisfactory. We may mention Angel, *Practical Plane Geometry and Projection*. (O. H.)

PROJECTION OF THE SPHERE. See GEOGRAPHY.

PROME, a district in Pegu division, British Burmah, India, between 18° 30' and 19° 15' N. lat., and 94° 40' and 96° E. long., containing an area of 2887 square miles. It occupies the whole breadth of the valley of the Irawadi, between Thayet district on the north and Henzada and Tharawadi districts on the south, and originally extended as far as the frontier of the province of Burmah, but in 1870 Thayet was formed into an independent jurisdiction. There are two mountain ranges in Promé, which form respectively the eastern and western boundaries. The Arakan Yoma extends along the whole of the western side, and that portion of the district lying on the right bank of the Irawadi is broken up by thickly wooded spurs running in a southeasterly direction, the space for cultivation being but limited and confined to the parts adjacent to the river. On the eastern side lies the Pegu Yoma, and north and northeast of the district its forest-covered spurs form numerous valleys and

ravines, the torrents from which unite in one large stream called the Na-weng river. The most important of the plains lie in the south and southwest portions of Promé, and extend along the whole length of the railway that runs between the towns of Pongdé and Promé; they are mostly under cultivation, and those in the south are watered by a series of streams forming the Myitma-kha or upper portion of the Hlaing. There are in addition large tracts of land covered by tree-jungle which are available for cultivation. The principal river is the Irawadi, which intersects the district from north to south; next in importance are the Tha-ni and its tributaries and the Na-weng system of rivers. In the hills near the capital the soil is of Tertiary formation, and in the plains it is of alluvial deposit. The climate is much drier than other districts in British Burmah. The total rainfall in 1882 was 49.64 inches.

In 1881 the population was 322,342 (161,433 males and 160,909 females). Buddhists and Jains numbered 313,261, Mohammedans 1795, Hindus 978, Christians 336, Aborigines 5818, and Parsees 5. More than two-thirds of the population are agriculturists. The chief towns are Promé (see below), and Shwe-doung and Pongdé, with 12,373 and 6727 inhabitants respectively. The chief products are rice, teak, cutch, silk, sugar cane, cotton, tobacco, and sesame oil; but the staple product is rice, which is cultivated mainly in the Pongdé and Shwe-doung townships. The total area under cultivation in 1882 was 234,222 acres. One of the most important manufactures is silk; others are ornamental boxes, coarse brown sugar, and cutch. The gross revenue of the district in 1882 amounted to about £92,000 [\$447,120], of which over a third was derived from the land.

The early history of the once flourishing kingdom of Promé, like that of the other states which now form portions of the province of British Burmah, is veiled in obscurity. Fact and fable are so interwoven that it is impossible to disentangle the true from the false. After the conquest of Pegu in 1758 by Aloung-bhúra, the founder of the third and present dynasty of Ava kings, Promé remained a province of the Burman kingdom till the close of the second Burmese war in 1853, when the province of Pegu was annexed to British territory.

PROME, chief town of the above district, on the left bank of the Irawadi, had a population in 1881 of 28,813 (males 14,982, females 13,831). To the south and southeast the town is closed in by low pagoda-topped hills, on one of which stands the conspicuous gilded Shwe Tsan-daw. The town was taken by the British in 1825 and again in 1852, on both occasions with hardly any opposition from the Burmese. In 1862 it was almost entirely destroyed by fire, and was afterwards relaid out in straight and broad streets. It was erected into a municipality in 1874, and since then great improvements have been made. Its principal manufactures are silk cloths and lacquer ware.

PROMETHEUS, son of the Titan Iapetus by the sea nymph Clymene, is the chief "culture hero," and, in some accounts, the Demiurge of Greek mythical legend. As a culture-hero or inventor and teacher of the arts of life, he belongs to a wide and well-known category of imaginary beings. Thus Quat, Quahteah, Pundjel, Maui, Ioskeha, Cagn, Wainamoinen, and an endless array of others represent the ideal and heroic first teachers of Melanesians, Ahts, Australians, Maoris, Algonquins, Bushmen, and Finns. Among the lowest races the culture-hero commonly wears a bestial guise, is a spider (Melanesia), an eagle hawk (Australia), a coyote (northwest America), a dog or raven (Thlinkeet), a mantis insect (Bushman), and so forth, yet is endowed with human or even superhuman qualities, and often shades off into a permanent and practically deathless god. Prometheus, on the other hand, is purely anthropomorphic. He is the friend and benefactor of mankind. He defends them against Zeus, who, in accordance with a widely diffused mythical theory, desires to destroy the human race and supplant them with a new and better species, or who simply revenges a trick in which men get the better of him. The pedigree and early exploits of Prometheus are given by Hesiod (*Theog.*, 510-616).

On a certain occasion gods and men met at Mecone. The business of the assembly was to decide what portions of slain animals the gods should receive in sacrifice. On one side Prometheus arranged the best parts of the ox covered with offal, on the other the bones covered with fat. Zeus was invited to make his choice, chose the fat, and found only bones beneath. A similar fable of an original choice, in which the chooser is beguiled by appearances, recurs in Africa and North America. The native tribes adapt it to explain the different modes of life among themselves and white men. In wrath at this trick, according to Hesiod, or in other versions for the purpose of exterminating the remnants of people who escaped the deluge of Deucalion, Zeus never bestowed, or later withdrew, the gift of fire. In his "philanthropic fashion," Prometheus stole fire, concealed in a hollow fennel stalk (Hesiod, *Op. et Di.*), and a fennel stalk is still used in the Greek islands as a means of carrying a light (*cf.* Pliny, xiii. 22). According to some legends he gained the fire by holding a rod close to the sun. Probably the hollow fennel stalk in which fire was carried got its place in myth from the very fact of its common use.

We thus find Prometheus in the position of the fire-bringer, or fire-stealer, and so connected with a very wide cycle of similar mythical benefactors. Among the Murri of Gippsland, to begin with a backward people, the fire-stealer was a man, but he became a bird. *Tow-e-ra*, or fire, was in the possession of two women who hated the blacks. A man who loved men cajoled the women, stole fire when their backs were turned, and was metamorphosed into "a little bird with a red mark on its tail, which is the mark of fire." The fire-bringer in Brittany is the golden or fire-crested wren. Myths like this kill two birds with one stone, and at once account for the possession of fire by men and for the marking of certain animals regarded as fire-bringers.¹ In another Australian legend fire was stolen by the hawk from the bandicoot, and given to men. In yet another a man held his spear to the sun, and so got a light. A bird is fire-bringer in an Andaman island tale, and a ghost in another myth of the same island.² In New Zealand, Mani stole fire from Maui, the lord of fire. He used a bird's intervention. Among the Ahts, in North America,³ fire was stolen by animals from the cuttle-fish. Among the Thlinkets, Yehl, the raven-god, was the fire-stealer. Among the Cahrocs, the coyote steals fire from "two old women." Among the Aryans of India, Soma is stolen by birds, as water is among the Thlinkets, and mead in the Edda.⁴ Fire concealed himself, in the Veda, was dragged from his hiding place by Matarigvan, and was given to the priestly clan of Bhṛigu. We also hear that Matarigvan "brought fire from afar" (*R. V.*, iii. 9, 5), and that Bhṛigu found fire lurking in the water (*R. V.*, x. 46, 2).⁵

In considering the whole question, one must beware of the hasty analogical method of reasoning too common among mythologists. For example, when a bird is spoken of as the fire-bringer we need not necessarily conclude that, in each case the bird means lightning. On the other hand, the myth often exists to explain the cause of the markings of certain actual species of birds. Again, because a hero is said to have stolen or brought fire, we need not regard that hero as the personification of fire, and explain all his myth as a fire-myth. The legend of Prometheus has too often been treated in this fashion, though he is really a culture hero, of whose exploits, such as making men of clay, fire-stealing is no more than a single example. This tendency to evolve the whole myth of Prometheus from a belief that he is personified fire, or the fire-god, has been intensified by Kuhn's ingenious and plausible etymology of the name Προμηθεύς. The Greeks derived it from προμηθεύς, "provident," and connected it with such other words as προμηθεύμαι, προμήθεια. They had also the proper name Ἐπιμηθεύς

for the slow-witted brother of Prometheus who turned all the hero's wisdom to foolishness. Against these very natural etymologies the philologists support a theory that Prometheus is really a Greek form of *pramantha* (Skt.), the fire-stick of the Hindus. The process of etymological change, as given by Steinthal, was this. The boring of the perpendicular in the horizontal fire-stick, whereby fire was kindled, was called *manthana*, from *math*. "I shake." The preposition *pra* was prefixed, and you get *pramantha*. But Matarigvan was feigned to have brought Agni, fire, and "the fetching of the god was designated by the same verb *mathnāmi* as the proper earthly boring" of the firestick. "Now this verb, especially when compounded with the preposition *pra*, gained the signification to tear off, snatch to oneself, rob."⁶ Steinthal goes on—"Thus the fetching of Agni became a robbery of the fire, and the *pramātha* (fire-stick) a robber. The gods had intended, for some reason or other, to withhold fire from men; a benefactor of mankind stole it from the gods. This robbery was called *pramātha*; *pramāthya-s* is 'he who loves boring or robbery, a borer or robber.' From the latter words, according to the peculiarities of Greek phonology, is formed Προμηθεύς, Prometheus. He is therefore a fire-god," etc. Few things more ingenious than this have ever been done by philologists. It will be observed that "forgetfulness of the meaning of words" is made to account for the Greek belief that fire was stolen from the gods. To recapitulate the doctrine more succinctly, men originally said, in Sanskrit (or some Aryan speech more ancient still), "fire is got by rubbing or boring;" nothing could have been more scientific and straightforward. They also said, "fire is brought by Matarigvan;" nothing can be more in accordance with the mythopœic mode of thought. Then the word which means "etched" is confused with the word which means "bored," and gains the sense of "robbed." Lastly, fire is said (owing to this confusion) to have been stolen, and the term which meant the common savage fire-stick is by a process of delusion conceived to represent, not a stick, but a person, Prometheus, who stole fire. Thus then, according to the philologists, arose the myth that fire was stolen, a myth which, we presume, would not otherwise have occurred to Greeks. Now we have not to decide whether the Greeks were right in thinking that Prometheus only meant "the foresighted wise man," or whether the Germans know better, and are correct when they say the name merely meant "fire-stick." But we may, at least, point out that the myth of the stealing of fire and of the fire-stealer is current among races who are not Aryan, and never heard the word *pramantha*. We have shown that Thlinkets, Ahts, Andaman Islanders, Australians, Maoris, South Sea Islanders, Cahrocs, and others all believe fire was originally stolen. Is it credible that, in all their languages, the name of the fire-stick should have caused a confusion of thought which ultimately led to the belief that fire was obtained originally by larceny? If such a coincidence appears incredible, we may doubt whether the belief that is common to Greeks and Cahrocs and Ahts was produced, in Greek minds by an etymological confusion, in Australia, America, and so forth by some other cause. What, then, is the origin of the widely-diffused myth that fire was stolen? We offer a purely conjectural suggestion. No race is found without fire, but certain races⁷ are said to have no means of artificially reproducing fire; whether this be true or not, certainly even some civilized races have found the artificial reproduction of fire very tedious. Thus we read (*Od.*, v. 488-493), "As when a man hath hidden away a brand in the black embers at an upland farm, one that hath no neighbor nigh, and so saveth the seed of fire that he may not have to seek a light elsewhere,

even so did Odysseus cover him with the leaves." If, in the Homeric age, men found it so hard to get the seed of fire, what must the difficulty have been in the earliest dawn of the art of fire-making? Suppose, then, that the human groups of early savages are hostile. One group lets its fire go out, the next thing to do would be to borrow a light from the neighbor, perhaps several miles off. But, if the neighbors are hostile, the unlucky group is cut off from fire, *igni interdictur*. The only way to get fire in such a case is to steal it. Men accustomed to such a precarious condition might readily believe that the first possessors of fire, wherever they were, set a high value on it, and refused to communicate it to others. Hence the belief that fire was originally stolen. This hypothesis at least explains all myths of fire-stealing by the natural needs, passions, and characters of men, "a jealous race," whereas the philological theory explains the Greek myth by an exceptional accident of changing language, and leaves the other widely diffused myths of fire-stealing in the dark. It would occupy too much space to discuss, in the ethnological method, the rest of the legend of Prometheus. Like the Australian Pundjel, and the Maori Tiki, he made men of clay. He it was who, when Zeus had changed his wife into a fly, and swallowed her, broke open the god's head and let out his daughter Athene. He aided Zeus in the struggle with the Titans. He was punished by him on some desolate hill (usually styled Caucasus) for fire-stealing, and was finally released by Heracles.

His career may be studied in Hesiod, in the splendid *Prometheus Vincitur* of Æschylus, with the *scholia*, in Heyne's *Apollodorus*, in the excursus (1) of Schüzius to the Æschylean drama, and in the frequently quoted work of Kuhn. The essay of Steinthal may also be examined (Goldziher, *Myth. Hebr.*, Engl. transl., p. 363-392), where the amused student will discover that "Moses is a Pramanthas," with much else that is learned and convincing. PRONGBUCK. See ANTELOPE, vol. ii. p. 91, and Plate I. Fig. 6.

PRONY, GASPARD CLAIR FRANÇOIS MARIE RICHE DE (1755-1839), a celebrated French engineer, was born at Chamelet, in the department of the Rhone, 22d July, 1755, and was educated at the *École des Ponts et Chaussées*. His *Mémoire sur la poussée des voûtes* published in 1783, in defence of the principles of bridge construction introduced by his master Peronnet, attracted special attention. Under Peronnet he was engaged in restoring the fort of Dunkirk in 1785, and in erecting the bridge of Louis XVI. in 1787. The laborious enterprise of drawing up the famous *Tables du Cadastre* was entrusted to his direction in 1792, and in 1798 he was appointed director at the *École des Ponts et Chaussées*. He was employed by Napoleon to superintend the engineering operations both for protecting the province of Ferrara against the inundations of the Po and for draining and improving the Pontine Marshes. After the Restoration he was likewise engaged in regulating the course of the Rhone, and in several other important works. He was made a baron in 1828, and a peer in 1835. He was also a member of the principal academies and scientific societies of Europe. He died at Lyons 31st July, 1839.

PROPAGANDA, or Sacred Congregation de *Propaganda Fide*, is the name given to a commission of cardinals appointed for the direction of the missions of the Roman Church. The idea of forming such an institution was conceived by Pope Gregory XIII. and other pontiffs, but it was Gregory XV. (1621-1623) who, after having sought counsel from cardinals and information concerning the state of religion in various countries from apostolic nuncios and superiors of religious orders, published, 22d July, 1622, the bull *Inscrutabile* by which he founded the Congregation of Propaganda and provided means for its continuance.

The cardinal vicar and the cardinal secretary of state were amongst its first members. Additional privileges were granted it by other bulls; and all the pontifical colleges founded up to that date as well as those which should afterwards be founded for the propagation of the faith were declared subject to the Propaganda. The deliberations of this body, embracing a great variety of important questions, when formulated in decrees and signed by the cardinal prefect and the secretary were declared by Urban VIII., in 1634, to have the force of apostolic constitutions, which should be inviolably observed. The cardinal prefect is the head of the Congregation, and as such governs the Catholic missions of the world; the secretary is assisted by five subalterns (*minutanti*), who act as heads of departments, and these again are assisted by inferior employes (*scrittori*). The more important acts of the Congregation, which are discussed in weekly meetings by the cardinal prefect and the officials, are submitted to the pope for his supreme decision. The archives of the institution were transferred, in 1660, from the Vatican to the Palazzo Ferrattini in the Piazza di Spagna, Rome, which is the seat of the Congregation. They form a valuable collection of historical, ethnographical, and geographical documents, embracing a period of two hundred and fifty years, and serve as a record of past events and of precedents to be followed in decisions on questions that may arise. The funds of the institution were supplied in the first instance by Gregory XV. and by private bequests. Cardinal Barberini, brother of Urban VIII., provided for eighteen places in perpetuity for students, Mgr. Vives for ten. Pope Innocent XII. bequeathed to it 150,000 crowns in gold; Clement XII. gave it 70,000 crowns. In the second assembly of the Congregation it was proposed and accepted as a rule, that prelates on being raised to the dignity of cardinal should pay for a ring offered them by the pope a sum which was at first fixed at 545 golden *scudi*, and which is now 600 Roman *scudi* [about \$630]. Large donations were made to the Propaganda by Catholics in England, Scotland, Ireland, the United States, Spain and Italy. The cardinal prefect administers the property of the institution in the name of the Congregation. To provide for the affairs of the Church of the Oriental Rite, Pius IX., in 1862, appointed a special Congregation with its own secretary, consultants and officials.

The primary purpose of the Propaganda being to secure laborious and pious missionaries, colleges for their education and training were established. Chief amongst these is the Propaganda or Urban College in Rome, so named from Urban VIII. It is a general missionary seminary for the whole world. Here students are received from all foreign nations, and there are special foundations for Georgian, Persian, Chaldean, Syrian, Coptic, Brahman, Abyssinian, Armenian, Greek and Chinese students, as well as for students from England, Ireland, America and Australia, although these last have special colleges in Rome. After the age of fourteen each student takes an oath to serve the missions during his whole life in the ecclesiastical province or vicariate assigned to him by the Congregation, to which he must send annually an account of himself and of his work. He is maintained and clothed free of expense. His studies embrace the full course of Greek, Latin and Italian letters, some of the chief Oriental languages, as Hebrew, Syriac, Arabic, Armenian, and, when necessary, Chinese. There are also schools for the teaching of rational and natural philosophy, a complete course of theology, and the institutions of canon law. Besides this principal seminary, the Propaganda has colleges dependent on it both in Rome and in other countries, under the direction of regular and secular priests. From its beginning it had at its disposition national colleges—such as the English, founded by Gregory XIII.; the Irish, by Cardinal Ludovisi in 1628; the Scotch, by Clement VIII. in 1600; the German and Hungarian;

the American, of the United States, opened by Pius IX. in 1859; the Greek, founded by Gregory XIII.; the Armenian, recently established by Leo XIII.; and the Bohemian, opened 4th November, 1884. The jurisdiction of the Propaganda extends over the English colleges of Lisbon and Valladolid, the Irish college of Paris, and the American of Louvain. Until recently it had the Chinese college of Naples, transformed by the Italian Government, and the Illyrian college of Loreto, suppressed by the same Government; and it still has the Albanian pontifical college of Scutari. Besides these, other colleges serve for the education of missionaries for the Propaganda, as the college of SS. Peter and Paul in Rome, founded by Pius IX., in Milan the seminary of St. Calocero for all foreign missions, and at Genoa the College Brignole Sale for Italian emigrants to America. The institutions at Verona for central Africa are the support of the missions in the Soudan. Chief of all the seminaries is that of Paris which, for two centuries has supplied missionaries for India and China. To these is committed the vast college of the island of Pulo Penang, where young men from China and neighboring countries are trained to the priesthood. In Paris many missionaries are taken from the French seminary directed by the fathers of the Congregation of the Holy Ghost, who go to French colonies. At Lyons is the college for African missions. In Belgium there are the colleges of Foreign Missions, of the Immaculate Conception, and of St. Francis Xavier for Chinese missions. In Holland there was recently established the college of Stiel, whose students go to China. In All Hallows College, Ireland, the students are educated for the missions in Australia, Canada and the Cape of Good Hope. In England a seminary has grown up within a few years at Mill Hill, which has already supplied priests to the missions of Borneo and Madras. Previous to the late changes in Rome, the Propaganda had dependent upon it the college of Reformed Minors in S. Pietro in Montorio, the Carmelites in S. Pancrazio (suppressed), the Minor Observants of S. Bartolomeo all'Isola recently re-established, the Conventuals (suppressed), and the Irish Minor Franciscans of St. Isidore. Outside of Rome there were also colleges of regulars for the missions, as Ocaña in Spain, Sernache in Portugal, and others. The Propaganda, in the establishment of vicariates or new episcopal sees, has always encouraged the formation, as soon as circumstances would permit, of seminaries for the education of a native clergy, and frequently these have flourished, as the community of the "Houses of God" (*case di Dio*) in Tongking, the seminaries of Sze-chuen, of Peking, and of Nanking. The first step taken in a new mission is the erection of a chapel, followed by the opening of a school and an orphanage. As numbers increase, and more priests come to the new mission, they are united under a superior invested with special powers by the Propaganda—in fact a prefect apostolic. As churches increase and the faith spreads, a vicar apostolic, who is a bishop *in partibus*, is appointed, and, if the progress made requires it, the mission is erected into an episcopal diocese. Such has been the method of proceeding in the American and Canadian missions; such, in part, what has happened in India, China and Africa. Through these, whether prefects or vicars apostolic or bishops, the orders of the Propaganda, which are those of the head of the church, are transmitted to the faithful, and they are the ordinary centres of its correspondence, although it does not disdain the reports furnished by the humblest members of the Christian flock. The prelates furnish exact reports to the Propaganda of the progress and circumstances of the faith in their various missions.

The material means for the diffusion of the faith are supplied in the first place by special grants from the revenues of the Propaganda and from various associations in Europe. The greatest part is furnished by the

society for the propagation of the faith of Paris and Lyons. This society is independent of the Propaganda, relying wholly on the energy of the two central councils of Paris and Lyons and on the charity of the faithful, though it attends to the suggestions of the Propaganda, which indicates to it the needs of new missions. Contributions are also furnished by other associations, as that of the Holy Infancy, or that for the education of Oriental nations. Similar societies, occupied with the support of special missions, exist in Bavaria, Germany, and Austria. The Propaganda likewise takes care that, as soon as a mission is established, pious foundations are constituted by native Christians, and become the local property of the church, and so supply it with a stable and enduring vitality. Subscriptions from Europe are given only to the poorer missions, which, however, are very numerous. One of the most powerful aids adopted by the Propaganda in the diffusion of the faith is the printing-press. The missionaries are required to study the languages of the countries to which they are sent and exhorted to publish books in these languages. Printing-presses are introduced into new missions. In China, what may be described as wooden stereotypes are employed for the printing of Catholic works in the Chinese language. Early in its career the Congregation of Propaganda established at its seat in Rome the celebrated Polyglott Printing Press, and gave it a character of universality. There people of all nations—the Copt, the Armenian, the Arab, the Hebrew, the Japanese, and the native of Malabar—may find books in their native tongue and in their special type. Although great progress has been made by other countries in polyglott printing, the Propaganda press still holds a high position.

The part of the world to which the cardinals of the Congregation of Propaganda first turned their attention was Asia. In no region of the globe has Christianity had greater difficulties to struggle against than in China. An ancient tradition exists, confirmed by documents, that in the early centuries of the Christian era Christianity had penetrated into and left traces in China. It was re-introduced in the 13th century by Franciscan fathers. It flourished at Peking for a time, but died out with the Mongolian dynasty, and China remained closed to Christian influences until 1555, when the Dominican father Gaspare della Croce introduced it into the province of Canton. After he was expelled came the Jesuits Rogeri and Ricci. They established a residence there in 1579, and were followed by Dominicans and Franciscans. These were succeeded a century later by the priests of the Paris seminary of foreign missions, in the last century by Augustinians and Lazarists, and in the present century by the missionaries of the seminary of St. Calocero of Milan. Two bishoprics were created in 1688, one at Nanking, the other at Peking, and the missions of Yun-nan and Sze-chuen founded. At the beginning of the 18th century the number of churches in the northern provinces reached 300, and of Christians 300,000. In 1803 a college for native clergy was opened in Sze-chuen, and the work of the Holy Infancy introduced. In 1837 the Portuguese patronage of Chinese missions was brought to an end, with the exception of that exercised over Macao, a Portuguese colony.

In 1310 B. Odorico di Friuli, a Franciscan, entered Tibet, and made many converts. In 1624 Father D'Andrada penetrated into the same country, but was not allowed to remain. Others followed, and were put to death. In 1847 the Propaganda entrusted to the seminary of foreign missions the task of entering Tibet, and in 1857 a vicariate apostolic was erected on the frontiers. In Mongolia, constituted a vicariate apostolic in 1840, many converts were made and several priests educated in the seminary of Siwang-se. This mission offers great hopes. It was divided into three vicariates in 1883, and is entrusted to the Belgian congregation of the Immaculate Heart of Mary. The Manchuria mission was made a vicariate in 1839; in

1854 a church, S. Maria ad Nives, was erected, and many other churches have since been built for the increasing mission. In 1592 an attempt was made to Christianize Corea; but repeated persecutions crushed out the germs of Christianity. Its first neophyte, its first native priest, its first bishops, and its first European missionaries were martyrs. From 1784 to 1789 4000 Coreans were converted, but their number was greatly reduced by persecution. In 1831 a vicariate was established; in 1835 the number of Christians was 6280; in 1861 they reached 18,000; but in 1866 persecution began anew. Christianity was introduced into Japan in 1549 by S. Francis Xavier. In less than fifty years there were in Japan a bishopric, 380 churches, and 30,000 professing Christians. Persecution broke out in 1601, and in 1614 became so fierce that the priests were put to death and the people dispersed. In 1640 all Europeans, missionaries included, were banished from Japan, this proscription continuing for two centuries. Missionaries were admitted in 1843, but so jealously watched that little good was accomplished. In 1863 a treaty was concluded between the emperor of the French and the Japanese Government permitting the preaching of the gospel. The first church was built after a lapse of two centuries; the number of catechumens soon reached 10,000; other churches were constructed; and the descendants of the old Christians, who had still preserved the faith, came forth from their concealment. A new persecution broke out in 1870; many Christians apostatized; a great number died of hunger, and many were exiled. Peace was established in 1873. The vicariate apostolic was divided in 1876 into two—the northern and southern vicariates. By the treaty of Peking, concluded between the French and Chinese Governments, liberty of religion was granted in the Chinese empire and a new era opened. In 1873, in the eighteen provinces of the Chinese empire, the number of Catholics was 410,644, with 4054 centres, 1220 churches and public chapels, 294 bishops and missionaries, 252 native priests, 137 European female religious and 924 native, 104 orphanages with 6853 orphans, and 947 schools frequented by 10,624 pupils. In spite of popular tumults and persecutions these numbers have increased in late years.

In the year of its foundation the Propaganda established a prefecture apostolic in Burmah. Italian Barnabites penetrated into the country in 1721, and two of them, Fathers Gallizio and Nericì, were put to death. The priests of the seminary of foreign missions continue the work, and three vicariates have been established. Malacca was visited by S. Francis Xavier, and was for a long time under the Portuguese jurisdiction; but a vicariate was established in 1841 and entrusted to the Paris seminary, which has a college in Penang for natives of China and neighboring countries. Jesuits, Dominicans, and Franciscans brought the Catholic faith to Siam in the 16th century. The first vicar apostolic was appointed in 1678. A terrible persecution of Christians, causing great loss, broke out in 1772, and it was not till 1821 that the missions were restored. The vicariate was divided into two in 1841. In the missions of the Anamite empire, comprising Tongking and Cochin China, and the missions to Cambodia and to the Laos people, Christianity may be said to have had its birth and its growth in blood, so fierce and numerous have the persecutions been. In the 14th century the faith was introduced by Dominicans and Franciscans, and the first mission established in 1550 by Gaspare della Croce. The Jesuits came in 1615, and in 1665 the Propaganda established here the priests of the seminary of foreign missions. A few years later the number of Christians in the southern provinces of Cochin China was 17,000, with 60 churches. Persecution followed persecution. The Dominican Father Francesco Gil, after nine years' imprisonment, was martyred in 1745. All foreigners were driven from the

kingdom in 1825, and in 1826 an edict was issued against the Christians. What seemed a war of extermination was undertaken in 1833. Missionaries sought refuge in tombs and grottos, whence they issued by night to administer the sacraments. Mgr. Delgado, vicar apostolic of Western Tong-king, Mgr. Henares, his coadjutor, several Chinese priests, Mgr. Barie, vicar apostolic of Eastern Tong-king (about to be consecrated bishop), and an incredible number of lay persons of all ranks were put to death. In 1842 the cause of the beatification and sanctification of the Anamite martyrs was introduced by the Sacred Congregation of Rites. Persecution was renewed in 1844; the exiled missionaries and prelates returned though a price was put upon their heads. Christianity was proscribed throughout all Anam in 1848; native priests were exiled, and European clergy cast into the sea or the nearest river. Nevertheless the vicariate of Cambodia was founded in 1850, and Eastern Cochin China was made a separate vicariate. A new edict appeared in 1851, again enjoining that European priests should be cast into the sea, and natives, unless they trampled upon the cross, severed in two. The missionaries Schaeffer and Bonnard were put to death; the vicars apostolic perished of hunger; the mass of Christians were imprisoned or exiled. In 1856 and 1857 whole Christian villages were burned and their inhabitants dispersed. The edict of 1862 enjoined that Christians should be given in charge to pagans, that their villages should be burned and their property seized, and that on one cheek should be branded the words "false religion." In 1863 the number of martyrs had reached forty thousand, without reckoning those driven into the woods, where they perished. Nevertheless, the Anamite church, steeped in blood, has increased, and is regarded as the brightest gem of the Propaganda missions.

India is one of the most extensive fields in which the missionaries have labored. Previous to the founding of the Propaganda the Jesuits had established several missions in India. The introduction of vicars apostolic consolidated the basis of Christianity, and now twenty-three vicariates apostolic and a delegate apostolic direct the spiritual affairs of this great country. In Africa, Catholic missionaries were the first travellers, two centuries prior to Livingstone and Stanley. The earliest mission was that of Tunis (1624). The missions of the Cape of Good Hope were entrusted to the clergy of Mauritius; the Reformati and the Observants went to Egypt, the Carmelites to Mozambique and Madagascar, the Capuchins and Jesuits to Ethiopia and Abyssinia. The spiritual affairs of Africa are directed by one metropolitan and thirty-six bishops, vicars, and prefects apostolic. The progress of Catholicism in Australia is evident from the fact that two metropolitans, those of Melbourne and Sydney, with twelve suffragans direct its ecclesiastical affairs. While the missionary field of the Propaganda embraces Asia, Africa, Oceania, and both Americas, as well as England, Ireland, Scotland, Holland, Germany, Norway and Sweden, Iceland, Greenland, Switzerland, Albania, Macedonia, Greece, Turkey, etc., perhaps the most splendid results of its work are to be met with in the United States and in Canada. In 1632 many Catholics settled with Lord Baltimore in Maryland. A century and a half later, in 1789, they had so increased that the Congregation of Propaganda withdrew them from the jurisdiction of the vicar apostolic of London and formed a new see in Baltimore, comprising the territory of the United States. In 1808 the sees of New York, Philadelphia, Boston, and Bardstown (Louisville) were erected, and Baltimore was made the metropolitan diocese. At the end of 1884 there were twelve metropolitans and seventy-six bishops and vicars apostolic in the United States. In 1659 Mgr. François de Laval was the first vicar apostolic of Canada; shortly afterwards the episcopal see

of Quebec was established. Now Canada has four metropolitan and sixteen suffragan sees.

The Italian Government, in virtue of the laws relating to ecclesiastical property of 1866, 1867, and 19th June, 1873, sold the Villa Moutalto, Frascati, belonging to the Propaganda, and placed the price in the Italian funds, paying interest to the Congregation. Other property of the congregation having been sold, a law-suit was entered upon and decided in the court of Cassation at Rome, 31st May, 1881, in favor of the Propaganda. Appeal was made to the tribunal of Ancona, where, 14th December, 1881, decision was given against the Propaganda. Appeal being again made, the Court of Cassation of Rome gave final judgment, 9th February, 1884, against the Propaganda. This sentence empowers the Italian government to sell the landed or immovable property of the Propaganda, place the proceeds in the Italian funds, and pay the interest to the Congregation. Protests against this act have been issued by Pope Leo XIII., by Cardinal Jacobini, secretary of state to the pontiff, by nearly all the Catholic bishops, and by innumerable thousands of lay Catholics and many Protestants. (D. J.)

PROPERTIUS, SEXTUS, the greatest elegiac poet of Rome, was born of a good Umbrian family, who were considerable landed proprietors in the fair and fertile region between Perugia and the river Clitumnus. The seat of the Propertii was at Asisium or Assisi, the birthplace of the famous St. Francis; and here also was Propertius born. The year of his birth is uncertain, and it has been variously placed between 57 and 44 B.C. We learn from one passage of Ovid that Propertius was his senior, but also his friend and companion; from another that he was third in the sequence of elegiac poets, following Gallus, who was born in 69 B.C., and Tibullus, whose birth has been assigned to 54 B.C., and immediately preceding Ovid himself, who, as he tells us elsewhere, was born in 43 B.C. We shall not be far wrong in supposing that he was born about 50 B.C., a date which also agrees well with the indications of the poems themselves. His early life was full of misfortune. He buried his father before his time; and grief was closely followed by poverty. After the battle of Philippi and the return of Octavian to Rome the victorious legions had to be provided for; their clamorous need and cupidity could only be appeased by wholesale agrarian confiscation, and the north of Italy had to be surrendered. In common with his fellow poets Virgil and Horace, Propertius was deprived of his estate; but, unlike these, he had no patrons at court, and he was reduced from opulence to comparative indigence. The widespread disaffection which these measures provoked was turned to account by Lucius Antonius, the brother of the triumvir, and his wife, the notorious Fulvia. The insurrection which is generally known as the *bellum Perusinum* from its only important incident, the fierce and fatal resistance of Perugia, deprived the poet of another of his relations, who was killed by brigands while making his escape from the lines of Octavian. The loss of his patrimony, however, thanks no doubt to his mother's providence, did not prevent Propertius from receiving a superior education. After or, it may be, during its completion he and she left Umbria for Rome; and there, about the year 34 B.C., he assumed the garb of manly freedom. He was urged to take up a pleader's profession; but the serious study went against the grain, and, like Ovid, he found in letters and gallantry a more congenial pursuit. Soon afterwards he made the acquaintance of Lycinna, about whom we know little beyond the fact that she subsequently excited the jealousy of Cynthia, and was subjected to all her powers of persecution (*vecundi*). This passing fancy was succeeded by a serious attachment, the object of which was the famous "Cynthia." Her real name was Hostia, and she was a native of Tibur. She was a courtesan of the superior class, somewhat older than Propertius, and seems to have been a woman of singular beauty and varied accomplishments. Her own predilections led her to literature; and in her society Propertius found the intellectual sympathy and encouragement which were essential for the develop-

ment of his powers. Her character as depicted in the poems, is not an attractive one; but she seems to have entertained a genuine affection for her lover. The intimacy began in 28 and lasted till 23 B.C. These six years must not, however, be supposed to have been a period of unbroken felicity. Apart from minor disagreements, an infidelity on Propertius's part excited the deepest resentment in Cynthia; and he was banished for a year. The quarrel was made up about the beginning of 25 B.C.; and soon after Propertius published his first book of poems and inscribed it with the name of his mistress. Its publication placed him in the first rank of contemporary poets, and amongst other things procured him admission to the literary circle of Mæcenas. The intimacy was renewed; but the old enchantment was lost. Neither Cynthia nor Propertius was faithful to the other. The mutual ardor gradually cooled; motives of prudence and decorum urged the discontinuance of the connection; and disillusion changed insensibly to disgust. Although this separation might have been expected to be final, it is not certain that it was so. It is true that Cynthia, whose health appears to have been weak, does not seem to have survived the separation long. But a careful study of the seventh poem of the last book, in which Propertius gives an account of a dream of her which he had after her death, leads us to the belief that they were once more reconciled, and that in her last illness Cynthia left to her former lover the duty of carrying out her wishes with regard to the disposal of her effects and the arrangements of her funeral. Almost nothing is known of the subsequent history of the poet. He was certainly alive in 16 B.C., as some of the allusions in the last book testify. And there are two passages in the letters of the younger Pliny in which he speaks of a descendant of the poet, one Passennus Paulus. Now in 18 B.C. Augustus carried the *Leges Juliae*, which offered inducements to marriage and imposed disabilities upon the celibate. It would seem therefore at least a natural conclusion that Propertius was one of the first to comply with the provisions of the law, and that he married and had at least one child, from whom the contemporary of Pliny was descended.

Propertius appears to have had a large number of friends and acquaintances, chiefly literary, belonging to the circle of Mæcenas. Amongst these may be mentioned Virgil, the epic poet Ponticus, Bassus (probably the iambic poet of the name), and at a later period Ovid. He does not seem to have come across Tibullus; and his relations with Horace were not particularly friendly. Horace may have regarded him as an interloper in the favor of Mæcenas, though there is nothing in the poems of Propertius to warrant the supposition. In person Propertius was pale and thin, as was to be expected in one of a delicate and even sickly constitution. He was very careful about his personal appearance, and paid an almost foppish attention to dress and gait. He was of a somewhat voluptuous and self-indulgent temperament, which shrank from danger and active exertion. He was anxiously sensitive about the opinion of others, eager for their sympathy and regard, and, in general, impressionable to their influence. His over-emotional nature passed rapidly from one phase of feeling to another; but the more melancholy moods predominated. A vein of sadness runs through his poems, sometimes breaking out into querulous exclamation, but more frequently venting itself in gloomy reflections and prognostications. He had fits of superstition which in healthier moments he despised. It must be added that the native weakness of his character was no doubt considerably increased by his infirm and delicate constitution.

The poems of Propertius, as they have come down to us, consist of four books containing 4046 lines of elegiac verse. The unusual length of the second one (1402 lines) has led Lachmann and other critics to suppose that it originally consisted of two books, and they have placed the beginning of the third book at ii. 10,

a poem addressed to Augustus. This theory somewhat modified, has been powerfully advocated by Th. Birt (*Das Antike Buchwesen*, pp. 413-426). He divides the poems into two parts,—a single book (lib. i.), published separately and called *Cynthia Monobiblos*, as in the MSS. and the lemma to Martial (xiv. 189), and a *Tetrabiblos Syntaxis*, a collection of four books, published together, consisting of the remainder of his poems. If this view is correct, the greater part of the first book of the *Syntaxis* must have been lost, as ii. 1-9 only contain 354 lines. The first book, or *Cynthia*, was published early in the poet's literary life, and may be assigned to 25 B.C. The date of the publication of the rest is uncertain, but none of them can have been published before 24 B.C., and the last, at any rate, was probably published posthumously. The subjects of the poems are threefold: (1) amatory and personal, mostly regarding Cynthia—seventy-two (sixty Cynthia elegies), of which the last book contains three; (2) political and social, on events of the day—thirteen, including three in the last book; (3) historical and antiquarian—six, of which five are in the last book.

The writings of Propertius are noted for their difficulty; and this has undoubtedly prejudiced his reputation as a poet. His style seems to unite every element by which a reader could be deterred. Not to speak of the unequal quality of his workmanship, in which curtness alternates with redundancy, and carelessness with elaboration, the indistinctness and discontinuousness of his thought is a serious strain upon the attention. An apparently desultory sequence of ideas, sudden and often arbitrary changes of subject, frequent vagueness and indirectness of expression, a peculiar and abnormal Latinity, a constant tendency to exaggeration, and an excessive indulgence in learned and literary allusions,—all these are obstacles lying in the way of a study of Propertius. But those who have the will and the patience to surmount them will find their trouble well repaid. In power and compass of imagination, in freshness and vividness of conception, in truth and originality of presentation, few Roman poets can compare with him. If these qualities are seldom eminent for long together, if his flights are rarely steady and sustained, this is matter for regret rather than cavil or even astonishment. Propertius was essentially incapable of self-criticism, constitutionally intolerant of the slow labor of the file. His work is ever best when done under the urgency of a supreme and rapid excitement, and when, so to say, the discordant qualities of his genius are fused together by the electric spark of an immediate inspiration. Two of his merits seem to have impressed the ancients themselves. The first is most obvious in the scenes of quiet description and emotion in whose presentation he particularly excels. Softness of outline, warmth of coloring, a fine and almost voluptuous feeling for beauty of every kind, and a pleading and almost melancholy tenderness—such were the elements of the spell which he threw round the sympathies of his reader, and which his compatriots expressed by the vague but expressive word *blanditia*. His *facundia*, or command of striking and appropriate language, is more noticeable still. Not only is his vocabulary very extensive, but his employment of it extraordinarily bold and unconventional. New settings of use, idiom, and construction continually surprise us, and, in spite of occasional harshness, secure for his style an unusual freshness and freedom. His handling of the elegiac couplet, and especially of its second line, deserves especial recognition. It is vigorous, varied, and even picturesque. In the matter of the rhythms, caesuras, and elisions which it allows, the metrical treatment is much more severe than that of Catullus, whose elegiacs are comparatively rude and barbarous; but it is not bound hand and foot, like that of the Ovidian distich, in a formal and conventional system. It only now remains

to call attention to the elaborate symmetry of construction which is observable in many of his elegies. Often indeed the correspondence between different parts of his poem is so close that critics have endeavored with more or less success to divide them into strophes.

Propertius's poems bear evident marks of the study of his predecessors both Greek and Latin, and of the influence of his contemporaries. He tells us himself that Callimachus and Philetas were his masters, and that it was his ambition to be the Roman Callimachus. We can trace obligations to Theocritus, Apollonius Rhodius, and other Alexandrines, but above all to Meleager, and amongst earlier writers to Homer, Pindar, Æschylus, and others. Amongst Latin writers he had read with more or less care the works of Ennius, Lucretius, the dramatists, and Catullus. We find coincidences too close to be fortuitous between his poems and those of Virgil, Horace, and Tibullus his contemporaries; but it is very possible the influence was reciprocal. Propertius's influence upon his successors was considerable. There is not a page of Ovid which does not show obligations to his poems, whilst other writers made a more modest use of his stores. Amongst these may be mentioned Manilius, Juvenal, Martial, Statius, Claudian, Seneca, and Apuleius.

The works of Propertius have come down to us in a far from perfect condition. Some of the poems have been lost; others are fragmentary; and most are more or less disfigured by corruptions. The manuscripts on which we have to rely are late and in several cases interpolated; and these circumstances, combined with the native difficulty of the poet's writing, make the task of his restoration and interpretation one of peculiar delicacy and difficulty.

Donatus (or Suetonius) in his life of Virgil, 30 (45), is the authority for the full name of Propertius. "Aurelius" and "Nauta," which are added in the MSS., are due to confusion with Prudentius, and a corrupt reading of iii. 19, 22 (Müller), (ii. 24, 22, Palmer). On the Propertii, see Mommsen in *Hermes*, iv, p. 370; Haupt, *Opusc.*, i. p. 282. Besides the Propertius Blæsus (the Passennus Paulus of Pliny), we hear of a C. Propertius who was *triumvir capitalis* and *proconsul* in the time of Augustus, and a Propertius Celer, a poor senator under Tiberius. Inscriptions of the Propertii have been found at Assisi, cf. Hertzberg, *Prop.*, i. pp. 10-12. Propertius tell us himself that his family was not "noble," iii. 32 (ii. 34), 55, 6, and iii. 19. l.c.—Mevania (Bevagna) and Hispellum (Spello) have been put forward as the birth-place of Propertius, but the poet's own expressions are decisive for Assisium. Apart from the question of reading in v. (iv.) 1, 125 (MSS. Assi.), the climbing walls of his town (*scandentes arces, scandens murus v.* (iv.) 1, 65 and l.c.) its nearness to Perugia, and its position close above the plain (i. 22, 9, 10) are altogether unsuitable to Spello and Bevagna. Ovid thus assigns Propertius his place: *successor fuit hic* (Tibullus), *tibi, Galle: Propertius illi* (Tibullus), *quartus ab his serie temporis ipse fui* (*Tr.* iv. 10, 53, 54); and again (*ib.*, ii. 467), his (to Tibullus and Propertius) *ego successi*. For Ovid's friendship with Propertius see below—v. 1, 121 sq. is the chief authority for the earlier events of his life. For the premature death of his father and the loss of his property, see 127 sq.:—*ossaque legisti non illa ætate legenda patris et in tenues cogeris ipse Lares, nam tibi cum multi uersarent rura iuueni abstulit exultas pertica tristis opes*. Elsewhere he says that he is non ita diues (iii. 19 (22), l.c.) and that he had *nulla domi fortuna relicta* iii. 32, 55, l.c. Indirect evidence such as his living on the Esquiline, iv. (iii), 23, 24, points to a competence. For the death of his kinsman, generally supposed to be the Gallus of i. 21, see i. 22, 5-8. Propertius's mother is mentioned in ii. 8, 39; iii. 13, 15; and in very affectionate terms in i. 11, 21. She was dead when iii. 13 (11) was written, i.e., six months after the publication of the first book. For the quality of Propertius's education, the poems themselves are the only, but a sufficient, testimony. For Lycinna see iv. 14 (iii. 15), 3-10, 43. Cynthia, or Hostia (Apul. *Apol.*, p. 415) of Tibur (v. (iv.) 7, 85), was the granddaughter (iv. 19 (iii. 20), 8), of L. Hostius, who wrote a poem on the Illyrian war of 178 B.C., of which some fragments are preserved. She was much older than Propertius (iii. 10 (ii. 18), 20). That she was a *meretrix* is clear from many indications—her accomplishments, her house in the Subura, the occurrence of scenes like those in i. 3, iii. 27 (ii. 29), the fact that Propertius

could not marry her, etc. For descriptions of her beauty see ii. 2, 5, *sq.*, and 3, 9, *sq.*: iii. 3, (ii. 13), 23, 24; her poetry, ii. 3, 21; and other accomplishments, i. 2, 27 *sq.*, iv. 19 (20) 7, 8. In character she was fickle (i. 15, ii. 6, etc.) greedy (iii. 8 (ii. 16), 11, 12, Cynthia non sequitur faeces, nec curat honores: semper amatorum ponderat una sinus), and fond of finery (ii. 3, 15, 16); her temper was violent, iv. 7, (iii. 8), etc., and led her to slander those who had offended her (i. 4, 18 *sq.*, etc. For the five years, see iv. (iii.) 25, 3, quinque tibi potui seruire fideliter annos; and for the year of separation, iv. 15, 11 (iii. 16), 9, peccaram semel, et totum sum pulsus in annum. The second separation is vouched for by the two last elegies of book iv. The evidence which v. (iv.) 7 furnishes in favor of a reconciliation is analyzed by Postgate (*Prop.*, *Introd.*, p. xxv. *sq.*).—v. 6 commemorates the celebration of the *ludi quinquennales*, and v. 11, 66, alludes to the consulship of P. Scipio in 16 B. C. For Passennus Paulus (or as an Assisi inscription calls him C. Passennus Sergius Paulus Propertius Blasus), see Pliny (*Ep.*, vi. 15), *municipes Propertii atque etiam inter maiores Propertium numerat*; (9, 22), in litteris ueteres aemulatur exprimit reddit: Propertium in primis a quo genus ducit, uera soboles eoque similima illi in quo ille praecipuus, si elegos eius in manum pumperis, leges opus tersum molle incundum et plane in Propertii domo scriptum.—ii. 1 and iv. (iii.) 9 are addressed to Maecenas, iii. 1 (ii. 10) to Augustus. Virgil is spoken of in the highest terms in iii. 32 (ii. 34), 61 *sq.* Other poems are addressed to Ponticus (i. 7, 9), Bassus (i. 4), Lynceus a tragic poet (iii. 32, ii. 34). Volpi conjectured (in his edition of Propertius, i. pp. xv. *sq.*) that he was the inquisitive fellow of Horace, *Sat.*, i. 9; but the conjecture is generally rejected on grounds of chronology. It has recently been re-discussed and rejected by Prof. A. Palmer in his edition of Horace's *Satires*, i. 9 (notes), p. 219. In *Ep.* vi. 87 *sq.*, however, Horace seems to make a direct attack on Propertius. On Propertius's personal appearance, see i. 22, 5, 21; pallorem nostrum. . . cur sim toto corpore nullus ego. A likeness of him has possibly been preserved in a double Hermes in the Villa Albani and the Vatican, which represents a young beardless Roman of a nervous and somewhat sickly appearance, in combination with a Greek poet, possibly Callimachus or Philetas (Visconti, *Iconograph. Romana*, plate 14, 3, 4; see E. Brizio, *Annal. dell' inst. arch.*, 1873, 105; C. Robert, *Arch. Zeit.*, 38, 35, (cited by Teuffel.) Ill health is proved, as well by the specific allusion of i. 15 as by the frequent references to death and burial—i. 19; ii. 1, 71 *sq.*; iii. 5, 1 (ii. 13, 17) *sq.* For his care about dress and the like, see ii. 4, 15, 16, (5, 6), neququam perfusa meis unguenta capillis ibat et expenso planta morata gradu. His character is mirrored in his poems. In particular it has had a great deal to do in moulding his vocabulary (Postgate, *Introd.*, p. xxxvi. *sq.*). For want of courage and energy, especially, see ii. 7, 14; iii. 12 (ii. 19), 17–24; and for superstitious leanings iii. 23 (ii. 27); ii. 4, 15, (25); v. (iv.) 5, 9, *sq.* The numbering of the books is one of the most vexed questions of Propertius; but it is not unlikely that Birt's conclusions will be ultimately accepted. The dates of the several poems are, where known, some guide towards determining that of the books: i. 8 seems to have been written about 27 B.C.; i. 6 not before 27 B.C.; ii. 1 in 25 B.C.; i. 8 after 27 B.C.; iii. 1 (ii. 10) in 24 B.C.; 29, 31, end of 28; 32 not before 28 B.C.; iv. (iii.) 17 (18) in or after 23 B.C.; so 3 (4), 4 (5), 11 (12), but 20 about 28 B.C.; v. (iv.) 6, 11 not before 16 B.C.; 3 in 23 B.C. For the evidence for believing book v. to be posthumous see Postgate, pp. liv., lv. It is beyond our limits to discuss the style and idiom of Propertius in full. For details see Hertzberg, *Introduction*, pp. 47, *sq.*; Postgate, *Introduction*, pp. lvii. *sq.* (literary style), lxxxviii. *sq.* (grammar and vocabulary), cxxvi. *sq.* for metre and prosody; also L. Müller's *Introduction*, pp. xlviii. *sq.* For ancient references to Propertius as a writer see Quint., x. 1. 93, where it is stated that some (not Quintilian) preferred him to Tibullus, *Op.*, A. A., iii. 333, *Tr.*, iii. 465 (blandus P.) v. 1, 17 (blandus), *Mart.*, xiv. 189 (faecundus P.) viii. 73, Pliny, *l.c.* above, *Stat.*, *Silv.*, i. 2, 253, *Vmbro Propertius antro*.—*Prop.*, iii. (iv.) 1, Callimachi manes et Coi sacra Philetæ, in uestrum, quaeso, me sinite ire nemus; v. (iv.) 1, *Vmbria Romani patria Callimachi*. But, as is well pointed out by Teuffel in his *History of Roman Literature*, Propertius's debt to Callimachus and Philetas is chiefly a formal one. Even into his mythological learning he breathes a life to which those dry scholars were complete strangers. For a summary account of his relations to his predecessors and contemporaries see Postgate, *Introd.* ch. v. Coincidences with Horace are quoted in Teuffel (§ 246, 2); with Catullus, M. Magnus, *Fleckeisen's Jahrbücher*, 115, p. 418; with Tibullus, A. Zingerle, *Ovid's Verhältnisse*, etc., i. 55, 93, 101, etc., with Virgil, *Nettlehip, Ancient Lives of Vergil*, p. 63, 64.

There is no existing MS. of Propertius older than the 14th cen-

tury. Up till the publication of Bährens's edition (1880), the Neapolitanus (N., now often called the Guelferbytanus) was regarded as the best. Bährens, however, maintained its worthlessness as compared with the concurrence of four other MSS. of his own collating: Vossianus, circa 1360 (A); Laurentianus, beginning of the 15th century (F); Ottoboniano-Vaticanus, end of 14th century (V); Daventriensis, 1410–20 (D.). Bährens's attack upon the Neapolitan was answered by H. Leo (*Rh. Mus.*, xxxi. 431), Ellis (*Amer. Journ. Phil.*, i. 389), Palmer (*Hermathena*, iv. 48–72). The contending merits of these MSS. have been examined by Solbisky (*Comm. Phil. Jenenses*, ii. 1883), with considerable care, and his conclusions as to the independent value both of N. and the consensus of D. V. are likely to be accepted.

The editio princeps of Propertius is that of 1472, Venice. Among the chief editions may be mentioned the following, those with notes being marked with an asterisk: *Scaliger (1577, etc.), *Broukhusius (2d ed. 1577), *Passeratius (1608), *Vulpius (1755, 2 vols.), *P. Burmann (and Santen) (1780), *Lachmann (1816; text only, 1829), *Jacob (1827), Hertzberg (1843–45, 2 vols.), *F. A. Paley (2d ed., 1872), L. Müller (1870), Haupt-Vahlen (1879), Bährens (1880), A. Palmer (1880); selections, with introduction, Postgate (1881). Those of Müller and Palmer are the editions cited throughout this article. It is impossible to cite the numerous programmes, dissertations, papers, etc., which have been published on subjects connected with Propertius. For fuller bibliographies it is sufficient to refer to Hertzberg, *Prop.*, i. pp. 248–59; Engelmann's *Bibliotheca Scriptorum Latinorum* (ed. Preuss, 1882); J. E. B. Mayor's *Bibliographical Clue to Latin Literature* (1875); W. Teuffel, *Geschichte d. Röm. Literatur* (2d ed., 1882; Eng. trans., 1873; sec. 246 gives an excellent account of Propertius); Pauly, *Real-Encyclopädie*, s.v. "Propertius." Reviews of recent Propertian literature are given in Bursian's *Jahresbericht* (1873), pp. 1447–54 (very meagre, and in the *Trans. Camb. Philol. Soc.*, 1880 (i. 372–82), 1881–82 (ii. 226–36).

The following translations into English verse are known: G. F. Nott, Book i. (published anonymously, 1872 [1781?—A. M. Ed.]); C. A. Elton, selections in his *Specimens of the Classic Poets*, vol. ii. p. 215 *sq.* (1814, reprinted along with the preceding and a prose version by P. J. F. Gantillon, in Bohn's series, 1848, 1883); C. R. Moore (London, 1870); J. Cranston (Edinburgh, 1875); F. A. Paley, verse translations from Book v. with notes (1866); also a few translations by Gray (the poet) first printed in Gosse's edition, vol. i. (1884). (J. P. P.)

PROPHET (προφήτης) is a word taken from the vocabulary of ancient Greek religion, which passed into the language of Christianity, and so into the modern tongues of Europe, because it was adopted by the Hellenistic Jews as the rendering of the Hebrew נָבִי (nābî, pl. nēbîm). The word therefore as we use it is meant to convey an idea which belongs to Hebrew and not to Hellenic belief; but when it first underwent this change of application the age of the nēbîm was long past, and the Jews themselves had a very imperfect conception of what they had been and done. Hence in actual usage the idea conveyed by the word prophet has never quite corresponded with its historical prototype; the prophets of early Christendom, for example, are not by any means exact counterparts of the Old-Testament prophets, and in general very various ideas have prevailed as to what a prophet is or should be, because up to quite a recent date the work of the Hebrew prophets has been habitually approached not in a purely historical spirit but under the influence of preconceived ideas.¹

In the present article no attempt will be made to follow those speculations about the nature of prophecy which belong to dogmatic theology rather than to history; but a brief sketch will be given (1) of the history of Hebrew prophecy (in supplement to what has been already said in the article ISRAEL or is to be found in the articles devoted to individual prophets), and (2)

¹ It does not appear that the original Hellenic associations of the word have had any sensible effect on these ideas. According to Plato (*Timæus*, p. 72) the name προφήτης ought properly to be confined to the interpreters employed to put an intelligible sense on the dreams, visions, or enigmatic utterances of the frenzied μάντις. But in ordinary Greek usage the prophet of any god is in general any human instrument through whom the god declares himself; and the tendency was "to reserve the name for unconscious interpreters of the divine thought, and for the ministers of the oracles in general" (Bouché-Leclercq, *Hist. de la Divination* [1880], ii. 11). This probably facilitated the adoption of the term by the Hellenists of Alexandria, for, when Philo distinguishes the prophet from the spurious diviner by saying that the latter applies his own inferences to omens and the like while the true prophet, rapt in ecstasy, speaks nothing of his own, but simply repeats what is given to him by a revelation in which his reason has no part (ed. Mangey, ii. 321 *sq.* 343; comp. i. 510 *sq.*), he follows the prevalent notion of the later Jews, at least in so far as he makes the function of the prophet that of purely mechanical reproduction; compare John xi. 51, and the whole view of revelation presupposed in the Apocalyptic literature. But in any case the Greek language hardly offered another word for an organ of revelation so colorless as προφήτης, while the condition of etymology among the ancients made it possible to interpret it as having a special reference to prediction (so Eusebius, *Dem. Ev.*, v., deriving it from προφαίνω).

of prophecy in the early Christian Church. To speak of more recent religious phenomena within Christendom which have claimed to be prophetic would carry us too far; for them the reader is referred to such articles as MONTANISM, ANABAPTISTS. The conception of prophecy on which the Mohammedan religion is built has been sufficiently explained in the life of Mohammed; borrowed, somewhat unintelligently, from later Judaism, it is radically different from that of the Old Testament, and when narrowly looked at lends no countenance to the statement often made, and at first sight plausible, that prophecy is a phenomena characteristic of Semitic religion in general.

1. *The Prophets of the Old Testament.*—The author of 1 Sam. ix. 9 tells us that "beforetime in Israel, when a man went to inquire of God, thus he spake, Come and let us go to the seer; for that he is now called a prophet (*nābi*) was beforetime called a seer." This remark is introduced to explain how his contemporaries spoke of Samuel. He was a "seer" (ver. 11), or, as he is also called (ver. 6 sq.), a "man of God," that is one who stood in closer relations to God than ordinary men; "all that he said was sure to come to pass," so that he could be consulted with advantage even in private matters like the loss of the asses of Kish. The narrative of 1 Sam. ix. is so vivid and exact that not many generations of oral tradition can have separated the writer from the events he records; it shows us therefore, at least broadly, what the word prophet meant in the early times of the Hebrew kingdom, and it shows us that it had acquired that meaning after the age of Philistine oppression in which Samuel lived, and to which his younger contemporaries Saul and David put an end. That this is the sense of the author, and that we must not suppose that the word prophet had merely become more common in his time and supplanted an older synonym, appears beyond question a few verses further down, where we see there were already in Samuel's time people known as *nebiim*, but that they were not seers. The seer, with his exceptional insight, is a man of prominent individuality and held in great respect: when Saul asks for the seer every one knows that there is only one person in the town whom he can mean. With the prophets it is quite otherwise; they appear not individually but in bands; their prophesying is a united exercise accompanied by music, and seemingly dance-music; it is marked by strong excitement, which sometimes acts contagiously, and may be so powerful that he who is seized by it is unable to stand, and, though this condition is regarded as produced by a divine afflatus, it is matter of ironical comment when a prominent man like Saul is found to be thus affected. Samuel in his later days appears presiding over the exercises of a group of *nebiim* at Ramah, where they seem to have had a sort of cenobium (Naioth), but he was not himself a *nābi*—that name is never applied to him except in 1 Sam. iii. 21, where it is plainly used in the later sense for the idea which in Samuel's own time was expressed by "seer."²

But again the *nebiim* seem to have been a new thing in Israel in the days of Samuel. Seers there had been of old as in other primitive nations; of the two Hebrew words literally corresponding to our seer, *rōeh* and *hōzeh*, the second is found also in Arabic, and seems to belong to the primitive Semitic vocabulary.³ But the enthusiastic band of prophets are nowhere mentioned before the time of Samuel; and in the whole previous history the word prophet occurs very rarely, never in the very oldest narratives, and always in that sense which we know to be later than the age of Samuel, so that the use of the term is due to writ-

ters of the age of the kings, who spoke of ancient things in the language of their own day. The appearance of the *nebiim* in the time of Samuel was, it would seem, as has been explained in the article ISRAEL, one manifestation of the deep pulse of suppressed indignant patriotism which began to beat in the hearts of the nation in the age of Philistine oppression, and this fact explains the influence of the movement on Saul and the interest taken in it by Samuel. The ordinary life of ancient Israel gave little room for high-strung religious feeling, and the common acts of worship coincided with the annual harvest and vintage feasts or similar occasions of natural gladness, with which no strain of abnormal enthusiasm could well be combined. It was perhaps only in time of war, when he felt himself to be fighting the battles of Jehovah, that the Hebrew was stirred to the depths of his nature by emotions of a religious color. Thus the deeper feelings of religion were embodied in warlike patriotism, and these feelings the Philistine oppression had raised to extreme tension among all who loved liberty, while yet the want of a captain to lead forth the armies of Jehovah against his foemen deprived them of their natural outlet. It was this tense suppressed excitement, to which the ordinary acts of worship gave no expression, which found vent in the enthusiastic services of the companies of prophets. In its external features the new phenomenon was exceedingly like what is still seen in the East in every *zikr* of dervishes—the enthusiasm of the prophets expressed itself in no artificial form, but in a way natural to the Oriental temperament. Processions with pipe and hand-drum, such as that described in 1 Sam. x., were indeed a customary part of ordinary religious feasts; but there they were an outlet for natural merriment, here they have changed their character to express an emotion more sombre and more intense, by which the prophets, and often mere chance spectators too, were so overpowered that they seemed to lose their old personality and to be swayed by a supernatural influence. More than this hardly lies in the expression "a divine spirit" (רוח אלהים), which is used not only of the prophetic afflatus but of the evil frenzy that afflicted Saul's later days. The Hebrews had a less narrow conception of the spiritual than we are apt to read into their records.

To give a name to this new phenomenon the Israelites, it would seem, had to borrow a word from their Canaanite neighbors. At all events the word *nābi* is neither part of the old Semitic vocabulary (in Arabic it is a late loan word), nor has it any etymology in Hebrew, the cognate words "to prophesy" and the like being derived from the noun in its technical sense. But we know that there were *nebiim* among the Canaanites; the "prophets" of Baal appear in the history of Elijah as men who sought to attract their god by wild orgiastic rites. In fact the presence of an orgiastic character is as marked a feature in Canaanite religion as the absence of it is in the oldest religion of Israel; but the new Hebrew enthusiasts had at least an external resemblance to the devotees of the Canaanite sanctuaries, and this would be enough to determine the choice of a name which in the first instance seems hardly to have been a name of honor.⁴ In admitting that the name was borrowed, we are not by any means shut up to suppose that the Hebrew *nebiim* simply copied their Canaanite neighbors. The phenomenon is perfectly intelligible without any such hypothesis. A wave of intense religious feeling passes over the land and finds its expression, according to the

¹ Sam. x. 5 sq., xix. 20 sq. In the latter passage read "they saw the fervor of the prophets as they prophesied, etc." (see Hoffmann in Stade's *Zeitschr.*, 1883, p. 89), after the Syriac.

² On grounds of text-criticism indeed both this passage and 1 Sam. xxviii., where at ver. 6 prophets appear as revealers (seers), are held to be no part of the old stock of the history of Samuel.

³ Hoffmann, *ut supra*, p. 92 sq.

⁴ If this account of the origin of the *nebiim* is correct (comp. Kuenen, *Prophets*, Eng. tr., p. 554 sq.), the etymological sense of the word נָבִי is comparatively unimportant. The root seems to mean "to start up," "to rise into prominence," and so "to become audible"; but the range of possible explanations of the noun which remains open is too great to give value to any conjecture. The leading views are collected in several of the books cited at the close of this article, and a fresh and interesting investigation is given in G. Hoffmann's article quoted above.

ordinary law of Oriental life, in the formation of a sort of enthusiastic religious order. The Nazarites and the Rechabites are parallel phenomena, though of vastly inferior historical importance.

The peculiar methods of the prophetic exercises described in 1 Samuel were of little consequence for the future development of prophecy. The heat of a first enthusiasm necessarily cooled when the political conditions that produced it passed away; and, if the prophetic associations had done no more than organize a new form of spiritual excitement, they would have only added one to the many mechanical types of hysterical religion which are found all over the East. Their real importance was that they embodied an intenser vein of feeling than was expressed in the ordinary feasts and sacrifices, and that the greater intensity was not artificial, but due to a revival of national sentiment. The worship of the local sanctuaries did nothing to promote the sense of the religious unity of Israel; Jehovah in the age of the Judges ran no small risk of being divided into a number of local Baals, givers of natural good things each to his own locality. The struggle for freedom called forth a deeper sense of the unity of the people of the one Jehovah, and in so doing raised religion to a loftier plane; for a faith which unites a nation is necessarily a higher moral force than one which only unites a township or a clan. The local worships, which subsisted unchanged during the greater part of the Hebrew kingship, gave no expression to this rise in the religious consciousness of the nation; on the contrary we see from the prophetic books of the 8th century that they lagged more and more behind the progress of religious thought. But the prophetic societies were in their origin one symptom of that upheaval of national life of which the institution of the human sovereign reigning under the divine King was the chief fruit; they preserved the traditions of that great movement; they were, in however imperfect a way, an organ of national religious feeling, and could move forward with the movement of national life. And so, though we cannot follow the steps of the process, we are not surprised to learn that they soon had an established footing in Israel, and that the prophets came to be recognized as a standing sacred element in society. What was their precise place in Hebrew life we hardly know, but they formed at least a religious class which in all its traditions represented the new national and not the old communal and particularistic life. One characteristic point which appears very early is that they felt themselves called upon to vindicate the laws of divine righteousness in national matters, and especially in the conduct of the kings, who were not answerable to human authority. The cases of Nathan and David in the matter of Uriah, of Elijah and Ahab after the judicial murder of Naboth, will occur to every one, and from the Hebrew standpoint the action of Gad in the matter of the census taken by David belongs to the same category. Such interventions with an Eastern king demanded great moral courage, for, though to some extent protected by their sacred character, the persons of the prophets were by no means legally inviolable (1 Kings xix. 2; xxii. 27; 2 Kings vi. 31). Another point of the first importance in the development of the class was the absorption into it of the old seers, which, as we have already seen, must have occurred comparatively early. The great prophecy of Nathan (2 Sam. vii.) is of too disputed a date to be cited in evidence, but already in David's time we find that Gad the *nabi* is also the king's seer (2 Sam. xxiv. 11; comp. 1 Sam. xxii. 5), and by and by it comes to be clearly understood that the prophets are the appointed organ of Jehovah's communications with His people or his king. The rise of this function of the prophets is plainly parallel with the change which took place under the kings in the position of the priestly oracle; the Torah of the priests now dealt rather with permanent and sacred ordinances than with the giving

of new divine counsel for special occasions. Jehovah's ever-present kingship in Israel, which was the chief religious idea brought into prominence by the national revival, demanded a more continuous manifestation of His revealing spirit than was given either by the priestly lot or by the rise of occasional seers; and where could this be sought except among the prophets? It does not of course follow that every one who had shared in the divine afflatus of prophetic enthusiasm gave forth oracles; but the prophets as a class stood nearer than other men to the mysterious workings of Jehovah, and it was in their circle that revelation seemed to have its natural home. A most instructive passage in this respect is 1 Kings xxii., where we find some four hundred prophets gathered together round the king, and where it is clear that Jehosaphat was equally convinced, on the one hand that the word of Jehovah could be found among the prophets, and on the other that it was very probable that some or even the mass of them might be no better than liars. And here it is to be observed that Micah, who proved the true prophet, does not accuse the others of conscious imposture; he admits that they speak under the influence of a spirit proceeding from Jehovah, but it is a lying spirit sent to deceive. The sublime and solitary figure of Elijah, whom we are apt to take as the typical figure of a prophet in the old kingdom, has little in common with the picture even of the true prophet which we derive from 1 Kings xxii.; and when his history is carefully and critically read it is found to give no reason to think that he stood in any close relation to the prophetic societies of his time. He is a man of God like Moses and Samuel, a man admitted to a strange and awful intimacy with the Most High, and like them he combines functions which in later times were distributed between prophet and priest. The fundamental idea that Jehovah guides His people by the word of revelation is older than the separation of special classes of theocratic organs; Moses indeed is not only prophet and priest but judge and ruler. But as the history goes on the prophet stands out more and more as the typical organ of revelation, the type of the man who is Jehovah's intimate, sharing His secrets (Amos iii. 7; Jer. xxiii. 22), and ministering to Israel the gracious guidance which distinguishes it from all other nations (Amos ii. 11; Hosea xii. 10, 13), and also the sentences of awful judgment by which Jehovah rebukes rebellion (Hos. vi. 5). The full development of this view seems to lie between the time of Elijah and that of Amos and Hosea,—under the dynasty of Jehu, when prophecy, as represented by Elisha and Jonah, stood in the fullest harmony with the patriotic efforts of the age. This growth in the conception of the prophetic function is reflected in parts of the Pentateuch which may be dated with probability as belonging to the period just named; the name of *nabi* is extended to the patriarchs as Jehovah's intimates (Gen. xx. 7), and Moses begins to be chiefly looked at as the greatest of prophets (Num. xi. xii.; Deut. xxxiv. 10), while Aaron and Miriam are also placed in the same class (Exod. xv. 20; Num. xii.) because they too are among the divinely favored leaders of Israel (comp. Micah vi. 4).¹

Elisha, the successor of Elijah, stood in much closer relations to the prophetic societies than his great mas-

¹ None of these passages belong to the very oldest thread of Pentateuchal story, and similarly Deborah is called prophetess only in the later account (Jud. iv. 4), not in the song (Jud. v.). It is characteristic that in Num. xi. the elders who receive a share in Moses's task also receive a share of his prophetic spirit (comp. the parallel 2 Kings ii. 9 sq.). In the older account (Exod. xviii.) this is not so. Again Moses differs from all other prophets in that Jehovah speaks to him face to face, and he sees the similitude of Jehovah. This is in fact the difference between him and Elijah (comp. Exod. xxxiii. 8-11 with 1 Kings xix. 13), but not between him and the great prophets of the 8th century (Isa. vi. 5). That prophecy was generally given in visions, dreams, and obscure sentences is true only of an early period. Amos still has frequent visions of a more or less enigmatic character, as Micah had, but there is little trace of this in the great prophets after him. On the psychological reasons for this see W. R. Smith, *Prophecy of Israel* (1882), p. 221 sq.

ter had done. As a man of practical aims he required a circle through which to work, and he found this among the prophets, or, as they are now called, the sons of the prophets. According to Semitic idiom "sons of the prophets" most naturally means "members of a prophetic corporation,"¹ which may imply that under the headship of Elisha and the favor of the dynasty of Jehu, which owed much to Elisha and his party, the prophetic societies took a more regular form than before. The accounts we have certainly point in this direction, and it is characteristic that in 2 Kings iv. 42 first fruits are paid to Elisha. But to an institution like prophecy national recognition, royal favor, and fixed organization are dangerous gifts. It has always been the evil fate of the Hebrews to destroy their own highest ideals by attempting to translate them into set forms, and the ideal of a prophetic guidance of the nation of Jehovah could not have been more effectually neutralized than by committing its realization to the kind of state church of professional prophets, "eating bread" by their trade (Amos vii. 12),² which claimed to inherit the traditions of Elijah and Elisha. The sons of the prophets appear to have been grouped round the leading sanctuaries, Gilgal, Bethel, and the like (comp. Hos. ix. 8), and to have stood in pretty close relation to the priesthood (Hos. iv. 5), though this comes out more clearly for the southern kingdom, where, down to the last days of Hebrew independence, the official prophets of Jerusalem were connected with the temple and were under the authority of the chief priest (Jer. xxix. 26). Since the absorption of the aborigines in Israel Canaanite ideas had exercised great influence over the sanctuaries—so much so that the reforming prophets of the 8th century regarded the national religion as having become wholly heathenish; and this influence the ordinary prophets, whom a man like Micah regards as mere diviners, had certainly not escaped. They too were, at the beginning of the Assyrian period, not much more different from prophets of Baal than the priests were from priests of Baal. Their God had another name, but it was almost forgotten that He had a different character.

The rise and progress of the new school of prophecy, beginning with Amos and continued in the succession of canonical prophets, which broke through this religious stagnation, has already been discussed in the article ISRAEL (vol. xiii. p. 420 *sq.*); for from Amos and still more from Isaiah downwards the prophets and their work make up the chief interest of Hebrew history. From this time, moreover, the prophets appear as authors; and their books, preserved in the Old Testament, form the subject of special articles (AMOS, HOSEA, etc.). A few observations of a general character will therefore suffice in this place.

Amos disclaimed all connection with the mere professional prophets, and in this he was followed by his successors. Formerly the prophets of Jehovah had been all on the same side; their opponents were the prophets of Baal. But henceforth there were two parties among the prophets of Jehovah themselves, the new prophets accusing the old of imposture and disloyalty to Jehovah, and these retaliating with a charge of disloyalty to Israel. We have learned to call the prophets of the new school "true" prophets and their adversaries "false"; and this is perfectly just if we take the appellations to mean that the true prophets maintained a higher and therefore a truer view of Jehovah's character, purpose, and relation to His people. But the false prophets were by no means mere common impostors; they were the accredited exponents of the common orthodoxy of their day—

and even of a somewhat progressive orthodoxy, for the prophets who opposed Jeremiah took their stand on the ground of Josiah's reformation, and plainly regarded themselves as conservators of the prophetic traditions of Isaiah, whose doctrine of the inviolability of Jehovah's seat on Zion was the starting point of their opposition to Jeremiah's predictions of captivity. No doubt there were many conscious hypocrites and impostors among the professional prophets, as there always will be among the professional representatives of a religious standpoint which is intrinsically untenable, and yet has on its side the prestige of tradition and popular acceptance. But on the whole the false prophets deserve that name, not for their conscious impostures, but because they were content to handle religious formulas which they had learned by rote as if they were intuitive principles, the fruit of direct spiritual experience, to enforce a conventional morality, shutting their eyes to glaring national sins, after the manner of professional orthodoxy, and in brief to treat the religious *status quo* as if it could be accepted without question as fully embodying the unchanging principles of all religion. The popular faith was full of heathenish superstition strangely blended with the higher ideas which were the inheritance left to Israel by men like Moses and Elijah; but the common prophets accepted all alike, and combined heathen arts of divination and practices of mere physical enthusiasm with a not altogether insincere pretension that through their professional oracles the ideal was being maintained of a continuous divine guidance of the people of Jehovah.

Amos and his successors accepted the old ideal of prophecy if they disowned the class which pretended to embody it. "The Lord Jehovah will do nothing, but He revealeth his secret to His servants the prophets." "By a prophet Jehovah brought Israel out of Egypt, and by a prophet" in each successive age Israel had been watched over and preserved. But in point of fact the function of the new prophecy was not to preserve but to destroy Israel, if Israel still meant the actual Hebrew nation with its traditional national life. Till Amos prophecy was optimist—even Elijah, if he denounced the destruction of a dynasty and the annihilation of all who had bowed the knee to Baal, never doubted of the future of the nation when only the faithful remained; but the new prophecy is pessimist—it knows that Israel is rotten to the core, and that the whole fabric of society must be dissolved before reconstruction is possible. And this it knows, not by a mere ethical judgment on the visible state of society, but because it has read Jehovah's secret written in the signs of the times and knows that He has condemned His people. To the mass these signs are unintelligible, because they deem it impossible that Jehovah should utterly cast off His chosen nation; but to those who know His absolute righteousness, and confront it with the people's sin, the impending approach of the Assyrian can have only one meaning and can point to only one issue, viz., the total ruin of the nation which has denied its divine head. It is sometimes proposed to view the canonical prophets as simple preachers of righteousness; their predictions of woe, we are told, are conditional, and tell what Israel must suffer if it does not repent. But this is an incomplete view; the peculiarity of their position is that they know that Israel as it exists is beyond repentance. Only, while they are hopeless about their nation they have absolute faith in Jehovah and his purpose. That cannot be frustrated, and, as it includes the choice of Israel as His people, it is certain that, though the present commonwealth must perish, a new and better Israel will rise from its grave. Not the reformation but the resurrection of Israel is the goal of the prophet's hope (Hos. vi. 1 *sq.*).

This of course is only the broadest possible statement of a position which undergoes many modifications in the hands of individual seers, but on the whole governs

¹ See G. Hoffmann, *Kirchenversammlung zu Ephesus* (1873), p. 89.

² Those who consulted the old seers were expected to make a present, 1 Sam. ix. 7 (Arabic *hobwānu-l-kāhin*; comp. Bokhari, iv. 219). Similar presents were brought to the older prophets (1 Kings xiv. 3), and first fruits were sometimes paid to a man of God; but the successors of Amos share his contempt for those who traded on their oracles (Mic. iii. 5 *sq.*).

all prophecy from Amos to Jeremiah. The position has, we see, two sides: on the one side the prophets are heralds of an inexorable judgment based on the demands of absolute righteousness; on the other they represent an assured conviction of Jehovah's invincible and gracious love. The current theological formula for this two-sided position is that the prophets are at once preachers of the law and forerunners of the gospel; and, as it is generally assumed that they found the law already written, their originality and real importance is made to lie wholly in their evangelical function. But in reality, as has been shown in ISRAEL and PENTATEUCH, the prophets are older than the law, and the part of their work which was really epoch-making for Israel is just the part which is usually passed over as unimportant. By emphasizing the purely moral character of Jehovah's demands from Israel, by teaching that the mere payment of service and worship at Jehovah's shrines did not entitle Israel's sins to be treated one whit more lightly than the sins of other nations, and by enforcing these doctrines through the conception that the approach of the all-destroying empire before which Israel must fall equally with all its neighbors was the proof of Jehovah's impartial righteousness, they gave for the first time a really broad and fruitful conception of the moral government of the whole earth by the one true God.¹

It is impossible to read the books of the older prophets, and especially of their protagonist Amos, without seeing that the new thing which they are compelled to speak is not Jehovah's grace but His inexorable and righteous wrath. That that wrath must be followed by fresh mercies is not in itself a new thought, but only the necessary expression of the inherited conviction that Jehovah, whom they preach as the judge of all the earth, is nevertheless, as past history has proved, the God who has chosen Israel as His people. That this is so appears most clearly in the fact that with Amos the prophecy of restoration appears only in a few verses at the end of his book, and in the still more instructive fact that neither he nor Hosea attempts to explain how the restoration which they accept as a postulate of faith is to be historically realized.² One point only in their picture of the great restoration appears to present the germ of an historical principle. The Israel of the future is to be one united nation as in the days of David. The Davidic kingdom is accepted by both prophets, and by Hosea even more explicitly than by Amos, as the type of the future kingdom of Jehovah. But one sees from the way in which this thought is handled that it is the idea of that kingdom as it was in days of old which is before the prophet's mind; the actual state of Judah, which was not religiously better than the greater Israel, though it perhaps still possessed elements of greater political and social stability, was not such as to suggest the thought that when Samaria fell the continuity of Jehovah's relations with His people could be preserved at Jerusalem. It was in the great northern kingdom—still Israel *par excellence*—not in the petty region that had remained loyal to David, that the drama of divine justice and mercy was to be acted to its end: to Hosea, at least in his later prophecies, the fate of Judah does not appear separable from that of the northern realm—when Israel and Ephraim fall by their iniquity Judah must fall with them (Hos.

v. 5). Thus even on this side there is no real bridge over the chasm that separates the total ruin impending over the Israel of the present from the glorious restoration of the Israel of the future. There is a unity in the divine purpose, of which judgment and mercy are the two poles, but there is as yet no conception of an historical continuity in the execution of that purpose, and therefore no foundation laid for the maintenance of a continuous community of faith in the impending fall of the nation.

From this we can see the enormous importance of the work of Isaiah as it has been exhibited in the article ISRAEL, vol. xiii. p. 423 sq.; his doctrine of the remnant, the holy seed, never lost to the nation in the worst times, never destroyed by the most fiery judgments, supplies the lacking element of continuity between the Israel of the present and of the future. Jehovah's kingdom cannot perish even for a time; nay, Isaiah argues that it must remain visible, and visible not merely in the circle of the like-minded whom he had gathered round him and who formed the first germ of the notion of the church, but in the political form of a kingdom also. Zion at least, the sacred hearth of Jehovah, the visible centre of his kingdom, must remain inviolable; it can never be delivered into the hands of the Assyrian. Thus, with Isaiah in the days of Sennacherib's invasion, the prophetic word became again, as it had been in the days of the Syrian wars, "the chariots and horsemen of Israel," the stay and strength of all patriotic hope.

Yet even at this crisis the resemblance between Isaiah and Elisha, between the new prophecy and the old, is more apparent than real. Elisha still stands firmly planted on the old national conception of the religion of Jehovah; his ideals are such as do not lie beyond the range of practical politics. In doing battle against the Tyrian Baal he is content with a reformation for which the whole nation can be heartily won, because it makes no radical change in their inherited faith and practices of worship. And in stimulating resistance to Syria he is still the prophet of the old "God of the hosts of Israel"—a God who works deliverance by the thews and sinews of his earthly warriors. But Isaiah's ideal of religion was one which could never have been realized by a political movement; to root out all idols, all superstitions inconsistent with his lofty conception of the just King of Israel, who cares not for sacrifice and oblation, who can be acceptably approached through no religion of rote, whose sovereignty can receive practical recognition only by a thoroughgoing reformation of all parts of social life—this was an ideal which could not be carried out by the mere education and concentration of any forces inherent in the nation. The true Israel of Isaiah is not an historical possibility; it is a transcendental ideal for which he himself demands as a preliminary condition an outpouring of Jehovah's spirit on king (Isa. xi. 2) and people (Isa. xxxii. 15), working an entire moral regeneration. And so too it is not through the material organization of the Judæan kingdom that Isaiah looks for deliverance from Assyria. He sees with absolute clearness the powerlessness of the little realm against that great empire: the Assyrian must fall, and fall before Jerusalem, that Jehovah alone may appear to all the earth as the one true God, while all the idols appear as vain to help their worshippers; but he falls by no earthly sword, but before the direct interposition of Jehovah Himself. These conceptions break through the old particularistic idea of Jehovah and His religion at every point. Zion is now not the centre of a mere national cult, but the centre of all true religion for the whole world; and more than once the prophet indicates not obscurely that the necessary issue of the great conflict between Jehovah and the gods of the heathen must be the conversion of all nations, the disappearance of every other religion before the faith

¹ It must not be supposed that this conception necessarily came into force as soon as it was recognized that Jehovah was the creator of the universe. That the national or tribal god is the creator is an idea often found in very low religions. To us God's sovereignty over nature often seems the hardest thing to conceive; but to primitive peoples who know nothing of laws of nature His moral sovereignty is a much more difficult conception. In the older literature of the Hebrews the nearest approach to the thought of Amos and Hosea is not Gen. ii., iii., but Gen. xviii. 25.

² Hosea ii. 14 sq., xi. 10 sq. are not solutions of this difficulty, as appears from their metaphorical form. They tell us that Jehovah will call His people and that they will answer; but this is only putting in another form the axiom that the gifts and calling of God are without repentance.

of the God of Israel. But this all-conquering religion is not the popular Jehovah worship; why then can the prophet still hold that the one true God is yet the God of Israel, and that the vindication of His God-head involves the preservation of Israel? Not because His providence is confined to Israel—it embraces all nations; not because he shows any favoritism to Israel—He judges all nations by the same strict rule. If Israel alone among nations can meet the Assyrian with the boast “with us is God,” the reason is that in Zion the true God is known¹—not indeed to the mass, but to the prophet and to the “holy seed” which forms the salt of the nation. The interpretation which Isaiah puts on this fact depends on the circumstance that at that date religion had never been conceived as a relation between God and individuals, or as a relation between God and a purely spiritual society, but always as a relation between a deity and some natural social group—a stock, a tribe, a nation. It was therefore only as the God of Israel that the true God could be known within Israel; and so on the one hand the little society of faith—which had not in reality the least tinge of political coherence—is thought of as yet forming the true kernel of the nation *qua* nation, while on the other hand the state of Judah profits by the prophetic religion inasmuch as the nation must be saved from destruction in order that the prophetic faith—which is still bound up with the idea of the nation—may not be dissolved. This connection of ideas was not of course explicitly before the prophet’s mind, for the distinctive features of a national religion could not be formulated so long as no other kind of religion had ever been heard of. When we put down in black and white the explicit details of what is involved in Isaiah’s conclusion of faith we see that it has no absolute validity. True religion can exist without having a particular nation as its subject as soon as the idea of a spiritual community of faith has been realized. But till this idea was realized Isaiah was right in teaching that the law of continuity demanded that the nation within which Jehovah had made Himself known to His spiritual prophets must be maintained as a nation for the sake of the glory of God and the preservation of the “holy seed.”

The catastrophe of Sennacherib’s army, in which the doctrine of the inviolability of Zion received the most striking practical confirmation, was welcomed by Isaiah and his disciples as an earnest of the speedy in-bringing of the new spiritual era. But these hopes were not fulfilled. The prophetic teaching had indeed produced a profound effect; to the party of reaction, as the persecution under Manasseh showed, it seemed to threaten to subvert all society; and we can still measure the range and depth of its influence in the literary remains of the period from Isaiah to the captivity, which include Micah vi. 1–8, and that noble essay to build a complete national code on the principle of love to God, righteousness, and humanity—the legislation of Deuteronomy. Nay more, the reception of the book of Deuteronomy by king and people in the eighteenth year of Josiah shows what a hold the prophetic teaching had on the popular conscience; it was no small triumph that there was even a passing attempt to introduce such a code as the law of the land. But it was one thing to touch the conscience of the nation and another to change its heart and renew its whole life. That no code could do, and, as every practical government must adapt itself to actualities and not to a purely ideal standard, it must have appeared at once that the attempt to govern by prophetic ideas was only sewing a new piece on an old garment. The immediate result of Josiah’s reformation was the complete dissolution of anything that could be called a political party of

prophetic ideas; the priests and the ordinary prophets were satisfied with what had been accomplished; the old abuses began again, but the nation had received a reformed constitution and there was nothing more to be said.

Thus it was that, though beyond question there had been a real advance in the average ethical and spiritual ideas of the people since the time of Isaiah, Jeremiah found himself more isolated than Isaiah had ever been. Even in that earliest part of his book which is mainly a recapitulation of his experiences and work in the reign of Josiah, his tone is one of absolute hopelessness as to the future of the nation. But we should quite misunderstand this pessimism if we held it to mean that Jeremiah saw no signs of private morality and individual spiritual convictions among his people. To him as a prophet the question was whether Israel as a nation could be saved. In Isaiah’s days the answer had been affirmative; there appeared to be at least a potentiality of national regeneration in the holy seed when once it should be cleansed from the chaff by a work of judgment. But, now a century of respite had been granted, the Chaldeans were at the gates, and there was no sign of valid national repentance. The harvest was past, the season of ripe fruits was over, and still Israel was not saved (Jer. viii. 20). The time of respite had been wasted, all attempts at national reformation had failed; how should Jehovah spare a nation which had shown no tokens of fitness to discharge the vocation of Jehovah’s people? The question was not whether there was still a faithful remnant but whether that remnant was able to save the state as a state, and this Jeremiah was forced to deny. Nay every attempt at genuine amendment was frustrated by the dead weight of a powerful opposition, and when the first captivity came it was precisely the best elements of Judah that went into captivity and were scattered among the nations (xxiv. 5; xxiii. 2 *sq.*). And so the prophet was compelled to teach that the immediate future of Israel was a blank, that the state as a state was doomed. He did not even dare to intercede for such a nation (vii. 16); though Moses and Samuel stood pleading for it before Jehovah, He could not but cast it out of His sight (xv. 1). It was the death-struggle of the idea of a national religion (vi. 8); the continuity of true faith refused to be longer bound up with the continuity of the nation. Still indeed the New Testament idea of a purely spiritual kingdom of God, in this world but not of it, is beyond the prophet’s horizon, and he can think of no other vindication of the divine purpose than that the true Israel shall be gathered again from its dispersion. But the condition of this restoration is now changed. To gather the dispersed implies a call of God to individuals, and in the restored Israel the covenant of Jehovah shall be not merely with the nation but with men one by one, and “they shall no more teach every one his neighbor saying, Know the Lord, for all shall know Me from the least of them even to the greatest of them” (xxxi. 33 *sq.*). In a word, when the nation is dissolved into its individual elements the continuity and ultimate victory of true faith depends on the relation of Jehovah to individual souls, out of which the new state shall be built up (Jer. iii. 14).

Thus, for the first time in the world’s history, the ultimate problem of faith is based on the relation of God to the individual believer; and this problem Jeremiah is compelled to face mainly in relation to his own personality, to assure himself that his own faith is a true possession and lifts him above all the calamities that assail him, in spite of the hopeless ruin of his nation. The struggle is a sore one; his very life is bitter to him; and yet he emerges victorious. To know that God is with him is enough though all else fail him. Now as soon as the relation of God to a single soul has thus been set free from all earthly conditions the work of prophecy is really complete, for what God has done for one soul He can do for all, but only by speaking to

¹ We should be apt to say “the true idea of God,” but that is a way of putting it which does not correspond with prophetic thought. To the prophets knowledge of God is concrete knowledge of the divine character as shown in acts—knowledge of a person, not of an idea.

each believer as directly as He does to Jeremiah. Henceforth revelation is not a word to the nation spoken through an individual, but a word spoken to one which is equally valid for every one who receives it with like faith. The New Testament joins on not to the post-exile prophets, who are only faint echoes of earlier seers, but to Jeremiah's great idea of the new covenant in which God's law is written on the individual heart, and the community of faith is the fellowship of all to whom He has thus spoken. The prophets of the restoration are only the last waves beating on the shore after the storm which destroyed the old nation, but created in its room a fellowship of spiritual religion, had passed over; they resemble the old prophets in the same imperfect way in which the restored community of Jerusalem resembled a real nation. It was only in so far as the community of faith still possessed certain external features of nationality that post-exile prophecy was possible at all, and very soon the care of the national or quasi-national aspects of religion passed altogether out of their hands into those of the scribes, of whom Ezekiel was the first father, and whose Torah was not the living word of prophecy but the Pentateuchal code. From the time of Jeremiah downwards the perennial interest of Old Testament thought lies in the working out of the problems of personal religion and of the idea of a spiritual fellowship of faith transcending all national limitation; and these are the motives not only of the lyrics of the Psalter but of the greater theodiceas of Isa. xl.-lxvi. and of the book of Job. The theodicea of the prophets is national; they see Jehovah's righteousness working itself out with unmistakable clearness in the present, and know that all that He brings upon Israel is manifestly just; but from the days of Jeremiah¹ the fortunes of Israel as a nation are no longer the one thing which religion has to explain; the greater question arises of a theory of the divine purpose which shall justify the ways of God with individual men or with His "righteous servant"—that is, with the ideal community of true faith as distinct from the natural Israel. The discussion of these problems constitutes a quite distinct type of Old Testament literature beginning with the book of the Great Unknown, which is now appended to the writings of Isaiah; but this is an accident of arrangement that ought not to lead us to include among the prophetic writings proper a work so entirely different in origin and scope, and addressed not to an actual nation but to the ideal Israel, whose vocation is no longer political but purely religious.

It will be evident even from this rapid sketch, necessarily confined to a few of the most cardinal points, that Hebrew prophecy is not a thing that can be defined and reduced to a formula, but was a living institution which can only be understood by studying its growth and observing its connection with the historical movements with which its various manifestations were bound up. Throughout the great age of prophecy the most obvious formal character that distinguished it was that the prophet did not speak in his own name but in the name of Jehovah. But the claim to speak in the name of God is one which has often been made—and made sincerely—by others than the prophets of Israel, and which is susceptible of a great variety of meanings, according to the idea of God and His relation to man which is presupposed. Every early religion seeks to realize such an intercourse with the object of worship as shall be two-sided; when the worshipper approaches the deity he desires to have an answer assuring him of acceptance and divine aid. The revelation thus looked for may be found in natural omens, in the priestly lot or some similar sacral oracle, or, finally, in the words of a seer who is held to be in closer contact with the deity than common men. Broadly speaking these methods of revelation are found in all ancient religions, but no other religion

presents anything precisely analogous to prophecy. It is true that the prophets absorbed the old seers, and that the Israelites, as we see in the case of the asses of Kish, went to their seers on the same kind of occasions as sent heathen nations to seers or diviners. There is sufficient evidence that down to the last age of the Judæan monarchy practices not essentially different from divination were current in all classes of society, and were often in the hands of men who claimed to speak as prophets in the name of Jehovah. But the great prophets disallowed this claim, and the distinction which they draw between true prophecy and divination is recognized not only in the prophetic law of Deuteronomy but in earlier parts of the Pentateuch and historical books. "There is no augury in Jacob and no divination in Israel; in due time it is told to Jacob and to Israel what God doth work" (Num. xxiii. 23). The seer, in the sense in which all antiquity believed in seers, is simply a man who sees what others cannot see, no matter whether the thing seen be of public or of mere private interest; but the prophet is an organ of Jehovah's kingship over His people—he sees and tells so much of the secret purpose of Jehovah as is needful for His people to know. We have already seen how Amos and Hosea put this (*supra*, p. 839), and it does not appear that they were introducing a conception of prophecy formally novel—the new thing was their conception of Jehovah's purpose. And so too with the following great prophets; the important thing in their work was not their moral earnestness and not their specific predictions of future events, but the clearness of spiritual insight with which they read the spiritual significance of the signs of the time and interpreted the movements of history as proofs of Jehovah's actual moral sovereignty exercised over Israel. So long as the great problems of religion could be envisaged as problems of the relation of Jehovah to Israel as a nation the prophets continued to speak and to bring forth new truths; but the ultimate result was that it became apparent that the idea of moral government involved the destruction of Israel, and then the function of prophecy was gone because it was essentially national in its objects. But meantime the relation of God to the prophet had acquired an independent significance; the inner life of Isaiah during the long years when his teaching seemed lost, or of Jeremiah through the whole course of his seemingly fruitless ministry, was rich in experiences of faith triumphing over temptations and trials, of personal converse with God sustaining the soul in the face of difficulties hopeless to the eye of sense, which formed the pattern of a new and higher stage of religion in which the relation of the individual soul to God should be set free from those limitations which had been imposed by the conception that the primary subject of religion is the nation. But the religion of the Old Testament did not become merely individualistic in becoming individual, and now the problem was to realize a new conception of the society of faith, the true Israel, the collective servant of Jehovah—in a word to form the idea of a spiritual commonwealth and to show how it was possible for faith to hold fast, in spite of all seeming contradiction, to the truth that Jehovah had chosen for Himself a spiritual people, every member of which was in truth the object of His saving and unfailing love, and which should ultimately in very deed inherit that glory of which the carnal Israel was unworthy. This is the post-prophetic problem which occupies the more profound of the later Old Testament books, but first received its true solution in the gospel, when the last shreds of the old nationalism disappeared and the spiritual kingdom found its centre in the person of Christ.

Old Testament prophecy therefore forms only one stage in a larger development, and its true significance and value can only be realized when it is looked at in this light. In this as in all other matters of transcendental truth "wisdom is justified of her children";

¹ One might say from the days of Habakkuk.

the conclusive vindication of the prophets as true messengers of God is that their work forms an integral part in the progress of spiritual religion, and there are many things in their teaching the profundity and importance of which are much clearer to us than they could possibly have been to their contemporaries, because they are mere flashes of spiritual insight lighting up for a moment some corner of a region on which the steady sun of the gospel had not yet risen.

A less complete but yet most powerful vindication of the spiritual prophets was furnished by the course and event of Israel's history. After the captivity it was no longer a question that the prophetic conception of Jehovah was the only possible one. Thenceforth the religion of Jehovah and the religion of the prophets are synonymous; no other reading of Israel's past was possible, and in fact the whole history of the Hebrews in Canaan, as it was finally shaped in the exile, is written from this point of view, and has come down to us, along with the remains of actual prophetic books, under the collective title of "The Prophets."

To some extent this historical vindication of the prophetic insight went on during the activity of the prophets themselves. From the time of Amos downwards the prophets spoke mainly at great historical crises, when events were moving fast and a few years were often sufficient to show that they were right and their opponents wrong in their reading of the signs of times. And here the controversy did not turn on the exact fulfilment of detailed predictions; detailed prediction occupies a very secondary place in the writings of the prophets; or rather indeed what seem to be predictions in detail are usually only free poetical illustrations of historical principles which neither received nor demanded exact fulfilment. Isaiah, for example, in the time of Ahaz sketches the fatal results of Assyrian intervention, and pictures the sufferings of Judah when it should become the battlefield of the rival empires of the Tigris and the Nile, in a way that was by no means realized in detail; but this does not affect the fact that he alone in Judah had correctly appreciated the historical situation, and that he did so not because he was a better statesman than his opponents, but because he had a different conception of the religious significance of the crisis. All through the prophetic period it was plain that the true prophets differed from the mere professional prophets and statesmen in their view of the political duties and prospects of the nation because they had a different idea, or, as they themselves would have said, a truer knowledge, of God, and so the prophets and their successors—notably Isa. xl.-lxvi.—look on the event of Israel's history, not so much as proving that Isaiah or Jeremiah was a true prophet, but as proving that the Jehovah of the prophets is the true God, whose word cannot return to Him void, but must surely accomplish that which He pleaseth (Isa. lv. 11).

The prophets themselves required no historical verification of their word to assure them that it was indeed the word of God, nor do they for a moment admit that their contemporaries are entitled to treat its authority as unproved till such verification is offered. The word of God carries its own evidence with it in its searching force and fire: "Is not my word like a fire, saith Jehovah, and like a hammer that breaketh the rock in pieces?" (Jer. xxiii. 29). To the prophet himself it comes with imperious force; it constrains him to speak (Amos iii. 8), seizes him with a strong hand (Isa. viii. 11), burns like a fire within his bones till it finds utterance (Jer. xx. 9); and it is this force of moral conviction which ought also to commend it to the conscience of his hearers. The word is true because it is worthy of the true God. When Deut. xviii. 21, 22 seeks the legal criterion of true prophecy in the fulfilment of prediction, the writer is no doubt guided by the remembrance of the remarkable confirmation which the doctrines of spiritual prophecy had received in history then recent, but his criterion

would have appeared inadequate to the prophets themselves, and indeed this passage is one of the most striking proofs that to formulate the principles of prophetic religion in a legal code was an impossible task.

The mass of the nation, of course, was always much more struck by the "signs" and predictions of the prophets than by their spiritual ideas; we see how the idea of supernatural insight and power in everyday matters dominates the popular conception of Elijah and Elisha in the books of Kings. At a very early date the great prophets became a kind of saints or *welsh*, and the respect paid to the tombs of the prophets, which ultimately took in almost every particular the place of the old local shrines (Mat. xxiii. 29; Jerome, *Epit. Paulæ*, § 13; see OSADIAH), can be traced back to the time before the exile.¹

After the extinction of the prophetic voice, an ever-increasing weight was not unnaturally laid on the predictive element in their writings. Their creative religious ideas had become the common property of religious-minded Jews, at least in the somewhat imperfect shape in which they were embodied in the law, and their work on this side was carried on by the great religious poets. But the restored community which was still making a sort of faint attempt to be a religious nation as well as a church felt very painfully the want of a direct message from God in critical times such as the prophets of old had been wont to bring. And in this need men began to look at the prophetic books, mainly in the hope that there might be found in them predictions which still awaited fulfilment, and might be taken as referring to the latter days of Persian or Greek oppression. By ignoring the free poetical form of prophecy, and still more by ignoring the fact that the prophetic pictures of the ideal future of Israel could not be literally fulfilled after the fall of the ancient state had entirely changed the sphere in which the problems of true religion had to be worked out, it was possible to find a great mass of unfulfilled prophecy which might form the basis of eschatological constructions. To use this material for the purpose in hand it was necessary to symbolize what was literal, and to literalize what was figurative, to harmonize and to rearrange, above all to introduce some sort of prophetic chronology of future events. But all this was quite in the vein of later Judaism, and so at length the unfulfilled predictions of the prophets served as the raw material for the elaborate eschatology of the apocalypses. See APOCALYPTIC LITERATURE and MESSIAH. In spite of superficial resemblances, mainly due to the unavoidable influence of current exegetical methods, the New Testament conception of prophecy as fulfilled in Christ is fundamentally different from the Jewish apocalyptic view of unfulfilled prophecy. Not external details but the spiritual ideas of the prophets find their fulfilment in the new dispensation, and they do so under forms entirely diverse from those of the old national kingdom of Jehovah.

Literature.—In the ancient and mediæval church and in the dogmatic period of Protestantism there was little or no attempt at historical study of prophecy, and the prophetic books were found instructive only through the application of allegorical or typical exegesis. For details the reader may refer to Diestel, *Geschichte des Alten Testaments*, Jena, 1869, and for the final form of orthodox Protestant views to Witsius, *De Prophetis et Prophetia*. The growing sense of the insufficiency of this treatment towards the close of the period of dogmatism showed itself in various ways. On the one hand we have the revival of apocalyptic exegesis by Coceus and his school, which has continued to influence certain circles down to the present day, and has led to the most varied attempts to find in prophecy a history, written before the event, of all the chief vicissitudes of the Christian church down to the end of the world. On the other hand Lowth's *Lectures on Hebrew Poetry*, and the same author's *Commentary on Isaiah*, (1778), show the beginnings of a tendency to look mainly at the æsthetic aspects of the prophetic books, and to view the prophets as enlightened religious poets. This tendency culminates in Eichhorn, *Die Hebräischen Propheten*, 1816. Neither of these methods could do much for the historical understanding of the phenomena of prophecy as a whole, and the more liberal students of the Old Testament were long blinded by the moralizing unhistorical rationalism which succeeded the old orthodoxy. The first requisite of real progress, after dogmatic prejudices had been broken through, was to get a living conception of the history in which the prophets moved; and this again called for a revision of all traditional notions as to the age of the various parts of Hebrew literature—criticism of the sources of the history, among which the prophetic books themselves take the first place. In recent times therefore advance in the understanding of the pro-

¹ See 2 Kings xxiii. 21, and also Deut. xxxiv. 6. So too all the old national heroes and heroines ultimately became prophets; in the case of Deborah there is even a fusion in local tradition between an old heroine and an historical seer.

phets has moved on *pari passu* with the higher criticism, especially the criticism of the Pentateuch, and with the general study of Hebrew history; and most works on the subject prior to Ewald must be regarded as quite antiquated except for the light they cast on detailed points of exegesis. On the prophets and their works in general the best book is still Ewald's *Propheten des Alten Bundes* (1st ed. 1840-41, 2d ed. 1867-68, Eng. tr. 1876-77). The subject is treated in all works on Old Testament introduction (among which Kuenen's *Onderzoek*, vol. ii., claims the first place), and on Old Testament theology (see especially Vatke, *Religion des A. T.*, 1835). On the theology of the prophets there is a separate work by Duhm, Bonn, 1875, and Knobel's *Prophetismus der Hebräer*, 1837, is a separate introduction to the prophetic books. Kuenen's *Prophets and Prophecy in Israel* (1875, Eng. tr. 1877) is in form mainly a criticism of the traditional view of prophecy, and should therefore be compared with his *Onderzoek en Godsdienst van Israel*. Most English books on the subject are more theological than historical, but a sketch of Hebrew prophecy in connection with the history down to the close of the 8th century is given by W. R. Smith, *The Prophets of Israel*, Edinburgh, 1882. A useful commentary on the prophetic books in general forms two volumes of Reuss, *La Bible* (Paris, 1876); the special literature is referred to in the articles on the several prophets. The literature of the theological questions connected with prophecy is much too copious to be cited here; lists will be found in several of the books already referred to. (W. R. S.)

2. *Prophets in the Christian Church.*—The appearance of prophets in the first Christian communities is one proof of the strength of faith and hope by which these bodies were animated. An old prophecy (Joel ii. 28) had foretold that in the Messianic age the spirit of God would be poured out on every member of the religious community, and in point of fact it was the universal conviction of those who believed in Christ that they all possessed the Spirit of God. This Spirit, manifesting His presence in a variety of ways and through a variety of gifts, was to be the only ruling authority in the church. He raised up for Himself particular individuals, into whose mouths He put the word of God, and these were at first regarded as the true leaders of the congregations. We find accordingly that there were prophets in the oldest church, that of Jerusalem (Acts xi. 27; xv. 32), and again that there were "prophets and teachers" in the church at Antioch (Acts xiii. 1). These were not office-bearers chosen by the congregation, but preachers raised up by the Spirit and conferred as gifts on the church. When Paul says (1 Cor. xii. 28; cf. Eph. iv. 11), "God has set some in the church, first as apostles, second as prophets, third as teachers," he points to a state of things which in his time prevailed in all the churches both of Jewish and heathen origin. We here learn from Paul that the prophets occupied the second position in point of dignity; and we see from another passage (1 Cor. xiv.) that they were distinguished from the teachers by their speaking under the influence of inspiration—not, however, like the "speakers in tongues," in unintelligible ejaculations and disconnected words, but in articulate, rational, edifying speech. Until recently it was impossible to form any distinct idea of the Christian prophets in the post-apostolic age, not so much from want of materials as because what evidence existed was not sufficiently clear and connected. It was understood, indeed, that they had maintained their place in the churches till the end of the 2d century, and that the great conflict with what is known as Montanism had first proved fatal to them; but a clear conception of their position and influence in the churches was not to be had. But the discovery, by Bryennios, of the ancient Christian work called *Διδαχὴ τῶν δώδεκα ἀποστόλων* has immensely extended the range of our knowledge, and has at the same time thrown a clear light on many notices in other sources which for want of proper interpretation had been previously neglected or incorrectly understood.

The most important facts known at present about the manner of life, the influence and the history of the early Christian prophets are the following. (1) Down to the close of the 2d century the prophets (or prophetesses) were regarded as an essential element in a church possessing the Holy Ghost. Their existence was believed in, and they did actually exist, not only in the catholic congregations—if the expression may be used—but also in the Marcionite Church and the

Gnostic societies. Not a few Christian prophets are known to us by name; as Agabus, Judas and Silas in Jerusalem; Barnabas, Simon Niger, etc., in Antioch; in Asia Minor, the daughters of Philip, Quadratus, Ammia, Polycarp, Melito, Montanus, Maximilla and Priscilla; in Rome, Hermas; among the followers of Basilides, Barkabbas and Barkoph; in the community of Apelles, Philumene, etc. Lucian tells us that the impostor Peregrinus Proteus, in the time of Antoninus Pius, figured as a prophet in the Christian churches of Syria. (2) Till the middle of the 2d century the prophets were the regular preachers of the churches, without being attached to any particular congregation. While the "apostles" (i.e., itinerating missionaries) were obliged to preach from place to place, the prophets were at liberty either, like the teachers, to settle in a certain church or to travel from one to another. (3) In the time of Paul the form of prophecy was reasoned exhortation in a state of inspiration; but very frequently the inspiration took the form of ecstasy—the prophet lost control of himself, so that he did not remember afterwards what he had said. In the Gentile-Christian churches, under the influence of pagan associations, ecstasy was the rule. (4) With regard to the matter of prophecy, it might embrace anything that was necessary or for the edification of the church. The prophets not only consoled and exhorted by the recital of what God had done and predictions of the future, but they uttered extempore thanksgivings in the congregational assemblies, and delivered special directions, which might extend to the most minute details, as, for example, the disposal of the church funds. (5) It was the duty of the prophets to follow in all respects the example of the Lord (*ἔχειν τοὺς τρόπους τοῦ Κυρίου*), and to put in practice what they preached. But an ascetic life was expected of them only when, like the apostles, they went about as missionaries, in which case the rules in Mat. x. applied to them. Whenever, on the contrary, they settled in a place they had a claim to a liberal maintenance at the hands of the congregation. The author of the *Διδαχὴ* even compares them to the high priests of the Old Testament, and considers them entitled to the first-fruits of the Levitical law. In reality, they might justly be compared to the priests in so far as they were the mouthpieces of the congregation in public thanksgiving. (6) Since prophets were regarded as a gift of God and as moved by the Holy Spirit, the individual congregation had no right of control over them. When anyone was approved as a prophet and exhibited the "conversation of the Lord," no one was permitted to put him to the test or to criticise him. The author of the *Διδαχὴ* goes so far as to assert that whoever does this is guilty of the sin against the Holy Ghost. (7) This unique position of the prophets could only be maintained so long as the original enthusiasm remained fresh and vigorous. From three quarters primitive Christian prophecy was exposed to danger—first, from the permanent officials of the congregation, who, in the interests of order, peace, and security could not but look with suspicion on the activity of excited prophets; second, from the prophets themselves, in so far as an increasing number of dishonest characters was found amongst them, whose object was to levy contributions on the churches; third, from those prophets who were filled with the stern spirit of primitive Christianity and imposed on churches, now becoming assimilated to the world, obligations which these were neither able nor willing to fulfil. It is from this point of view that we must seek to understand the so-called montanistic crisis. Even the author of the *Διδαχὴ* finds it necessary to defend the prophets who practiced celibacy and strict asceticism against the depreciatory criticism of church members. In Asia Minor there

¹ See Lucian's story about Peregrinus, and that chapter of the *Διδαχὴ* where the author labors to establish criteria for distinguishing false prophets from true.

was already in the year 160 a party, called by Epiphanius "Alogi," who rejected all Christian prophecy. On the other hand, it was also in Asia Minor that there appeared along with Montanus those energetic prophetesses who charged the churches and their bishops and deacons with becoming secularized, and endeavored to prevent Christianity from being naturalized in the world, and to bring the churches once more under the exclusive guidance of the Spirit and His charismata. The critical situation thus arising spread in the course of a few decades over most of the provincial churches. The necessity of resisting the inexorable demands of the prophets led to the introduction of new rules for distinguishing true and false prophets. No prophet, it was declared, could speak in ecstasy,—that was devilish; further, only false prophets accepted gifts. Both canons were innovations, designed to strike a fatal blow at prophecy and the church organization re-established by the prophets in Asia,—the bishops not being quite prepared to declare boldly that the church had no further need of prophets. But the prophets would not have been suppressed by their new methods of judging them alone. A much more important circumstance was the rise of a new theory, according to which all divine revelations were summed up in the apostles or in their writings. It was now taught that prophecy in general was a peculiarity of the Old Testament ("lex et prophetæ usque ad Johannem"); that in the new covenant God had spoken only through apostles; that the whole word of God so far as binding on the church was contained in the apostolic record—the New Testament;¹ and that, consequently, the church neither required nor could acknowledge new revelations, or even instructions, through prophets. The revolution which this theory gradually brought about is shown in the transformation of the religious, enthusiastic organization of the church into a legal and political constitution. A great many things had to be sacrificed to this, and amongst others the old prophets. The strictly enforced episcopal constitution, the creation of a clerical order, and the formation of the New Testament canon accomplished the overthrow of the prophets. Instead of the old formula, "God continually confers on the church apostles, prophets, and teachers," the word now was—"The church is founded in the (written) word of the prophets (i. e., the Old Testament prophets) and the apostles (viz., the twelve and Paul)." After the beginning of the 3d century there were still no doubt men under the control of the hierarchy who experienced the prophetic ecstasy, or clerics like Cyprian who professed to have received special directions from God; but prophets by vocation no longer existed, and these sporadic utterances were in no sense placed on a level with the contents of the sacred Scriptures.

See Bückmann, "Ueber die Wunderkräfte bei den ersten Christen und ihr Erlöschen," in the *Ztschr. f. d. ges. luther. Theol. u. Kirche*, 1878, p. 216-255 (learned but utterly uncritical); Bonwetsch, "Die Prophetie im apostol. und nach-apostol. Zeitalter," in the *Ztschr. f. kirchl. Wissensch. u. kirchl. Leben*, 1884, part 8, p. 408 sq., part 9, p. 460 sq.; Harnack, *Die Lehre der zwölf Apostel*, 1884, p. 93-137. (A. HA.)

PROSELYTE (προσέλυτος) is the term most frequently adopted by the Septuagint, especially in legal passages, to represent the Hebrew גֵר. The גֵר, or more fully גֵר ו'תֹשָבָה, is not any "stranger" but a stranger dwelling in a Hebrew community and enjoying a certain measure of protection. In old time at least the position of such a stranger was no doubt very insecure, for he had no strong kinsmen to take his part, and so, like the widow and orphan, with whom many passages of the Old Testament associate him, he was liable to oppression. The law as well as the prophets commend him to the humane regard of his

neighbors, but it would have been quite foreign to antique ideas to grant him equal rights (see Lev. xxv. 45; Deut. xxiii. 20). Like the Arabic *jār*, therefore (whose name is at bottom the same), he must have generally sought to attach himself as a client to some individual or community able to protect him, and so we must understand the metaphor in passages like Ps. xv. 1, xxxix. 12.

In the old Hebrew kingdom the word *gēr* had a civil not a religious significance, and it would almost seem that a poor Israelite without inheritance might sink to this position, which indeed is scarcely distinguishable from that of the Levite in Jud. xvii. 8, who went forth to sojourn (*gār*) where he might find a place. The exile and the restoration made a change in this as in all other aspects of Hebrew society. On the one hand Ezekiel xlvii. 22 and Isa. xiv. 1 contemplate that the restored nation shall be recruited by strangers who are received on equal terms; but, as the Jews returned not as an independent nation but as a distinct religious community, this implies especially that the sons of the stranger, by joining Israel, observing the Sabbath, and holding fast to Jehovah's covenant, may gain admission to all the privileges of the temple and its worship. So it is put in Isa. lvi. 6, 7 in marked contrast to the restrictions laid down in Deut. xxiii. 3, 7 sq. That the views of the prophets had practical issue cannot be doubted; even the foreign Nethinim in the second temple were rapidly transformed not merely into good Israelites but into Levites. The condition of admission to the full privileges of an Israelite, in particular to the passover, is, according to the Priestly Code (Exod. xii. 48; Numb. ix. 14), circumcision,—to which the later Jewish usage adds lustration by immersion in water (baptism, *t'bilā*) and the presentation of a sacrifice (*korbān*). The immersion, about which there has been a good deal of controversy, some maintaining that it came into use later than Christian baptism, was really a necessary act for one who had been previously unclean, and may be held to be involved in the general Pentateuchal law of ceremonial washings. The later technical name for a heathen who thus joined the theocracy was גֵר הַצֶּדֶק, "proselyte of righteousness."

The free admission of foreigners to the Jewish church is a mark of the universalistic tendency which, in spite of all the narrownesses of Judaism under the law, accompanied the break-up of the old national system. On the other hand the so-called Law of Holiness (later than Ezekiel but earlier than the Priestly Code), which is contained in Lev. xvii. sq., presents a different line of transition from the purely civil to the religious meaning of *gēr*. In these laws, which proceed throughout on the principle that Israel, and all that has to do with Israel, must be regulated by regard to formal holiness, it is demanded that certain rules shall be enforced not only on Israelites proper but on strangers sojourning in their land. They are not to eat blood (xvii. 10), commit incest (xviii. 26), sacrifice to Moloch (xx. 2), or blaspheme Jehovah (xxiv. 16); and for murder and other crimes they are to be answerable to the Hebrew authorities according to Hebrew law (xxiv. 22). These rules are in substance—the third being extended to a prohibition of idolatry generally—the "Noachic laws" to which in later usage a man or woman might promise to conform and thereby, without becoming a regular member of the theocracy, be recognized as a "proselyte of the gate," i. e., "within the gates of Israel." What the Law of Holiness proposed to enforce became in fact—the theocracy not possessing political power over strangers—a voluntary obligation assumed by those "who worshipped God" (σεβόμενοι τὸν θεόν, Acts xiii. 50, xvi. 14, xvii. 4, 17, xviii. 7—in E. V. often rendered "devout").

The proselytizing zeal of the Jews is spoken of in Mat. xxiii. 15, and by many Greek and Latin writers. Up to the time of Hadrian it was facilitated by the favor generally extended to the Jews by the Roman

¹ The Apocalypse of John was received into it, not as the work of a prophet, but as that of an apostle.

emperors; and not only on Semitic soil, as at Damascus, where Josephus tells us that most of the women were proselytes, but throughout the Roman world many converts were made, especially among women. The most noted conversion was that of the royal house of Adiabene (Josephus, *Ant.*, xx. 2), of which the splendid tomb of Queen Helena, a little way outside of Jerusalem, still remains a monument.

PROSERPINE (*Proserpina*) is the Latin form of PERSEPHONE,¹ a Greek goddess, daughter of Zeus and the earth-goddess Demeter. In Greek mythology Demeter and Proserpine were closely associated, being known together as the two goddesses, the venerable or august goddesses, sometimes as the great goddesses. Proserpine herself was commonly known as the daughter (Core), sometimes as the first-born. As she was gathering flowers with her playmates in a meadow, the earth opened, and Pluto, god of the dead, appeared and carried her off to be his queen in the world below. This legend was localized in various places, as at Eleusis, Lerna, and "that fair field of Euna" in Sicily. Torch in hand, her sorrowing mother sought her through the wide world, and finding her not she forbade the earth to put forth its increase. So all that year not a blade of corn grew on the earth, and men would have died of hunger if Zeus had not persuaded Pluto to let Proserpine go. But before he let her go Pluto made her eat the seed of a pomegranate, and thus she could not stay away from him forever.² So it was arranged that she should spend two-thirds (according to later authors, one-half) of every year with her mother and the heavenly gods, and should pass the rest of the year with Pluto beneath the earth. There can be little doubt that this is a mythological expression for the growth of vegetation in spring and its disappearance in Autumn. According to Theopompus there was a Western people who actually called the spring Proserpine. As wife of Pluto, she sent spectres, ruled the ghosts, and carried into effect the curses of men. The lake of Avernus, as an entrance to the infernal regions, was sacred to her. From the head of a dying person Proserpine was supposed to cut a lock of hair which had been kept sacred and unshorn through life.³ She was sometimes identified with Hecate. On the other hand in her character of goddess of the spring she was honored with flower festivals in Sicily and at Hipponium in Italy. Sicily was a favorite haunt of the two goddesses, and ancient tradition affirmed that the whole island was sacred to them. The Sicilians claimed to be the first on whom Demeter had bestowed the gift of corn

and hence they honored the two goddesses with many festivals. They celebrated the festival of Demeter when the corn began to shoot, and the descent of Proserpine when it was ripe. At Cyane, a fountain near Syracuse which Pluto made to spring up when he carried off his bride, the Syracusians held an annual festival in the course of which bulls were sacrificed by being drowned in the water. At Cyzicus also, in Asia Minor, bulls were sacrificed to Proserpine. Demeter and Proserpine were worshipped together by the Athenians at the greater and less Eleusinian festivals, held in Autumn and spring respectively. In the Eleusinian mysteries Proserpine no doubt played an important part (see ELEUSINIA and MYSTERIES). One Greek writer, Achemachus, identified Proserpine with the Egyptian Isis. At Rome Proserpine was associated with Ceres (the Roman representative of Demeter) in the festival of the Cerealia (April 12 to 19), she was represented as the wife of Dis Pater (the Roman Pluto), and was sometimes identified with the native Latin goddess Libera. The pomegranate was Proserpine's symbol, and the pigeon and cock were sacred to her. Her votaries abstained from the flesh of domestic fowls, fish, beans, pomegranates, and apples. In works of art she appears with a cornucopia or with ears of corn and a cock. The regular form of her name in Greek was Persephone, but various other forms occur, Phersphone, Persephassa, Pheisephassa, Pherrephatta, etc., to explain which different etymologies were invented. Corresponding to Proserpine as goddess of the dead is the old Norse goddess *Hel* (Gothic *Halja*), whom Saxo Grammaticus calls Proserpine. (J. G. FR.)

PROSKUROFF, a district town of the government of Podolia, Russia, situated on the railway from Odessa to Lemberg, 62 miles to the northwest of Schmerinka junction, and on the highway from Zhitomir to Kieff. It is poorly built, mostly of wood, on a low marshy plain surrounded by hills, at the junction of the Ploskaya with the Bug. Its old castle has been destroyed, the site being occupied by a Catholic church. The Orthodox cathedral (1839) contains a very ancient and highly venerated icon of the Virgin. The manufactures are insignificant but the Jewish merchants carry on an active export trade in corn and sugar, while the imports consist of salt and various manufactured wares. Agriculture and market-gardening are the chief occupations of its Little-Russian inhabitants. Of the population (11,750 in 1880) more than one-half are Jews.

PROSPER OF AQUITAINE (AQUITANUS, OR AQUITANICUS), a Christian prose and verse writer of the first half of the 5th century. Of his personal history almost nothing is known; his surname seems to imply that he was a native of Aquitania, and there are various indications that he was educated as a "rhetorician." While still comparatively young he gave himself to a religious and ascetic life, and at Marseilles soon made himself prominent as a champion of orthodoxy in the controversy with the Massilians or Semi-Pelagians. In this connection he opened a correspondence with Augustine, along with his friend Hilarius (c. 429 A. D.), and about the same time (c. 430) he composed an hexameter poem of upwards of one thousand lines, *Adversus Ingratos*, a glowing polemic against the Pelagians. After Augustine's death he wrote *Pro Augustino Responsiones*, and about 431 he visited Rome, still in the interest of Augustinianism, eliciting from Pope Celestine his *Epistola ad Episcopos Gallorum* against Cassianus. There are some indications that the latter years of his life were spent in Rome, and that he wrote his *Chronicon* there. The year of his death is unknown; the chronicle is brought down to 455.

Prosper's enthusiastic admiration for Augustine (to whom however, he was not personally known) led him to make an abridgment of that author's commentary on the Psalms, as well as a collection of sentences for his works,—probably the first dogmatic compilation of the class in which the

¹ Some, however, regard *Proserpina* as a native Latin form, not borrowed from the Greek.

² The idea that persons who have made their way to the abode of the dead can return to the upper world if they have not tasted the food of the dead appears elsewhere, as in New Zealand (R. Taylor, *New Zealand*, pp. 283, 271).

³ *Æn.*, iv. 638 sq. It appears to have been a Greek custom to cut a lock of hair from a dead man's head, and hang it outside of the house door, in token that there was a corpse in the house. At least this seems a fair inference from Eurip., *Alc.*, 75, 76, 101-4. The lock so cut may have been that which was kept sacred to the gods and unshorn (*ἔθνη, μαρ., s. v., ἀσκελευμένους*). For examples of hair dedicated to gods, see *Il.*, xxiii. 141 sq.; *Plut.*, *Thes.*, 5; Paus., viii. 20, 3. In Tibet a lama (priest) is called in to cut off some hairs from the head of a dying person, in order that his soul may escape through the top of his head, which is deemed an essential condition of a good transmigration (Horace de la Penna, in Bogle and Manning's *Travels in Tibet*). We can hardly doubt that the intention of the Græco-Roman custom was similar. In modern Greece the god of death, Charos, is supposed to draw the soul out of the body, and if a man resists the Arachobites believe that Charos slits open his breast (B. Schmidt, *Volksleben der Neugriechen*, p. 228). There are other instances of incisions made in the body of a dying person to allow his soul to escape (cp. Bastian, *Mensch*, ii. 342). The custom probably dates from the times when death in battle was the usual death. In the legend of Nisus and Scylla there is a trace of the custom which was still observed in classical times in the sacrifice of animals. The practice of cutting off the hair of the dead prevailed in India, though it does not appear in the Vedas (Monier Williams, *Religious Thought and Life in India*, p. 281). We are reminded of the practice of the Pawnees and other North American Indians, who shaved the head with the exception of one lock (the scalp lock), which was removed by a victorious enemy (Catlin, *North American Indians*, vol. ii. p. 24). The Sandwich Islanders also cut a lock from a slain foe (Ellis, *Pol. Res.*, vol. iv. p. 159).

Liber Sententiarum is the best known example. Some of Augustine's theological dicta he also put into elegiac metre (one hundred and six epigrams). Prosper's *Chronicon* is of value from the year 29 A.D. onwards, some of the sources which he used for that period being no longer extant. The best edition of the *Opera* is the Benedictine by Le Brun and Mangeant (Paris, 1711), reprinted in Migne's collection.

PROSSNITZ (Slavonic, *Prostejov*), the chief place in the fertile district of the Hanna, in Moravia, Austria, is situated on the small river Rumza, 11 miles south-west of Olmütz. It carries on manufactures of sugar, cotton, and linen, and is an important centre for the sale of the barley and other produce of the Hanna. It is a town of ancient origin, and in the 16th century was one of the chief seats of the Moravian Brethren. Population in 1880, 16,751.

PROTAGORAS of Abdera, the first of the so-called Sophists,—who, about the middle of the 5th century B.C., asserted throughout Greece the claims of education or culture in opposition on the one hand to technical instruction and on the other to physical research,—was an older contemporary of Socrates.¹ At the age of seventy, having been accused and convicted of atheism, Protagoras fled from Athens, and on his way to Sicily was lost at sea. His birth has been plausibly assigned to 481 and his death to 411 B.C. Forty years of his life were spent in the exercise of his popular and lucrative profession in the principal cities of Greece and Sicily. According to Plato (*Prot.*, 318 E), he endeavored to communicate to his pupils "good counsel or prudence (*εὐβουλία*), which should fit them to manage their households, and to take part by word and deed in civic affairs." In short, he professed not to "instruct" but to "educate." Further, the education which he provided was of a literary sort,—oratory, grammar, style, and the interpretation of the poets being among the subjects which he used as instruments. His formal lectures were supplemented by discussions amongst his pupils. He left behind him several treatises, of which only two or three sentences have survived. In *Truth*, by way of justifying his rejection of philosophy or science, he maintained that "man is the measure of all things—of what is, that it is, and of what is not, that it is not."¹ Besides *Truth*, and the book *Of the Gods* which caused his condemnation at Athens, Diogenes Laertius attributes to him treatises on political, ethical, educational, and rhetorical subjects.

On the significance of the Sophistical movement, and the part which Protagoras took in promoting it, as well as for bibliographical information, see SOPHISTS.

PROTECTION. See FREE TRADE and POLITICAL ECONOMY.

PROTESTANTENVEREIN is the name of a society in Germany the general object of which is to promote the union and the progress of the various established Protestant churches of the country in harmony with the advance of culture and on the basis of Christianity. It was founded at Frankfurt-on-the-Main in 1863 by a number of distinguished clergymen and laymen of liberal tendencies, representing the freer parties of the Lutheran and Reformed churches of the various German states, amongst whom were the statesmen Bluntschli and Von Bennigsen and the professors Rothe, Ewald, Schenkel, Hilgenfeld, and Hitzig. The more special objects of the association are the following: the development of the churches on the basis of a representative parochial and synodal system of government in which the laity shall enjoy their full rights; the promotion of a federation of all the churches in one national church; resistance to all hierarchical tendencies both within and without the Protestant churches; the promotion of Christian toleration and mutual respect amongst the various confessions; the rousing and nurture of the Christian life and of all Christian works necessary for the moral strength and prosperity

of the nation. These objects include opposition to the claims of Rome and to autocratic interference with the church on the part of either political or ecclesiastical authorities, efforts to induce the laity to claim and exercise their privileges as members of the church, the assertion of the right of the clergy, laity, and both lay and clerical professors to search for and proclaim freely the truth in independence of the creeds and the letter of Scripture. When the association was first formed the necessity for it was felt to be great. The separation between the Calvinistic and the Lutheran churches on the one hand, and between the churches of the various states on the other, even when the former separation had been bridged over by the Prussian Union; the entire absence of any satisfactory system of church government, the autocratic authority of either the monarch or his ministers, or of the clergy, being supreme; the increasing encroachments of the papal power upon the rights of the individual and the state; the growing estrangement of the educated classes from the church on the one hand, with the manifestation of either ignorance of the fact or a determination to meet it with bitter denunciation on the part of the orthodox clergy on the other, were regarded as urgent calls to action by the liberals. Membership in the association is open to all Germans who are Protestants and declare their willingness to co-operate in promoting its objects. To facilitate its operations, the general association is broken up into a few groups or societies confined to certain geographical areas. Every second year (at first every year) general meetings of the entire association are held at some convenient place. At first the governing committee had its permanent seat at Heidelberg, but in 1874 Berlin, as the new capital of the empire, was chosen. The means used to promote the objects aimed at are mainly (1) the formation of local branch associations throughout the country, the duty of which is by lectures, meetings, and the distribution of suitable literature to make known and advocate its principles, and (2) the holding of great annual or biennial meetings of the whole association, at which its objects and principles are expounded and applied to the circumstances of the church at the moment. The "theses" accepted by the general meetings of the association as the result of the discussions on the papers read indicate the theological position of its members. The following may serve as illustrations:

The creeds of the Protestant church shut the doors on the past only, but open them for advance in the future; it is immoral and contrary to true Protestantism to require subscription to them. The limits of the freedom of teaching are not prescribed by the letter of Scripture, but a fundamental requirement of Protestantism is free inquiry in and about the Scriptures. The attempt to limit the freedom of theological inquiry and teaching in the universities is a violation of the vital principle of Protestantism. Only such conceptions of the person of Jesus can satisfy the religious necessities of this age as fully recognize the idea of his humanity and place in history. The higher reason only has unconditional authority, and the Bible must justify itself before its tribunal; we find the history of divine revelation and its fulfilment in the Bible alone, and reason bids us regard the Bible as the only authority and canon in matters of religious belief.

The formation of the association at once provoked fierce and determined opposition on the part of the orthodox sections of the church, particularly in Berlin. Attempts more or less successful have been made from the first to exclude clergymen and professors identified with it from the pulpits and chairs of Berlin and elsewhere, though membership in it involves no legal disqualification for either. One of the objects of the association was to some extent obtained by the reorganization of the Prussian Church when Dr. Falk was cultus minister, on the basis of parochial and synodal representation, which came into full operation in 1879. But the election for the general synod turned out very unfavorable to the liberal party, and the large orthodox

¹ The exposition of this maxim contained in Plato's *Theætetus*, 152 C sq., is plainly not to be ascribed to Protagoras.

majority endeavored to use their power against the principles and the members of the association. The members of the association elected to the general synod were nine only, while the party of the decidedly orthodox numbered upwards of seventy. In 1882 the position of the association was rendered still more difficult by the agitation in Berlin of Dr. Kalthoff and other members of it in favor of a "people's church" on purely dissenting and extremely advanced theological principles. The turn of the political tide in the direction of conservatism in Berlin indicated by the retirement of the cultus minister Dr. Falk increased the difficulties and the work of the association, far as Dr. Falk was from sanctioning its theological principles. Moreover, it had sustained severe losses in its membership by death and other causes.

At the end of the twelfth year of its existence (1877) the association had 7500 members, its annual income was nearly £350 [\$1701], and it had distributed in the same year 10,000 copies of its publications. In 1880 the number of members had risen to 26,000, and of local associations to 80.

See Schenkel, *Der Deutsche Protestantenverein und seine Bedeutung für die Gegenwart* (Wiesbaden, 1868, 2d ed. 1871); *Der Deutsche*

Protestantenverein in seinen Statuten und den Thesen seiner Hauptversammlungen, 1865-82 (Berlin, 1883), and the annual reports in the *Allgemeine Kirchliche Chronik*, 1863-82, and *Theological Review*, July, 1869, pp. 289-96.

PROTESTANTS is the generic term for members of the churches which owe their origin directly or indirectly to the REFORMATION (*q. v.*). The name is derived from the Protest of Spire in 1529 (see LUTHER, vol. xv. p. 82). Certain small communities of Christians older than the Reformation, but agreeing with it in rejecting the authority of Rome, are generally and quite logically grouped as Protestants; and popularly the name is considered to include all Christians who do not belong to the Greek and Roman Catholic communions, though members of the Anglican Church, for example, frequently protest against such a classification as historically false and personally obnoxious. Protestantism has flourished best among the Teutonic peoples of Northern Europe, and has always found it difficult to make its way among the Latin peoples of the South.

The following table shows approximately the number of Protestants in the world:

I. EUROPE:

Great Britain and Ireland (Anglicans, 18,800,000; Presbyterians, 3,900,000; Methodists, 3,500,000; Independents, 1,200,000; Baptists, 1,000,000)	28,400,000 (estimate)
German Empire (Lutherans, Reformed, and United, 28,318,280; Mennonites, and other Baptists, 38,744)	28,357,024 (1880)
Norway and Sweden (Norway, 1,805,076; Sweden, 4,561,759, mostly Lutheran)	6,366,835 (1875 and 1880)
Denmark and Iceland (Denmark, 1,960,844; Iceland, 72,000, mostly Lutheran)	2,032,844 (1880)
Holland (Reformed, 2,346,568—including Remonstrants 9678; Lutherans, 73,696; Mennonites, 50,705)	2,472,680 (1879)
Switzerland (mainly Reformed)	1,667,109 (1880)
(Making a total in countries of the Teutonic race of 69,296,492.)	
France (Reformed or Calvinists, 467,531; Lutherans, 80,117; others, 33,109)	580,757 (1872)
Belgium, Spain and Portugal, Luxemburg, and Monaco (respectively 15,000, 10,500, 963, and 626	27,089 (various)
Italy (Waldensians, Free Church of Italy, Methodists, Baptists, etc.)	62,000 (estimate)
Roumania	13,800 (estimate)
(Total in countries of the Latin race, 683,646.)	
Austria (Lutherans, 289,005; Reformed, 110,525; Unitarians, 169, etc.)	401,479 (1880)
Hungary (Lutherans, 1,130,150; Reformed, 2,043,280; Unitarians, 56,190)	3,229,620 (1880)
Russia in Europe (Lutherans in Finland, 2,019,727	4,504,000 (partly estimate)
Turkey, Greece, Servia (respectively 10,200, 20,000, and 500)	30,700 (estimate)
Total in countries of Slavonic, non-Aryan, and mixed race, 8,165,799.)	78,145,937

II. AMERICA—

United States (Methodists, 3,686,114 church members; Baptists, 2,424,878; Lutherans, 950,868; Disciples of Christ, 591,821; Congregationalists, 381,697; Episcopalians, 347,781)	30,000,000 ¹
Canada	2,422,285 (1881)
West Indies	160,500 (estimate)
Central and South America	180,000 (partly estimate)
	32,762,785

III. ASIA AND AUSTRALASIA—

India (Anglicans, etc., 373,848; Baptists, Presbyterians, etc., 128,794; Lutherans, 29,577)	532,219 (1881)
Dutch Possessions	170,000 (partly estimate)
China and Corea (73,000), Japan (13,000), and Siam (2000)	88,000 (estimate)
Turkey in Asia (100,000) and Persia (5000)	105,000 (estimate)
New South Wales (516,512), Victoria (618,392), Queensland (139,380)	1,274,284 (1881)
South Australia (216,626) and West Australia (20,613)	237,239 (1881)
New Zealand	393,971 (1881)
Polynesia, Micronesia, and Melanesia (260,000, 8000, and 16,000)	284,000 (estimate)
	3,084,713

IV. AFRICA—

Egypt and North Africa (10,000) and West Africa (110,000)	120,000 (estimate)
Cape Colony, etc.	400,000 (estimate)
East and Central Africa (2000) and Madagascar (300,000)	302,000 (estimate)
	822,000

Total number of Protestants thus ascertained..... 114,815,435

This total of 115,000,000 is for obvious reasons considerably within the truth. Making allowance for increase of population since some of the census returns, it will probably be not beyond the mark to state the Protestants of Europe at 81,000,000, of America at 34,000,000, of Asia and Australasia at 3,300,000, and of Africa at 850,000, and the total in round numbers at 120,000,000. As regards Europe, compare Brachelli, *Die Staaten Europa's*, 1884. Juraschek, in his edition of Otto Hübner's *Geograph.-statistische Tabellen*, 1884, gives 123,000,000 Protestants, or 8.5 per cent. of the total population of the world, which he states at 1,435,000,000.

¹ This estimate of the Protestant population is based on the details of church membership (partly given above) obtained at the census of 1880.

PROTEUS, a Greek sea-god, spoken of by Homer as the Old Man of the Sea. In the *Odyssey* he dwells in the sea near Pharos, an island said to be a day's sail from the mouth of the Nile; in Virgil his home is the Carpathian Sea between Crete and Rhodes. He knew all things past, present and future, but was very loth to tell what he knew. Those who would consult him had first to surprise and bind him during his noon-day slumber in a cave by the sea, where he was wont to pass the heat of the day surrounded by his seals. Even when caught he would try to escape by assuming all sorts of shapes; now he was a lion, now a serpent, a leopard, a boar, a tree, fire, water. But if his captor held him fast, the god at last returned to his proper shape, gave the wished-for answer and then plunged into the sea. He was subject to Poseidon, whose finny droves he shepherded under the billows. In post-Homeric times some thought that Proteus was a king of Egypt, at whose court the fair Helen tarried after she had been carried off by Paris, while the Greeks fondly deemed she was in Troy. This is the story followed, with variations, by Herodotus, who got it from Egyptian priests, and by Euripides in his play of *Helen*.

The fairy tale of Proteus has been interpreted in various fanciful ways. Proteus's leading features—his knowledge of the future and his power of assuming any shape at pleasure—are characteristic of the "medicine-men" of savages in many parts of the world. As late as the beginning of our era there was a class of wizards at Rhodes who possessed two at least of the chief marks of "medicine-men"—the powers of transforming themselves and of making rain (*Diod. Sic.*, v. 55). There were rain-makers also at Rome (*Festus*, s.v. "aquælicium," where see commentary).

PROTEUS ANGUINUS, a blind, newt-like perenni-branchiate Amphibian, about a foot long, found in the Adelsberg, Maddalena and other limestone caverns of Carinthia and Carniola. The creature is white or flesh-colored and the transparent gills appear blood red; the skin passes uninterruptedly over the rudimentary eyes. The animal's body is cylindrical; the snout is long and blunt; the fore-feet have three toes and the hind (which are set very far back) two. There are three gill-arches and two gill-slits on each side. The absence of the fourth branchial arch is a feature that *Proteus* has in common with *Menobranchus* and also with *Spelerpes*. The skull is of an elongated form and presents several remarkable characters. The trabeculæ cranii are persistent, as in the snake. The membrane bones are singularly few, the maxillæ being rudimentary and the nasals and supra-occipital absent. In the lower jaw the splenial is said to be absent, but a mento-Meckelian cartilage element is present, as in *Batrachia*. The palatines have a row of teeth and are ankylosed with the pterygoids; the premaxillæ, dentaries and vomers carry teeth. The absence of a cartilage roof to the nasal cavity is one of the many characters in which *Proteus* agrees with *Menobranchus*, but differs from *Siren* and *Menopoma*. The suspensorium has only a simple pedicle, as in *Batrachia* and the hyoid arch is remarkable for the enormous hyo-mandibular element which is larger even than in many sharks. The notochord is scarcely constricted by the amphicœlous vertebrae and the intervertebral cartilages are at a minimum of development. There are twenty-nine trunk vertebrae, one sacral and twenty-eight caudal. The pectoral arch contains a long, thin, ossified scapula, a supra-scapula and a long precoracoid separated by a deep notch from the main coracoid; a fissure exists in the glenoid region. There is no sternum. The pectoral girdle is almost identical with that of *Menobranchus*. The pelvis has a narrow, tapering ischial region, well-marked prepubes and (?) a pointed epipubis; this girdle also is extremely like that of *Menobranchus*, but notably different from that of the *Xolotl*, which is only a pseudo-perenni-branchiate, and whose real affinities are with *Salamander* and *Triton*. The bones of the fore-

arm and leg are unanchylosed. There are three unossified carpal and tarsal elements, which Gegenbaur identifies as a radiale, ulnare and a fused distal row; such a carpus has no resemblance to either the embryonic or adult stage of any other amphibian. In the heart the auricular septum is incomplete; the truncus arteriosus bifurcates into two trunks; each divides into two, and the posterior of these again into two, thus forming the three aortic arches on each side. The pulmonary vein sends part only of its blood into the heart and part into the systemic veins. The blood-corpuscles are the largest known among vertebrates and are comparable to the exceedingly large corpuscles of the *Dipnoi*. The brain is very small, straight and embryonic in character. The gut is straight and the stomach is a scarcely perceptible dilatation. The thyroid (alone among amphibians) is unpaired. The lungs are long simple sacs, expanded distally, as in *Menobranchus*; the trachea is excessively short and the two cartilages which bound the glottis are continued into long processes which pass to the base of the lungs. As in *Siren*, *Siredon* and others, the lateral branch of the vagus nerve is connected with a series of sense-organs forming a "lateral line." These characters together indicate the exceedingly low position of *Proteus* among *Amphibia*; it and its close relative the American *Menobranchus* are the lowest of living *Amphibia*. The creature seems to be abundant within its limited habitat; it feeds on worms and small fishes, which, in spite of its blindness, it catches dexterously. It has bred in captivity and lays round, isolated eggs about a third of an inch in diameter. It changes color slightly in the breeding season and two rows of reddish spots make their appearance on the hinder part of the body. Such a change seems to indicate that the creature has not always lived in the absolute darkness in which it now spends its life. Individuals differ in some minor characters, and Cope (*Journ. Acad. Philadelphia*, v. p. 103, 1866) has based four new species on Hyrtl's specimens *P. zoisii*, *cararrae*, *xanthostichus*, *schreibersii*. Merrem altered the name of the genus to *Hypochthon* (*Gesch. der Amphibien*, 1790-1820).

Authorities.—*Proteus* was first described by Laurenti in his *Synopsis Reptilium* (Vienna, 1768, p. 37); his locality, Lake Zirkuitz, was erroneous. It was next mentioned by Scopoli (*Annus V. Hist. Nat.*, 1772). A full description, with plates, is given by Confogliachi and Rusconi (*Del proteo anguino di Laurenti*, 4to, Pavia, 1819). The brain has been described by Treviranus (*P. anguini encephalon*, 4to, Göttingen, 1820), the spinal cord by Klausner (*Rückenmark des P.*, 4to, Munich, 1883), the skull by Parker (*Phil. Trans.*, clxvii. pp. 568-573, 1877), the pectoral arch by Parker (*Shoulder-girdle*, p. 58, pl. iv.), the pelvis by Hoffmann (*Nederl. Arch.* iii. p. 144, 1877), the vertebral column by Mivart (*P. Z. S.*, 1870), the lateral line, etc., by Bugnion (*Bull. Soc. Vaud.*, xii. pp. 259-316, 1873), the eye by Desfosses (*Comptes rendus*, xciv. p. 1729, 1882), the kidney by Solger (*Abh. Ges. Halle*, xv. p. 405, 1882), the reproduction by Schultze (*Zeits. f. wiss. Zool.*, xxvi. p. 350, 1876) and M. V. Chauvin (*Zeits. f. wiss. Zool.*, xxxviii. 671-685, 1883), and the affinities with *Menobranchus* by Van d. Hoeven (*Arch. Neerl.*, i. p. 305, 1866; *Ann. and Mag. N. H.*, xviii. p. 363, 1866). See also anatomical details by Valentin (*Repert. f. Anat.*, i. p. 282, 1837, vi. p. 353, 1841), and many smaller papers.

PROTOGENES, a Greek painter, born in Caunus on the coast of Caria, but resident in Rhodes during the latter half of the 4th century B.C., was celebrated for the minute and laborious finish which he bestowed on his pictures, both in drawing and in color. Apelles, his great rival, standing astonished in presence of one of these works, could only console himself that he knew when to stop, whereas Protogenes did not. So also Petronius (*Satyr.* 83) experienced a sensation of horror at the too vivid realization of nature in which Protogenes indulged. On one picture, the Ialysus, he spent seven years; on another, the Satyr, he worked continuously during the siege of Rhodes by Demetrius Poliorcetes (305-4 B.C.) notwithstanding that the garden in which he painted was in the mid-

dle of the enemy's camp. Demetrius unsolicited took measures for his safety; more than that, when told that the Ialysus just mentioned was in a part of the town exposed to assault, Demetrius changed his plan of operations. Possibly the slowness and laboriousness of the work of Protogenes was due partly to a want of training in his youth. He appears to have been self-taught; some said that he had begun life as a ship-painter, and, though the painting of certain small figures of ships in a picture of his in Athens, however excellent it may have been, can hardly be held to confirm this account of his youth, it does not on the other hand render the account unreliable. It may have been due also to a want of early training that he found so much difficulty in rendering the foam at the mouth of a dog which occurred in the picture of Ialysus. Angry at his many failures, he dashed the sponge wet with the white color which he had just wiped off at the mouth of the dog. The result was a perfectly successful foam. Ialysus was a local hero, the founder of the town of the same name in the island of Rhodes, and probably he was represented as a huntsman. The picture was still in Rhodes in the time of Cicero, but was afterwards removed to Rome, where it perished in the burning of the temple of Peace. On another occasion Protogenes seems to have used his sponge with a different effect. The picture painted during the siege of Rhodes consisted of a satyr leaning idly against a pillar on which was a figure of a partridge so life-like that ordinary spectators saw nothing but it. Enraged on this account, the painter wiped out the partridge. The Satyr must have been one of his last works. He would then be about seventy years of age, and had enjoyed for about twenty years a reputation next only to that of Apelles, his friend and benefactor. Both were finished colorists so far as the fresco-painting of their day permitted, and both were laborious in the practice of drawing, doubtless with the view to obtaining bold effects of perspective as well as fineness of outline. It was an illustration of this practice when Apelles, finding in the house of Protogenes a large panel ready prepared for a picture, drew upon it with a brush a very fine line which he said would tell sufficiently who had called. Protogenes on his return home took a brush with a different color and drew a still finer line along that of Apelles dividing it in two. Apelles called again; and, thus challenged, drew with a third color another line within that of Protogenes, who then admitted himself surpassed. This panel was seen by Pliny (*N. H.*, xxxv. 83) in Rome, where it was much admired, and where it perished by fire. In the gallery of the Propylæa at Athens was to be seen the panel by Protogenes in which occurred the figures of ships already mentioned. The subject consisted of two figures representing personifications of the coast of Attica, Paralus and Hammonias, to whom the presence of ships would be the more appropriate as the Athenians actually possessed two ships so named. For the council chamber at Athens he painted figures of the Thesmothete, but in what form or character is not known. Probably these works were executed in Athens, and it may have been then that he met Aristotle, who recommended him to take for subjects the deeds of Alexander the Great. In his Alexander and Pan he may have followed that advice in the idealizing spirit to which he was accustomed. To this spirit must be traced also his Cydippe and Tlepolemus, legendary personages of Rhodes. Among his portraits are mentioned those of the mother of Aristotle, Philiscus the tragic poet, and King Antigonus. But Protogenes was also a sculptor to some extent, and made several bronze statues of athletes, armed figures, huntsmen, and persons in the act of offering sacrifices.

PROTOPLASM. In most of the biological articles already before the reader, whether concerned with general questions, as BIOLOGY, ANATOMY, BOTANY, EMBRYOLOGY, EVOLUTION, HISTOLOGY, MORPHOLOGY, PHYSIOLOGY, etc., or even with special groups of living

beings, as ANIMAL KINGDOM, FORAMINIFERA, FUNGUS, PROTOZOA, etc., special reference has been made to protoplasm as the living matter from which all kinds of living beings are formed and developed, and to the properties of which all their functions are ultimately referred. Fundamentally important then as this substance is, whether we occupy the standpoint of morphology, physiology, or ætiology, an attempt must be made to outline the way in which our knowledge of it has been reached, to bring together by the aid of a short summary the statements of such preceding articles, and to supply means of extending the general idea thus obtained by reference to the original literature of the subject.

§ 1. *History.*—Among the varied and fruitful observations of the early microscopists, Rösel v. Rosenhof's excellent account (1755) of his "Proteus animalcule" (the familiar *Amœba*) is especially noteworthy as the earliest description of the form and movements of what we now know as a mass of living protoplasm. Such discoveries as those of rotation in the cell of *Chara* (Corti, 1772), and of similar movements in other plant cells (*Vallisneria*, Meyen, 1827; *Tradescantia*, R. Brown, 1831), are also memorable,—more so indeed in this relation than is the great contemporaneous movement in general histology, since this, though aided by the rapid improvement of the microscope, eagerly carried on by the united labors of zoologists and botanists, headed by Johannes Müller and Robert Brown, and culminating in the hands of Schleiden and Schwann (1838–39) in the fundamental morphological generalization of the cell-theory (see MORPHOLOGY), included views of the structure, origin, and function of the cell-substance alike erroneous and misleading. Knowledge had in fact to start afresh from the level of the unappreciated discovery of Rosenhof; and it is accordingly from the observations of Dujardin on *Foraminifera* (1835) that our modern knowledge of protoplasm dates. His main account is still worth reading in his own words. In proposing the term "sarcode," he says, "je propose de nommer ainsi ce que d'autres observateurs ont appelé une gelée vivante, cette substance glutineuse, diaphane, insoluble dans l'eau, se contractant en masses globuleuses, s'attachant aux aiguilles de dissection, et se laissant étirer comme du mucus, enfin se trouvant dans tous les animaux inférieurs interposée aux autres éléments de structure." Though thus dissipating many errors, and placing the study of the lowest forms of life on its true basis, Dujardin unfortunately did not see the full bearing of his discovery. He recognized his sarcode, however, in the polyps, and noted that the ova of the slug exhibited similar movements. The next important step was not taken until 1846, when the botanist Hugo von Mohl, working on quite independent lines, reached a clearly defined conception of the vegetable cell, not only, as usual hitherto, distinguishing the cell-wall and the nucleus from the cell contents (*Zellsaft*), but also the "tough, slimy, granular, semi-fluid" constituent from the watery cell-sap hitherto generally confused with it under the common name. For this substance (which Schleiden had already vaguely mentioned as "Schleim") he proposed the term "protoplasma" (*πρωτος*, first, *πλάσμα*, formed substance). The discovery of the amœboid movements of colorless blood corpuscles dates from the same year, and the basis was thus prepared for Ecker's acute comparison (1849) of the "formed contractile substance" of muscle with the "unformed contractile substance" of the lowest types of animal life. This speculation, so profoundly anticipatory of our present standpoint (see PHYSIOLOGY), was greatly strengthened when Donders shortly afterwards succeeded in referring contractility from the cell-membrane to the cell-substance. Cohn's researches among microscopic plants and animals, and particularly his study of the transition, which at that time seemed so marvellous and so perplexing, from plant-like quiescence to ani-

mal-like activity, exhibited by the protoplasm of such an alga as *Protooccus* on escaping from its cell-wall, led him to suggest that vegetable protoplasm and animal sarcode, "if not identical, must be at any rate in the highest degree analogous substances." This speculation again ran too far in advance of current conceptions, dominated as these were by the errors which accompanied the cell-theory, and another decade of research was needed for its establishment. This was effected on several simultaneous and convergent lines. The botanical evidence culminated in De Bary's classical monograph of the *Mycomycetes* (1859); the study of the segmentation of the ovum, and the rapid advance of animal histology, both largely due to Kölliker, were of marked importance; while the clear identification of the vegetable "protoplasm" with the animal "sarcode," requiring, as it did, a mastery of all these lines and results of inquiry, was finally effected by M. SCHULTZE (*q.v.*), whose researches on *Foraminifera* (1854), and subsequent admirable studies in animal histology, prepared him to accomplish the definite reform of the cell-theory. This he did by fully and finally replacing (1861-63) the early conception of the cell as an all-important membrane enclosing a nucleus surrounded by fluid by that of a unit-mass of living matter of protoplasm (the nucleus alone being viewed as essential, the wall or membrane no longer so). Our present usage of the term protoplasm for the living substance of the animal as well as of the plant dates from Schultze's paper ("Ueber Muskelkörperchen und das was man eine Zelle zu nennen habe," *Arch. f. Anat. u. Physiol.*, 1861); and the term sarcode, notwithstanding Dujardin's priority, has since lapsed into disuse, save to some extent among French authors.

This rejuvenescence of the cell theory, in a form pointing to a far deeper unity of the forms and processes of organic nature than its founders had ventured to dream, marks the commencement of a new epoch of detailed investigation of all the forms, aspects, conditions, and products of protoplasmic life; but in this movement the workers are too numerous for mention save in so far as may be incidental in the following scanty reference to some of their main results (1).¹

§ 2. *Appearance and Properties of Protoplasm.*—To obtain a notion of the appearance and physical properties of protoplasm, it is expedient as it were to repeat the process of discovery, and acquire concrete ideas by actual observation as far as possible, or at least from good figures. The *Amoeba* (see PROTOZOA) and the FORAMINIFERA (*q.v.*) thus afford convenient and classical examples of the protoplasm of the lowest animal forms; the colorless corpuscles of blood should also be examined, and the structure of the higher tissues (see ANATOMY and HISTOLOGY) inquired into, and the segmentation of an ovum (see REPRODUCTION) observed,—most conveniently perhaps in frog spawn. Vegetable examples are readily obtained from the cells of a growing shoot (see BOTANY, vol. iv. pp. 73 sq., Figs. 1 and 6); while the living cells of *Chara* (BOTANY, Fig. 7) and other examples of protoplasmic movement should be observed. Thus, with the aid of the descriptive passages to be found in the articles referred to at the outset, a tolerably clear idea of a mass of protoplasm, with its contained granules of various kinds and its sap-vacuoles, will be obtained; and its frequent differentiation into an outer layer or ectoplasm, clearer and denser, passing into an inner layer or endoplasm, usually more fluid and granular, will be noted. A finely reticulated structure of the protoplasm may also be made out in many cases; the nucleus (inconspicuous since equally refracting with the protoplasm during life, but brought out clearly after death by the process of internal digestion of the surrounding protoplasm, or by the application of dyes and other reagents), and its contained nucleolus, as well as the cell-wall when present, will be observed. Wide variations of consistency will thus be noted from the comparatively solid, almost

brittle, state of the quiescent protoplasm of some seeds to its thin, syrupy, and largely vacuolated state in a growing vegetable tissue (*cf.* BOTANY, Fig. 6). Such structural inquiries are now in active progress, especially in connection with the process of cell division (see HISTOLOGY, REPRODUCTION), and many questions of detail are more or less under active dispute, *e.g.*, the relation of the nucleus to the protoplasm the existence or constancy of an internal network (the "stroma") in both, the conditions of occurrence of that continuity of protoplasm lately shown to exist through the cell walls of many vegetable tissues, and soon (2).

§ 3. *Manifestations of Life (Functions).*—The vital properties or "functions" exhibited by undifferentiated living protoplasm (*e.g.*, *Amoeba*) are usually enumerated as contractility, irritability and automatism, reception and assimilation of food, metabolism with secretion and excretion, respiration, and reproduction. Thus we have represented all those functions which in higher animals seem to be confined to special tissues—which we accordingly recognize as muscular or nervous, secretory or excretory, respiratory, reproductive or the like. Yet in these organs, however apparently specialized to one function only, a residue of all or nearly all the other fundamental properties of protoplasm remains and may be redeveloped; and thus those functional changes (necessarily accompanying morphological evolution or change of environment) which we call "adaptation" and those pathological disturbances which we term "disease" are alike provided for. See BIOLOGY, PATHOLOGY, SELECTION AND VARIATION, also (3).

§ 4. *External Conditions of Life.*—See BIOLOGY.

§ 5. *Experimental Modification of the Conditions of Life.*—The behavior of protoplasm under various modifications of physical conditions has been investigated by Schultze, Kühne, Strasburger, Engelmann, and others, while not a few researches are also extant as to the behavior of living cells under various chemical stimuli, among which those of Darwin (see INSECTIVOROUS PLANTS) and Frommann may be mentioned as especially suggestive. See also SCHIZOMYCETES, NUTRITION, and (4).

§ 6. *Chemical Composition and Processes.*—This aspect of protoplasm is of constantly increasing importance, since for the chemist all functions alike can only be viewed in terms of those specific anabolic or katabolic changes which to the physiologist, on the other hand, seem mere accompaniments of them (see PHYSIOLOGY, NUTRITION, REPRODUCTION). The determination of the chemical nature of protoplasm is thus the supreme problem of physiological chemistry; and, while, thanks to the labors of Reinke, E. Schultze, and others, there has been a rapidly increasing knowledge of its anastates, but more especially of its katabates, and of many cases of the unity of metabolic processes throughout nature, several daring general hypotheses are already in the field. Of these that of Schützenberger, who views proteid bodies as complex ureides, and that of Loew and Bokorny, who regard them as a complex mixture of aldehyde groups, are examples. See (5).

§ 7. *Molecular Constitution.*—Many hypotheses as to the minute structure of protoplasm have been proposed; thus Spencer resolves protoplasm into "physiological units," Haeckel into "plastitules," while Darwin accounts for heredity by reference to the properties of supposed "gemmules." Engelmann suggests the existence of "contractile units" (*isotagmen*), etc.; but those various hypotheses, framed mostly for special purposes, still await more general criticism. See (6).

§ 8. *Origin of Protoplasm.*—See ABIOGENESIS, BIOLOGY, REPRODUCTION, and (7).

PROTOZOA

PROTOZOA is the name applied to the lowest grade of the animal kingdom, and originated as a translation of the German term "Urthiere." Whilst at first used some forty years ago in a vague sense, without any strict definition, so as to include on the one hand some simple organisms which are now regarded as plants and on the other some animals which are now assigned a higher place in the animal series, the term has within the last twenty years acquired a very clear signification.

The Protozoa are sharply and definitely distinguished from all the rest of the animal kingdom, which are known by the names "Metazoa" or "Enterozoa." They are those animals which are structurally single "cells" or single corpuscles of protoplasm, whereas the Enterozoa consist of many such units arranged definitely (in the first instance) in two layers—an endoderm on enteric cell-layer and an ectoderm or dermic cell-layer—around a central cavity, the enteron or common digestive cavity, which is in open communication with the exterior by a mouth.

The Protozoa are then essentially unicellular animals. The individual or person in this grade of the animal kingdom is a single cell; and, although we find Protozoa which consists of aggregates of such cells, and are entitled to be called "multicellular," yet an examination of the details of structure of these cell-aggregates and of their life-history establishes the fact that the cohesion of the cells in these instances is not an essential feature of the life of such multicellular Protozoa but a secondary and non-essential arrangement. Like the budded "persons" forming, when coherent to one another, undifferentiated "colonies" among the Polyps and Corals, the coherent cells of a compound Protozoon can be separated from one another and live independently; their cohesion has no economic significance. Each cell is precisely the counterpart of its neighbor; there is no common life, no distribution of function among special groups of the associated cells, and no corresponding differentiation of structure. As a contrast to this we find even in the simplest Enterozoa that the cells are functionally and structurally distinguishable in two groups—those which line the enteron or digestive cavity and those which form the outer body wall. The cells of these two layers are not interchangeable; they are fundamentally different in properties and structure from one another. The individual Enterozoon is not a single cell; it is an aggregate of a higher order consisting essentially of a digestive cavity around which two layers of cells are disposed. The individual Protozoon is a single cell; a number of these individuals may, as the result of the process of fission (cell-division), remain in contact with one another, but the compound individual which they thus originate has not a strong character. The constituent cells are still the more important individuali-

ties; they never become differentiated and grouped in distinct layers differing from one another in properties and structure; they never become subordinated to the individuality of the aggregate produced by their cohesion; hence we are justified in calling even these exceptional aggregated Protozoa unicellular.

By far the larger number of Protozoa are absolutely single isolated cells, which, whenever they duplicate themselves by that process of division common to these units of structure (whether existing as isolated organisms or as constituents of the tissues of plants or of animals), separate at once into two distinct individuals which move away from one another and are thenceforward strangers.

Whilst it is easy to draw the line between the Protozoa and the Enterozoa or Metazoa which lie above them, on account of the perfectly definite differentiation of the cells of the latter into two primary tissues, it is more difficult to separate the Protozoa from the parallel group of unicellular plants.

Theoretically there is no difficulty about this distinction. There is no doubt that organisms present themselves to us in two great series starting in both cases from simple unicellular forms. The one series, the plants, can take up the carbon, hydrogen, oxygen, and nitrogen necessary to build up their growing protoplasm from mineral compounds soluble in water, compounds which constitute the resting stage of those elements in the present physical conditions of our planet. Plants can take their nitrogen in the form of ammonia or in the form of nitrates and their carbon in the form of carbonic acid. Accordingly they require no mouths, no digestive apparatus; their food being soluble in water and diffusible, they absorb at all or many points of their surface. The spreading diffuse form of plants is definitely related to this fact. On the other hand the series of organisms which we distinguish as animals cannot take the nitrogen, necessary to build up their protoplasm, in a lower state of combination than it presents in the class of compounds known as albumens; nor can they take carbon in a lower state of combination than it presents when united with hydrogen or with hydrogen and oxygen to form fat, sugar, and starch. Albumens and fats are not soluble in water and diffusible; they have to be seized by the animal in the condition of more or less solid particles, and by chemical processes superinduced in the living protoplasm of the animal by the contact of these particles they are acted upon, chemically modified, and rendered diffusible. Hence the animal is provided with a mouth and a digestive cavity, and with organs of locomotion and prehension by which it may search out and appropriate its scattered nutriment. Further the albumens, fats, sugars, and starch which are the necessary food of an animal are not found in nature excepting as the products of the life of plants or of animals; accordingly all ani-

mals are in a certain sense parasitic upon either plants or other animals. It would therefore seem to be easy to draw the line between even the most minute unicellular plants, and the similarly minute unicellular animals—assigning those which feed on the albumens, etc., of other organisms by means of a mouth and digestive apparatus to the animal series, and those which can appropriate the elements of ammonia, nitrates, and carbonates to the plants.

Such absolute distinctions lending themselves to sharp definitions have, however, no place in the organic world; and this is found to be equally true whether we attempt to categorically define smaller groups in the classification of plants and animals or to indicate the boundaries of the great primary division which those familiar names imply. Closely allied to plants which are highly and specially developed as plants, and feed exclusively upon ammonia, nitrates, and carbonates, we find exceptionally modified kinds which are known as "insectivorous plants" and are provided with digestive cavities (the pitchers of pitcher-plants, etc.), and actually feed by acting chemically upon the albumens of insects which they catch in these digestive receptacles. No one would entertain for a moment the notion that these insectivorous plants should be considered as animals. The physiological definition separating plant from animal breaks down in their case; but the consideration of the probable history of their evolution as indicated by their various details of structure suffices at once to convince the most skeptical observer that they actually belong to the vegetable line of descent or family tree, though they have lost the leading physiological characteristic which has dominated the structure of other plants. In this extreme case it is made very obvious that in grouping organisms as plants or as animals we are not called upon to apply a definition but to consider the multifarious evidences of historical evolution. And we find in the case of the Protozoa and the Protophyta that the same principle holds good, although, when dealing with extremely simple forms, it becomes much more difficult to judge of the genetic relationship of an organism in proportion as the number of detailed points of possible agreement with and divergence from other forms to which it may be supposed to be related are few.

The feeding of plants upon carbonic acid is invariably accompanied by the presence of a peculiar green-coloring matter—chlorophyll. In virtue of some direct or indirect action of this chlorophyll the protoplasm of the plant is enabled to seize the carbon of the mineral world—the carbon which has sunk to the lowest resting stage of combination—and to raise it into combination with hydrogen and oxygen and ultimately with nitrogen. There are plants which have no chlorophyll and are thus unable to feed upon carbonic acid. They are none the less plants since they agree closely with particular chlorophyll-bearing plants in details of form and structure, mode of growth and reproduction. A large series of these are termed Fungi. Though unable to feed on carbonic acid, they do not feed as do animals. They can take their carbon from acetates and tartrates, which animals cannot do, and their nitrogen from ammonia. Even when it is admitted that some of these colorless plants, such as the Bacteria (Schizomycetes), can act upon albumens so as to digest them and thus nourish themselves, it is not reasonable to place the Bacteria among animals, any more than it would be reasonable so to place Nepenthes, Sarracenia, and Drosera (insectivorous Phanerogams). For the structure and mode of growth of the Bacteria is like that of well-known chlorophylligerous minute Algae from which they undoubtedly differ only in having secondarily acquired this peculiar mode of nutrition, distinct from that which has dominated and determined the typical structure of plants.

So we find in a less striking series of instances amongst animals that here and there the nutritional

arrangements which we have no hesitation in affirming to be the leading characteristic of animals, and to have directly and perhaps solely determined the great structural features of the animal line of descent, are largely modified or even altogether revolutionized. The green Hydra, the fresh-water Sponge, and some Planarian worms produce chlorophyll corpuscles in the protoplasm of their tissues just as green plants do, and are able in consequence to do what animals usually cannot do—namely, feed upon carbonic acid. The possibilities of the protoplasm of the plant and of the animal are, we are thus reminded, the same. The fact that characteristically and typically plant protoplasm exhibits one mode of activity and animal protoplasm another does not prevent the protoplasm of even a highly developed plant from asserting itself in the animal direction, or of a thoroughly characterized animal, such as the green Hydra, from putting forth its chlorophylligenous powers as though it belonged to a plant.

Hence it is not surprising that we find among the Protozoa, notwithstanding that they are characterized by the animal method of nutrition and their forms determined by the exigencies of that method, occasional instances of partial vegetable nutrition such as is implied by the development of chlorophyll in the protoplasm of a few members of the group. It would not be inconsistent with what is observed in other groups should we find that there are some unicellular organisms which must, on account of their structural resemblances to other organisms, be considered as Protozoa and yet have absolutely given up altogether the animal mode of nutrition (by the ingestion of solid albumens) and have acquired the vegetable mode of absorbing ammonia, nitrates, and carbonic acid. Experiment in this matter is extremely difficult, but such "vegetable" or "holophytic nutrition" appears to obtain in the case of many of the green Flagellata, of the Dinoflagellata, and possibly of other Protozoa.

On the other hand there is no doubt that we may fall into an error in including in the animal line of descent all unicellular organisms which nourish themselves by the inception of solid nutriment. It is conceivable that some of these are exceptional creophagous Protophytes parallel at a lower level of structure to the insectivorous Phanerogams. In all cases we have to balance the whole of the evidence and to consider probabilities as indicated by a widely-reaching consideration of numerous facts.

The mere automatic motility of unicellular organisms was at one time considered sufficient indication that such organisms were animals rather than plants. We now know that not only are the male reproductive cells of ferns and similar plants propelled by vibratile protoplasm, but such locomotive particles are recognized as common products ("swarm-spores" and "zoospores") of the lowest plants.

The danger of dogmatizing erroneously in distinguishing Protozoa from Protophyta, and the insuperable difficulty in really accomplishing the feat satisfactorily, has led at various times to the suggestion that the effort should be abandoned and a group constituted confessedly containing both unicellular plants and unicellular animals and those organisms which may be one or the other. Haeckel has proposed to call this group the Protista (1).¹ On the whole, it is more satisfactory to make the attempt to discriminate those unicellular forms which belong to the animal line of descent from those belonging to the vegetable line. It is, after all, not a matter of much consequence if the botanist should mistakenly claim a few Protozoa as plants and the zoologist a few Protophyta as animals. The evil which we have to avoid is that some small group of unattractive character should be rejected both by botanist and zoologist and thus our knowledge of it should unduly lag. Bearing this in mind the zoologist should accord recognition as Protozoa

¹ These numbers refer to the bibliography at p. 891.

to as wide a range of unicellular organisms as he can without doing violence to his conceptions of probability.

A very interesting and very difficult subject of speculation forces itself on our attention when we attempt to draw the line between the lowest plants and the lowest animals, and even comes again before us when we pass in review the different forms of Protozoa.

That subject is the nature of the first protoplasm which was evolved from not-living matter on the earth's surface. Was that first protoplasm more like animal or more like vegetable protoplasm as we know it to-day? By what steps was it brought into existence?

Briefly stated the present writer's view is that the earliest protoplasm did not possess chlorophyll and therefore did not possess the power of feeding on carbonic acid. A conceivable state of things is that a vast amount of albuminoids and other such compounds had been brought into existence by those processes which culminated in the development of the first protoplasm, and it seems therefore likely enough that the first protoplasm fed upon these antecedent steps in its own evolution just as animals feed on organic compounds at the present day, more especially as the large creeping plasmodia of some Mycetozoa feed on vegetable refuse. It indeed seems not at all improbable that, apart from their elaborate fructification, the Mycetozoa represent more closely than any other living forms the original ancestors of the whole organic world. At subsequent stages in the history of this archaic living matter chlorophyll was evolved and the power of taking carbon from carbonic acid. The "green" plants were rendered possible by the evolution of chlorophyll, but through what ancestral forms they took origin or whether more than once, *i.e.*, by more than one branch, it is difficult even to guess. The green Flagellate Protozoa (Volvocineae) certainly furnish a connecting point by which it is possible to link on the pedigree of green plants to the primitive protoplasm; it is noteworthy that they cannot be considered as very primitive and are indeed highly specialized forms as compared with the naked protoplasm of the Mycetozoon's plasmodium.

Thus then we are led to entertain the paradox that though the animal is dependent on the plant for its food yet the animal preceded the plant in evolution, and we look among the lower Protozoa and not among the lower Protophyta for the nearest representatives of that first protoplasm which was the result of a long and gradual evolution of chemical structure and the starting point of the development of organic form.

The Protozoon. Cell-Individual compared with the Typical Cell of Animal and Vegetable Tissues.

MORPHOLOGY.

The Protozoon individual is a single corpuscle of protoplasm, varying in size when adult from less than the $\frac{1}{1000}$ th of an inch in diameter (some Sporozoa and Flagellata) up to a diameter of an inch (Nummulites), and even much larger size in the plasmodia of Mycetozoa. The substance of the Protozoa exhibits the same general properties—irritability, movement, assimilation, growth, and division—and the same irremediable chemical alteration as the result of exposure to a moderate heat, which are observed in the protoplasm constituting the corpuscles known as cells which build up the tissues of the larger animals and plants. There is therefore no longer any occasion to make use of the word "sarcode" which before this identity was established was very usefully applied by Dujardin (2) to the substance which mainly forms the bodies of the Protozoa. Like the protoplasm which constitutes the "cells" of the Enterozoa and of the higher plants, that of the Protozoon body is capable of producing, by chemical processes which take place in its substance (over and above those related merely to its nutrition), a variety of distinct chemical compounds, which may form a deposit in or beyond the superficial protoplasm of the corpuscle or may accumulate centrally. These products are therefore either ectoplasmic or entoplasmic. The chemical capacities of protoplasm thus exhibited are very diverse, ranging from the production of a denser variety of protoplasm, probably as the result of dehydration, such as we see in the nucleus and in the cortical substance of many cells, to the chemical

separation and deposition of membranes of pure chitin or of cellulose or of shells of pure calcium carbonate or quasi-crystalline needles of silica.

NUCLEUS.—The nucleus is probably universally present in the Protozoon cell, although it may have a very simple structure and be of very small size in some cases. The presence of a nucleus has recently been demonstrated by means of appropriate staining reagents in some Protozoa (shell-bearing Reticularia or Foraminifera and many Mycetozoa) where it had been supposed to be wanting, but we are not yet justified in concluding absolutely that there are not some few Protozoa in which this central differentiation of the protoplasm does not exist; it is also a fact that in the young forms of some Protozoa which result from the breaking up of the body of the parent into many small "spores" there is often no nucleus present.

In contrast to this it is the fact that the cells which build up the tissues of the Enterozoa are all derived from the division of a nucleated egg-cell and the repeated division of its nucleated products, and are invariably nucleated. The same is true of tissue-forming plants, though there are a few of the lowest plants, such as the Bacteria, the protoplasm of which presents no nucleus. In spite of recent statements (3) it cannot be asserted that the cells or protoplasmic corpuscles of the yeast-plant (*Saccharomyces*) and of the hyphae of many simple moulds contain a true nucleus. We are here brought to the question "What is a true nucleus?" The nucleus which is handed on from the egg-cell of higher plants and Enterozoa to the cells derived from it by fission has lately been shown to possess in a wide variety of instances such very striking characteristics that we may well question whether every more or less distinctly outlined mass or spherule of protoplasm which can be brought into view by coloring or other reagents, within the protoplasmic body of a Protozoon or a Protophyte, is necessarily to be considered as quite the same thing as the nucleus of tissue-forming egg-cell-derived cells.

Researches, chiefly due to Flemming (4), have shown that the nucleus in very many tissues of higher plants and animals consists of a capsule containing a plasma of "achromatin" not deeply stained by reagents, ramifying in which is a reticulum of "chromatin" consisting of fibres which readily take a deep stain (Fig. I., A). Further it is demonstrated that, when the cell is about to divide into two, definite and very remarkable movements take place in the nucleus, resulting in the disappearance of the capsule and in an arrangement of its fibres first in the form of a wreath (Fig. I., D) and subsequently (by the breaking of the loops formed by the fibres) in the form of a star (E). A further movement within the nucleus leads to an arrangement of the broken loops in two groups (F), the position of the open ends of the broken loops being reversed as compared with what previously obtained. Now the two groups diverge, and in many cases a striated appearance of the achromatin substance between the two groups of loops of chromatin is observable (H). In some cases (especially egg-cells) this striated arrangement of the achromatin substance precedes the separation of the loops (G). The striated achromatin is then termed a "nucleus-spindle," and the group of chromatin loops (Fig. I., G. a) is known as "the equatorial plate." At each end of the nucleus-spindle in these cases there is often seen a star consisting of granules belonging to the general protoplasm of the cell (G, c). These are known as "polar stars." After the separation of the two sets of loops (H) the protoplasm of the general substance of the cell becomes constricted, and division occurs, so as to include a group of chromatin loops in each of the two fission products. Each of these then rearranges itself together with the associated achromatin into a nucleus such as was present in the mother-cell to commence with. This phenomenon is termed "karyokinesis," and has been observed, as stated above, in a large variety of

cells constituting tissues in the higher animals and plants.

There is a tendency among histologists to assume that this process is carried out in all its details in the division of all cells in the higher plants and animals, and accordingly to assume that the structural differentiation of achromatin plasma and chromatin nucleus-fibres exists in the normal nucleus of every such cell. If this be true, it is necessary to note very distinctly that

FIG. I.—Karyokinesis of a typical tissue-cell (epithelium of Salamander) after Flemming and Klein. The series from A to I represent the successive stages in the movement of the chromatin fibres during division, excepting G, which represents the "nucleus-spindle" of an egg-cell. A, resting nucleus; D, wreath-form; E, single star, the loops of the wreath being broken; F, separation of the star into two groups of U-shaped fibres; H, diaster or double star; I, completion of the cell-division and formation of two resting nuclei. In G the chromatin fibres are marked *a*, and correspond to the phase shown in F; they are in this case called the "equatorial plate"; *b*, achromatin fibres forming the nucleus-spindle; *c*, granules of the cell-protoplasm forming a "polar star." Such a polar star is seen at each end of the nucleus-spindle, and is not to be confused with the diaster H.

the nucleus of the Protozoon cell-individual by no means conforms universally to this model. As will be seen in the sequel, we find cases in which a close approach is made by the nucleus of Protozoa to this structure and to this definite series of movements during division (Fig. VIII. 3 to 12, and Fig. XXV.); and a knowledge of these phenomena has thrown light upon some appearances (conjugation of the Ciliata) which were previously misinterpreted. But there are Protozoa with a deeply-placed nucleus-like structure which does not present the typical structure above described nor the typical changes during division, but in which on the contrary the nucleus is a very simple homogeneous corpuscle or vesicle of more readily stainable protoplasm.

The difficulties of observation in this matter are great and it is proportionately rash to generalize; but it appears that we are justified at the present moment in asserting that not all the cells even of higher plants and animals exhibit in full detail the structure and movement of the typical cell-nucleus above figured and described; and accordingly the fact that such structure and movement cannot always be detected in the protozoon cell-nucleus must not be regarded as either an isolated phenomenon peculiar to such Protozoon cells, nor must it be concluded that we have only to improve our means of analysis and observation in order to detect this particular structure in all nuclei. It seems quite possible and even probable that nuclei may vary in these details and yet be true nuclei. Some nuclei which are observed in Protozoon cell-bodies may be regarded as being at a lower stage of differentiation and specialization than are those of the epithelial and embryonic cells of higher animals which exhibit typical karyokinesis. Others on the contrary, such as the nuclei of some Radiolaria (*vide infra*), are probably to be regarded as more highly developed than any tissue cell-nuclei, and will be found by further study to present special phenomena peculiar to themselves. In

some of the highest Protozoa (the Ciliata) it has lately been shown that the nucleus may have no existence as such, but is actually dispersed throughout the protoplasm in the form of fine particles of chromatin-substance which stain on treatment with carmine but are in life invisible (84). This diffuse condition of the nuclear matter has no parallel, at present known, in tissue cells, and curiously enough occurs in certain genera of Ciliata whilst in others closely allied to them a solid single nucleus is found. The new results of histological research have necessitated a careful study of the nucleus in its various stages of growth and division in the cell-bodies of Protozoa and a comparison of the features there observed with those established as "typical" in tissue-cells. Accordingly we have placed the figure and explanation of the typical cell-nucleus in the first place in this article for subsequent reference and comparison.

CORTICAL SUBSTANCE.—The superficial protoplasm of an embryonic cell of an Enterozoon in the course of its development into a muscular cell undergoes a change which is paralleled in many Protozoa. The cortical layer becomes dense and highly refringent as compared with the more liquid and granular medullary substance. Probably this is essentially a change in the degree of hydration of the protoplasm itself, although it may be accompanied by the deposition of metamorphic products of the protoplasm which are not chemically to be regarded as protoplasm. The differentiation of this cortical substance (which is not a frequent or striking phenomenon in tissue-cells) may be regarded as an ectoplasmic (*i.e.*, peripheral) modification of the protoplasm, comparable to the entoplasmic (central) modification which produces a nucleus.

The formation of "cortical substance" in the Protozoa furnishes the basis for the most important division into lower and higher forms, in this assemblage of simplest animals. A large number (the Gymnomyxa) form no cortical substance; their protoplasm is practically (excepting the nucleus) of the same character throughout. A nearly equally large number (the Corticata) develop a complete cortical layer of denser protoplasm which is distinct from the deeper medullary protoplasm. This layer is permanent, and gives to the body a definite shape and entails physiological consequences of great moment. The cortical protoplasm may exhibit further specialization of structure in connection with contractile functions (muscular).

ECTOPLASTIC PRODUCTS CHEMICALLY DISTINCT FROM PROTOPLASM.—The protoplasm of all cells may throw down as a molecular precipitate distinct from itself chemical compounds, such as chitin and horny matter and other nitrogenized bodies, or again non-nitrogenous compounds, such as cellulose. Very usually these substances are deposited not external to but *in* the superficial protoplasm. They are then spoken of as cell-cuticle if the cell bounds the free surface of a tissue, or as matrix or cell-wall in other cases. The Protozoon cell-body frequently forms such "cuticles," sometimes of the most delicate and evanescent character (as in some Amoebæ), at other times thicker and more permanent. They may give indications (though proper chemical examination is difficult) of being allied in composition to chitin or gelatin, in other instances to cellulose, which is rare in animals and usual in plants. These cuticular deposits may be absent, or may form thin envelopes or in other cases jelly-like substance intimately mixed with the protoplasm (Radiolaria). They may take the form of hooks, tubercles, or long spines, in their older and more peripheral parts free from permeation by protoplasm, though deeply formed in and interpenetrated by it. Such pellicles and cuticles, the deeper layers (if not the whole) of which are permeated by protoplasm, lead insensibly to another category of ectoplasmic products in which the material

produced by the protoplasm is separated from it and can be detached from or deserted by the protoplasm without any rupture of the latter. These are—

Shells and Cysts.—Such separable investments are formed by the cell-bodies of many Protozoa, a phenomenon not exhibited by tissue-cells. Even the cell-walls of the protoplasmic corpuscles of plant tissues are permeated by that protoplasm, and could not be stripped off without rupture of the protoplasm. The shell and the cyst of the Protozoon are, on the contrary, quite free from the cell-protoplasm. The shell may be of soft chitin-like substance (*Gromia*, etc.), of cellulose (*Labyrinthula*, *Dinoflagellata*), of calcium carbonate (*Globigerina*, etc.), or of silica (*Clathrulina*, *Codonella*). The term "cyst" is applied to completely closed investments ("shells" having one or more apertures), which are temporarily produced either as a protection against adverse external conditions or during the breaking up of the parent-cell into spores. Such cysts are usually horny.

Stalks.—By a localization of the products of ectoplastic activity the Protozoon cell can produce a fibre or stalk of ever-increasing length, comparable to the seta of a Chaetopod worm produced on the surface of a single cell.

ENTOPLASTIC PRODUCTS DISTINCT FROM PROTOPLASM.—Without pausing here to discuss the nature of the finest granules which are embedded as a dust-cloud in the hyaline matrix of the purest protoplasm alike of Protozoa and of the cells of higher animals and plants, and leaving aside the discussion of the generalization that all protoplasm presents a reticular structure, denser trabeculae of extreme minuteness traversing more liquid material, it is intended here merely to point to some of the coarser features of structure and chemical differentiation, characteristic of the cell-body of Protozoa.

With regard to the ultimate reticular structure of protoplasm it will suffice to state that such structure has been shown to obtain in not a few instances (*e.g.*, *Lithamœba*, Fig. V.), whilst in most Protozoa the methods of microscopy at present applied have not yielded evidence of it, although it is not improbable that a reticular differentiation of the general protoplasm similar to that of the nucleus may be found to exist in all cells.

Most vegetable cells and many cells of animal tissues exhibit vacuolation of the protoplasm; *i.e.*, large spaces are present in the protoplasm occupied by a liquid which is not protoplasm and is little more than water with diffusible salts in solution. Such vacuoles are common in Protozoa. They are either permanent, gastric, or contractile.

Permanent vacuoles containing a watery fluid are sometimes so abundant as to give the protoplasm a "bubbly" structure (*Thalamophora*, *Radiolaria*, etc.), or may merely give to it a trabecular character (*Trachelius*, Fig. XXIV. 14, and *Noctiluca*, Fig. XXVI. 18). Such vacuoles may contain other matters than water, namely, special chemical secretions of the protoplasm. Of this nature are oil-drops, and from these we are led to those deposits within the cell-protoplasm which are of solid consistence (see below).

Gastric vacuoles occur in the protoplasm of most Protozoa in consequence of the taking in of a certain quantity of water with each solid particle of food, such ingestion of solid food-particles being a characteristic process bound up with their animal nature.

Contractile vacuoles are frequently but not universally observed in the protoplasm of Protozoa. They are not observed in the protoplasm of tissue-cells. The contractile vacuole whilst under observation may be seen to burst, breaking the surface of the Protozoon and discharging its liquid contents to the exterior; its walls, formed of undifferentiated protoplasm, then collapse and fuse. After a short interval it re-forms by slow accumulation of liquid at the same or a neighboring spot in the protoplasm. The liquid is separated

at this point by an active process taking place in the protoplasm which probably is of an excretory nature, the separated water carrying with it nitrogenous waste-products. A similar active formation of vacuoles containing fluid is observed in a few instances (*Arcella*, some *Amœbæ*) where the protoplasm separates a gas instead of liquid, and the gas vacuole so produced appears to serve a hydrostatic function.

Corpuscular and Amorphous Entoplastic Solids.—Concretions of undetermined nature are occasionally formed within the protoplasm of Protozoon cells, as are starch and nitrogenized concretions in tissue-cells (*Lithamœba*, Fig. V. *conc.*). But the most important corpuscular products after the nucleus, which we have already discussed, are chlorophyll corpuscles. These are (as in plants) concavo-convex or spherical corpuscles of dense protoplasm resembling that of the nucleus, which are impregnated superficially with the green-colored substance known as chlorophyll. They multiply by fission, usually tetraschistic, independently of the general protoplasm. They occur in representatives of many different groups of Protozoa (*Proteomyxa*, *Heliozoa*, *Labyrinthulidea*, *Flagellata*, *Ciliata*), but are confined to a few species. Similar corpuscles or band-like structures colored by other pigments are occasionally met with (*Dinoflagellata*).

Recently it has been maintained (Brandt, 5) that the chlorophyll corpuscles of Protozoa and other animals are parasitic Algæ. But, though it is true that parasitic Algæ occur in animal tissues, and that probably this is the nature of the yellow cells of *Radiolaria*, yet there seems to be no more justification for regarding the chlorophyll corpuscles of animal tissue-cells and of Protozoa as parasites than there is for so regarding the chlorophyll corpuscles of the leaves of an ordinary green plant.

Corpuscles of starch, paramylum, and other amyloid substances are commonly formed in the *Flagellata*, whose nutrition is to a large extent plant-like.

Entoplastic Fibres.—A fibrillation of the protoplasm of the Protozoon cell-body may be produced by differentiation of less and more dense tracts of the protoplasm itself. But as distinct from this we find horny fibres occasionally produced within the protoplasm (*Heliozoa*) having definite skeletal functions. The threads produced in little cavities in the superficial protoplasm of many Ciliate Protozoa, known as trichocysts, may be mentioned here.

Entoplastic Spicules.—Needle-like bodies consisting either of silica or of a horny substance (*acanthin*) are produced in the protoplasm of many Protozoa (*Heliozoa*, *Radiolaria*). These are known as spicules; they may be free or held together in groups and arranged either radially or tangentially in reference to the more or less spherical body of the Protozoon. A similar production of silicious spicules is observed in the tissue-cells of Sponges. Crystals of various chemical nature (silica, calcium carbonate, oxalate, etc.) are also frequently deposited in the protoplasm of the Protozoa, differing essentially from spicules in that their shape is due purely to crystallization.

GENERAL FORM OF THE PROTOZOON CELL.—Those Protozoa which have not a differentiated cortical substance, and are known as *Gymnomyxa*, present very generally an extreme irregularity of contour. Their protoplasm, being liquid rather than viscous, flows into the most irregular shapes. Their fundamental form when at rest is in many cases that of the sphere; others are discoidal or may be monaxial, that is to say, show a differentiation of one region or "end" of the body from the other. Frequently the protoplasm is drawn out into long threads or filaments which radiate uniformly from all parts of the spherical or discoidal cell-body or originate from one region to the exclusion of other parts of the surface.

These non-corticate Protozoa can take solid particles of food into their protoplasm, there to be digested in an extemporized "gastric vacuole," at any part or

most parts of their superficies. They have no permanent cell-mouth leading into the soft protoplasm since that soft protoplasm is everywhere freely exposed.

The corticate Protozoa have (with the exception of some parasites) one, and in the Acinetaria more than one, definite aperture in the cortical substance leading into the softer medullary protoplasm. This is the cell-mouth,—morphologically as distinct from the mouth of an Enterozoon as is the hole in a drain-pipe from the front door of a house, but physiologically subserving the same distinctively animal function as does the mouth of multicellular animals. The general form of the body is in these Protozoa oblong, with either monaxial symmetry, when the mouth is terminal, or bilateral symmetry, when the body is oblong and flattened and the mouth is towards one end of what becomes by its presence the “ventral” surface. Though the protoplasm is not nakedly exposed in irregular lobes and long filaments in these corticate Protozoa so as to pick up at all points such food particles as may fall in its way, yet the protoplasm does in most Corticata project in one or more peculiarly modified fine hair-like processes from the otherwise smooth surface of the cell-body. These processes are *vibratile cilia*, identical in character with the vibratile cilia of epithelial tissue-cells of Enterozoa. They are essentially locomotor and current-producing (therefore prehensile) organs, and, whilst unable to ingest solid food-particles themselves, serve to propel the organism in search of food and to bring food into the cell-mouth by the currents which they excite. Either a single vibratile filament is present, when it is called a flagellum, or a row or many rows of cilia are developed.

Constituent cells of the Enterozoa are well known which closely resemble some of the Gymnomyxa or non-corticate Protozoa in their general form. These are the colorless blood corpuscles or lymph corpuscles or phagocytes (Mecznikow, 6) which float freely in the blood and ingest solid particles at any part of their surface as do non-corticated Protozoa; they exhibit a similar irregularity and mutability of outline, and actually digest the particles which they take in. The endodermal digestive cells of some Enterozoa (Cœlentera and Planarians) are also naked protoplasmic corpuscles and can take in solid food-particles.

No tissue-cells are known which present any close parallel to the mouth-bearing corticate Protozoa. The differentiation of the structure of a single cell has in these forms reached a very high degree, which it is not surprising to find without parallel among the units which build up the individual of a higher order known as an Enterozoon. Cilia are developed on such cell-units (ciliated epithelium), but not used for the introduction of food-particles into the cell. In rare cases (the ciliated “pots” of the vascular fluid of Sipunculus) they act so as to freely propel the ciliated cell through the liquid “blood” of the Enterozoon, as the cilia of a Protozoon propel it through water. An aperture in the cortical substance (or in the cuticular product) of a tissue-cell is sometimes to be observed, but is never (?) used for the ingestion of food particles. Such an aperture occurs in unicellular glands, where it serves as the outlet of the secretion.

PHYSIOLOGY.

Motion.—As has just been hinted, the movement of protoplasm, which in the tissue-cells of Enterozoa and higher plants is combined and directed so as to produce effects in relation to the whole organism built up of countless cells, is seen in the Protozoa in a different relation, namely, as subserving the needs of the individual cell of which the moving protoplasm is the main substance. The phenomena known in tissue-cells as “streaming” (e.g., in the cells of the hairs of Tradescantia), as local contraction and change of form (e.g., in the corpuscles of the cornea), as muscular contraction, and as ciliary movement are all exhibited

by the protoplasm of the cell-body of Protozoa, with more or less constancy, and are intimately related to the processes of hunting, seizing, and ingesting food, and of the intercourse of the individuals of a species with one another and their evasion of hostile agencies. Granule streaming and the implied movement of currents in the protoplasm are seen in the filamentous protoplasm of the Heliozoa, Radiolaria, Reticularia, and Noctiluca, and in the cyclosis of the gastric vacuoles of Ciliata. Local contraction and change of form is seen best in the Amœbæ and some Flagellata, where it results in locomotion. Definite muscular contraction is exhibited by the protoplasmic band in the stalk of Vorticella, by the leg-like processes of the Hypotrichous Ciliata, and by the cortical substance of some large Ciliata. Ciliary movement ranging from the vibration of filaments of protoplasm temporarily evolved, up to the rhythmic beat of groups of specialized cilia, is observed in all groups of Protozoa in the young condition if not in the adult, and special varieties of ciliary movement and of cilia-like organs will be noted below. For an account of the conditions and character of protoplasmic movement generally which cannot be discussed in the present article the reader is referred to Engelmann (7).

The protoplasm of the cell-body of the Protozoa is drawn out into lobes and threads which are motile and are used as locomotive and prehensile organs. These processes are of two kinds, which are not present on the same cell and are not capable of transmutation, though there are exceptions to both of these statements. The one kind are termed “pseudopodia,” and are either lobose or filamentous or branched and even reticular (Figs. IV. and IX.). The Protozoa which exhibit them are sometimes termed Myxopods. The other kind are cilia and flagella, and are simple threads which are alternately bent and straightened almost incessantly during the life of the organism. These Protozoa are termed Mastigopods. Whilst the cilia and flagella are permanent organs, the pseudopodia vary greatly in character; they are in some cases rapidly expanded and withdrawn in irregular form, and can hardly be said to be more than lobose protuberances of the flowing moving mass of protoplasm. In other cases they are comparatively permanent stiff threads of protoplasm which can be contracted and can fuse with one another but rarely do so (Heliozoa, Radiolaria). Between these extreme forms of “pseudopodia” there are numerous intermediate varieties, and the whole protoplasmic body of the Protozoon may even assume the form of a slowly changing network of threads of greater or less tenuity (Chlamydomyxa, Fig. VI.).

Nutrition.—Typically—that is to say, by determinate hereditary tendency—the Protozoa take solid food particles into their protoplasm which form and occupy with the water surrounding them “gastric vacuoles” in the protoplasm. The food-particle is digested in this vacuole, by what chemical processes is not ascertained. It has been shown that the contents of the gastric vacuole give in some cases an acid reaction, and it is not improbable that free acid is secreted by the surrounding protoplasm. It is not known whether any ferment¹ is separated by the protoplasm, but it is probable from observations made on the digestive process of Cœlentera (Actiniæ) that the ferment is not separated, but that actual contact of the food-particle with the protoplasm is necessary for a “ferment influence” to be exerted. The digestion of a food-particle by a Protozoon is intra-cellular, and has been contrasted with the cavitary digestion of higher animals. In the latter, ferments and acids are poured out by the cells bounding the enteric cavity into that space, and digestion is extra-cellular. In the lowest Enterozoa

¹ The digestive ferment pepsin has been detected by Krukenberg in the plasmodium of the Mycetozoon Fulgo (flowers of tan). See on this subject Zopf (13), p. 88.

(many Coelentera and some Planarian worms) it has been shown that food-particles are actually taken up in a solid state by the soft protoplasm of the enteric cells and thus subjected to intra-cellular digestion. There appears to be a gradual transition from this process, in which close contact with living protoplasm is necessary that the solution of an albuminous food-particle may be effected, onwards to the perfectly free cavitary digestion by means of secretions accumulated in the enteron.

We have not yet any satisfactory observations on the chemistry of intra-cellular digestion either of Protozoa or of Coelentera.

Certain Protozoa which are parasitic do not take solid food particles; they (like higher parasites, such as the Tapeworms) live in the nutritious juices of other animals and absorb these by their general surface in a liquid state. The Gregarinae (Sporozoa), many Ciliata, etc., are in this case. Other Protozoa are known which are provided with chlorophyll corpuscles and do not take in solid food, but, apparently as a result of exceptional adaptation in which they differ from closely-allied forms, nourish themselves as do green plants. Such are the Volvocinean Flagellata and some of the Dinoflagellata. It has also been asserted that other Protozoa (viz., some Ciliata)—even some which possess a well-developed mouth—can (and experimentally have been made to) nourish themselves on nitrogenous compounds of a lower grade than albumens—such, for instance, as ammonium tartrate. Any such assertions must be viewed with the keenest skepticism, since experimental demonstrations of the absence of minute albuminous particles (*e.g.*, Bacteria) from a solution of ammonium tartrate in which Ciliate Protozoa are flourishing is a matter of extreme difficulty and has not yet been effected.

Undigested food-remnants are expelled by the protoplasm of the Protozoon cell either at any point of the surface or by the cell-mouth or by a special cell-anus (some Ciliata, see Fig. XXIV. 22).

Respiration and Excretion.—The protoplasm of the Protozoa respire, that is, takes up oxygen and liberates carbonic acid, and can readily be shown experimentally to require a supply of oxygen for the manifestation of its activity. No special respiratory structures are developed in any Protozoa, and as a rule also the products of oxidation appear to be washed out and removed from the protoplasm without the existence of any special apparatus. The contractile vacuole which exists in so many Protozoa appears, however, to be an excretory organ. It has been shown to rapidly excrete in a state of solution coloring matters (anilin blue) which have been administered with food particles (8). No evidence has been adduced to show whether traces of nitrogenous waste-products are present in the water expelled by the contractile vacuole.

Chemical Metamorphosis.—The form which the various products of the activity of the Protozoon's protoplasm may assume has been noted above. It will be sufficient here to point out that the range of chemical capacities is quite as great as in the cells of the higher Enterozoa. Chitin, cellulose, silicon, calcium carbonate, fats, pigments, and gases can be both deposited and absorbed by it. Owing to the minuteness of the Protozoa, we are at present unable to recognize and do justice to the variety of chemical bodies which undoubtedly must play a part in their economy as the result of the manufacturing activity of their protoplasm. See, however, Zopf (13), p. 71.

Growth and Reproduction.—The Protozoon cell follows the same course as tissue-cells, in that by assimilation of nutriment its protoplasm increases in volume and reaches a certain bulk, when its cohesion fails and the viscid droplet divides into two. The coefficient of cohesion varies in different genera and species, but sooner or later the disrupting forces lead to division, and thus to multiplication of individuals or reproduction. The phenomena connected with the

division of the nucleus (already alluded to) will be noticed in particular cases below.

Whilst simple binary division is almost without exception a chief method of reproduction among the Protozoa, it is also very usual, and probably this would be found if our knowledge were complete to have few exceptions, that under given conditions the Protozoon breaks up rapidly into many (from ten to a hundred or more) little pieces, each of which leads an independent life and grows to the form and size of its parent. It will then multiply by binary division, some of the products of which division will in their turn divide into small fragments. The small fragments are called "spores." Usually the Protozoon before breaking up into spores forms a "cyst" (see above) around itself. Frequently, but not as a necessary rule, two (rarely three or more) Protozoon cell-individuals come together and fuse into one mass before breaking up into spores. This process is known as "conjugation;" and there can be no doubt that the physiological significance of the process is similar to that of sexual fertilization, namely that the new spores are not merely fragments of an old individual but are something totally new inasmuch as they consist of a combination of the substance of individuals who have had different life experiences.

Whilst spore-formation is not necessarily preceded by conjugation, conjugation is not necessarily followed by spore-formation. Among the Mycetozoa the young individuals produced from spores conjugate at a very early period of growth in numbers and form "plasmodia," and after a considerable interval of feeding and growth the formation of spores takes place. Still more remarkable is the fact observed among the Ciliata where two individuals conjugate and after a brief fusion and mixture of their respective protoplasm separate, neither individual (as far as certain genera at least are concerned) breaking up into spores, but simply resuming the process of growth and recurrent binary division with increased vigor.

There is certainly no marked line to be drawn between reproduction by simple fission and reproduction by spore-formation; both are a more or less complete dividing of the parent protoplasm into separate masses; whether the products of the first fission are allowed to nourish themselves and grow before further fission is carried out or not does not constitute an essential difference. The fission of the Ciliate Protozoon, *Opalina* (see below Fig. XXIV. 4-8), is a step from the ordinary process of delayed binary division towards spore-formation. In some Protozoa spores are produced after encystation by a perfectly regular process of cleavage (comparable to the cleavage of the egg-cell of Enterozoa)—first two, then four, then eight, sixteen, and thirty-two fission products being the result (see Fig. XX. 24, 25, etc.).

But more usually there is a hastening of the process, and in these cases it is by no means clear what part the parent cell-nucleus takes. An encysted Gregarina (or two conjugated Gregarinae) suddenly breaks up into a number of equal-sized spores, which do not increase in number by binary division and have not been formed by any such process. This multicentral segregation of the parent protoplasm is a marked development of the phenomenon of sporulation and remote from ordinary cell-division. How it is related to ordinary cell-division is not known, inasmuch as the changes undergone by the nucleus in this rapid multicentral segregation of the parent protoplasm have not been determined. The spores of Protozoa may be naked or encased singly or in groups in little envelopes, usually of a firm horny substance (see Fig. XX. 23 to 26, and Fig. XXIV. 15 to 18). Whenever the whole or a part of a Protozoon cell divides rapidly into a number of equal-sized pieces which are simultaneously set free and are destined to reproduce the adult form, the term spore is applied to such pieces, but the details of their formation may vary and also those of their subsequent history.

In typical cases each spore produced as the result of the fission of an encysted Protozoon (conjugated or single) has its own protective envelope, as in the Mycetozoa (Fig. III.) and the Sporozoa (Fig. XVIII.), from which the contained protoplasm escapes by "germination" as a naked corpuscle either flagellate or amœbiform. In some terminologies the word "spore" is limited to such a "coated" spore, but usually the naked protoplasmic particles which issue from such "coated" spores, or are formed directly by the rapid fission of the parent Protozoon, are also called "spores." The former condition is distinguished as a "chlamydo-spore," whilst the latter are termed "gymnospores." Many Protozoa produce gymnospores directly by the breaking up of their protoplasm, and these are either "flagellulæ" (swarm-spores) or "amœbulæ" (creeping spores). The production of coated spores is more usual among the lower plants than it is among Protozoa, but is nevertheless a characteristic feature of the Gregarinæ (Sporozoa) and of the Mycetozoa. The term "gemma" or "bud-spore" is applied to cases, few in number, where (as in Acinetaria, Fig. XXVI., Spirochona, Fig. XXIII. 10, and Reticularia, Fig. X. 8) the spores are gradually nipped off from the parent-cell one or more at a time. This process differs from ordinary cell-division only in the facts (1) that the products of division are of unequal size—the parent-cell being distinguishable as the larger and more complete in structure, and (2) that usually the division is not binary, but more than one bud-spore is produced at a time.

Whilst in the binary cell-division of the Protozoa the two products are usually complete in structure at the period of separation, spores and spore-buds are not only of small size and therefore subject to growth before attaining the likeness of the parent, but they are also very often of simple and incomplete structure. The gap in this respect between the young spore and its parent necessarily varies according to the complexity of the parental form.

In the case of the Radiolaria, of the Gregarinæ, of Noctiluca, and of the Acinetaria, for instance, the spore has before it a considerable process of development in structure and not merely of growth, before attaining the adult characters. Hence there is a possible embryology of the Protozoa, to the study of which the same principles are applicable as are recognized in the study of the embryology of Enterozoa. Embryonic forms of great simplicity of structure, often devoid of nucleus, and consisting of simple elongate particles of protoplasm, are hatched from the spore-cases of the Gregarinæ (Fig. XVII. 13, 14). These gradually acquire a differentiated cortical protoplasm and a nucleus. A very large number of Gymnomyxa produce spores which are termed "monadiform," that is, have a single or sometimes two filaments of vibratile protoplasm extended from their otherwise structureless bodies. By the lashing of these flagella the spores (swarm-spores or zoospores) are propelled through the water. The resemblance of these monadiform young (best-called "flagellulæ") to the adult forms known as Flagellata has led to the suggestion that we have in them a case of recapitulative development, and that the ancestors of the Gymnomyxa were Protozoa similar to the Flagellata. Again the Acinetaria produce spores which are uniformly clothed with numerous vibratile cilia (Fig. XXVI.), although the adults are entirely devoid of such structures; this is accounted for by the supposition that the Acinetaria have been developed from ancestors like the Ciliata, whose characters are thus perpetuated in their embryonic stages. There can be little doubt that these embryological suggestions are on the whole justified and that the nucleated Protozoa are the descendants of non-nucleated forms similar to the spores of Gymnomyxa and Sporozoa, whilst it seems also extremely probable that the ancestral Protozoa were neither exclusively amœboid in the movement of their protoplasm nor provided with permanent

vibratile filaments (flagella and cilia); they were neither Myxopods nor Mastigopods (to use the terms which have been introduced to express this difference in the character of the locomotor processes), but the same individuals were capable of throwing out their protoplasm sometimes in the form of flowing lobes and networks, sometimes in the form of vibratile flagella. A few such indifferentiated forms exist at the present day among the Proteomyxa and in a little more advanced condition among the lowest Flagellata, e.g., Ciliophrys.

Death.—It results from the constitution of the Protozoon body as a single cell and its method of multiplication by fission that death has no place as a natural recurrent phenomenon among these organisms. Among the Enterozoa certain cells are separated from the rest of the constituent units of the body as egg-cells and sperm-cells; these conjugate and continue to live, whilst the remaining cells, the mere carriers as it were of the immortal reproductive cells, die and disintegrate. There being no carrying cells which surround, feed, and nurse the reproductive cells of Protozoa, but the reproductive cell being itself and alone the individual Protozoon, there is nothing to die, nothing to be cast off by the reproductive cell when entering on a new career of fission. The bodies of the higher animals which die may from this point of view be regarded as something temporary and non-essential, destined merely to carry for a time, to nurse, and to nourish the more important and deathless fission products of the unicellular egg. Some of these fission-products of the new individual developed from an egg-cell—namely, the egg-cells and sperm-cells—are as immortal as the unicellular Protozoon. This method of comparing the unicellular and the multicellular organism is exceedingly suggestive, and the conception we thus gain of the individuality of the Enterozoon throws light upon the phenomena of reproduction and heredity in those higher organisms.

Experiment and observation in this matter are extremely difficult; but we have no reason to suppose that there is any inherent limit to the process of nutrition, growth, and fission, by which continuously the Protozoa are propagated. The act of conjugation from time to time confers upon the protoplasm of a given line of descent new properties, and apparently new vigor. Where it is not followed by a breaking up of the conjugated cells into spores, but by separation and renewed binary fission (Ciliata), the result is described simply as "rejuvenescence." The protoplasm originated by the successive division of substance traceable to one parent cell has become specialized, and in fact too closely adapted to one series of life-conditions; a fusion of substance with another mass of protoplasm equally specialized, but by experience of a somewhat differing character, imparts to the resulting mixture a new combination of properties, and the conjugated individuals on separation start once more on their deathless career with renewed youth.

CLASSIFICATION OF THE PROTOZOA.

In attempting a scheme of classification it would be most in accordance with the accepted probabilities of the ancestral history of the Protozoa to separate altogether those forms devoid of a nucleus from those which possess one, and to regard them as a lower "grade" of evolution or differentiation of structure.

By some systematists, notably Bütschli (9), the presence or absence of a nucleus has not been admitted as a basis of classificatory distinction, whilst on the other hand both Haeckel (1) and Huxley (10) have insisted on its importance.

The fact is that during recent years many of those Protozoa which were at one time supposed to be devoid of nucleus even in a rudimentary form, and furnished therefore the tangible basis for a lowest group of "Protozoa Homogenea" or "Monera," have been shown by the application of improved methods of microscopic investigation to possess a nucleus, that is to say, a differentiated corpuscle of denser protoplasm lying within the general protoplasm, and capable when the organism is killed by alcohol or weak

acids of taking up the color of various dyes (such as carmine and hæmatoxylin) more readily and permanently than is the general protoplasm. In such cases the nucleus may be very small and exhibit none of the typical structure of larger nuclei. It is usually surrounded by a clear (*i.e.*, non-granular) halo of the general protoplasm which assists the observer in its detection. Nuclei have been discovered in many Reticularia (Foraminifera), a group in which they were supposed to be wanting, by Schultze (11) and the Hertwigs (12) and more recently in the Mycetozoa and in Vampyrella and Protomonas (Zopf, 13), where so excellent an observer as Cienkowski had missed them.

It seems therefore not improbable that a nucleus is present though not observed in Protomyxa, Myxastrum, and other similar forms which have been by Haeckel and others classed as "Monera" or "Homogenea." The recently described (14) *Archerina* (Fig. II. 8, 11) certainly possesses no nucleus in the usual sense of that term, but it is possible that the chlorophyll-colored corpuscles of that organism should be considered as actually representing the nucleus. Whilst then refraining from asserting that there are no existing Protozoa devoid of nucleus corresponding in this character with non-nucleate Protophyta, such as the Bacteria, we shall not in our scheme of classification institute a group of Homogenea, but shall leave the taking of that step until it has been shown after critical examination that those forms now regarded by some observers as Homogenea are really so. In the meantime these forms will find their places alongside of the Nucleata most nearly allied to them in other characters.

The Protozoa with a definite permanent cortical substance of differentiated protoplasm are undoubtedly to be regarded as evolved from forms devoid of such differentiation of their substance, and we accordingly take this feature as the indication of a primary division of the Protozoa.¹ The lower grade, the Gymnomyxa, afford in other respects evidence of their being nearly related to the ancestral forms from which the Corticata (the higher grade) have developed. The Gymnomyxa all or nearly all, whilst exhibiting amoeboid movement and the flowing of their protoplasm into "pseudopodia" of very varied shapes, produce spores which swim by means of one or two flagella of vibratile protoplasm (monadiform young or flagellulæ). These flagellate young forms are closely related to the Flagellata, a group of the Corticata from which it seems probable that the Dinoflagellata, the Ciliata, and the Acinetaria have been derived. The Gymnomyxa themselves cannot, on account of the small number of structural features which they offer as indications of affinity and divergence in genetic relationships *inter se*, be classified with anything like confidence in a genealogical system. We are obliged frankly to abandon the attempt to associate some of the simpler forms with their nearest genetic allies and to content ourselves with a more or less artificial system, which is not, however, artificial in so far as its main groups are concerned. Thus the genetic solidarity of each of the large classes Heliozoa, Reticularia, Mycetozoa, and Radiolaria is not open to question. The Lobosa on the other hand appear to be a more artificial assemblage, and it is difficult to say that genetically there is any wide separation between them and the Mycetozoa or between the Mycetozoa and some of the simpler forms which we bring together under the class Proteomyxa.

The scheme of classification which we adopt is the following:

PROTOZOA.

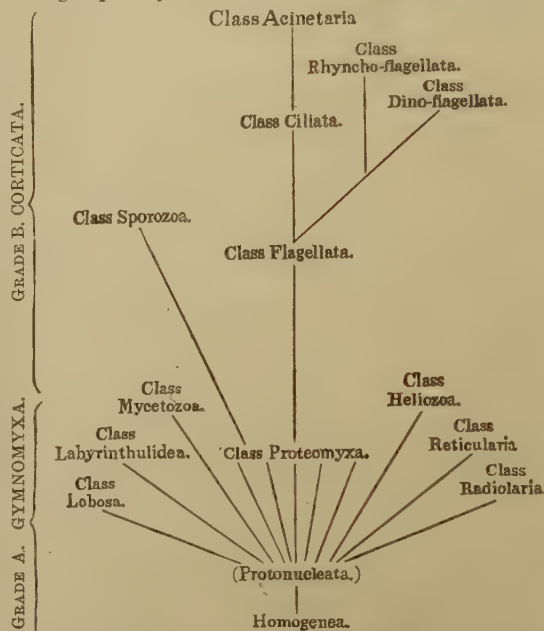

Sections.	GRADE A. GYMNOXYXA.
Proteana	Class I. PROTOMYXA. Ex. <i>Vampyrella</i> , <i>Protomyxa</i> , <i>Archerina</i> .
Plasmodiata.	Class II. MYCETOZOA. Ex. The <i>Eu-mycetozoa</i> of Zopf.
Lobosa.	Class III. LOBOSA. Ex. <i>Amœba</i> , <i>Arcella</i> , <i>Pelomyxa</i> .
	Class IV. LABYRINTHULIDEA. Ex. <i>Labrynthula</i> , <i>Chlamydomyxa</i> .
	Class V. HELIOZOA.
Filosa.	Ex. <i>Actinophrys</i> , <i>Raphidiophrys</i> , <i>Clathrulina</i> .
	Class VI. RETICULARIA.
	Ex. <i>Gromia</i> , <i>Lituola</i> , <i>Astrorhiza</i> , <i>Globigerina</i> .
	Class VII. RADOLARIA.
	Ex. <i>Thalassicolla</i> , <i>Eucyrtidium</i> , <i>Acanthometra</i> .

¹ The "exoplasm" and "endoplasm" described in *Amœba*, etc., by some authors are not distinct layers but one and the same continuous substance—what was internal at one moment becoming external at another, no really structural difference existing between them.

GRADE B. CORTICATA.

Lipostoma.	Class I. SPOROZOA. Ex. <i>Gregarina</i> , <i>Coccidium</i> .
	Class II. FLAGELLATA. Ex. <i>Monas</i> , <i>Salpingœca</i> , <i>Euglena</i> , <i>Volvox</i> .
	Class III. DINOFLAGELLATA. Ex. <i>Prorocentrum</i> , <i>Ceratium</i> .
Stomatophora.	Class IV. RHYNCHOFAGELLATA. Ex. <i>Noctiluca</i> .
	Class V. CILIATA. Ex. <i>Vorticella</i> , <i>Paramœcium</i> , <i>Stentor</i> .
	Class VI. ACINETARIA. Ex. <i>Acineta</i> , <i>Dendrosoma</i> .

The genetic relationships which probably obtain among these groups may be indicated by the following diagram:

Literature.—Certain works of an older date dealing with microscopic organisms, and therefore including many Protozoa, have historical interest. Among these we may cite O. F. Müller, *Animalcula Infusoria*, 1786; Ehrenberg, *Infusionsthierehen*, 1838; Dujardin, *Histoire naturelle des Infusoires*, 1841; Pritchard, *Infusoria*, 1857.

The general questions relating to protoplasm and to the constitution of the Protozoan body as a single cell are dealt with in the following more recent treatises: Max Schultze, *Ueber den Organismus der Polythalamien*, 1854, and *Ueber das Protoplasma der Rhizopoden und Pflanzenzellen*, 1863; and Engelmann, article "Protoplasma" in Hermann's *Handwörterbuch der Physiologie*, 1880.

Special works of recent date in which the whole or large groups of Protozoa are dealt with in a systematic manner with illustrations of the chief known forms are the following: Bütschli, "Protozoa," in Bronn's *Classen und Ordnungen des Thierreichs*, a comprehensive and richly illustrated treatise now in course of publication, forming the most exhaustive account of the subject matter of the present article which has been attempted (the writer desires to express his obligation to this work, from the plates of which a large proportion of the woodcut figures here introduced have been selected); W. S. Kent, *Manual of the Infusoria*, 1882—an exhaustive treatise including figures and descriptions of all species of Flagellata, Dinoflagellata, Ciliata, and Acinetaria; Stein, *Der Organismus der Infusionsthiere*, 1867–1882; Haeckel, *Die Radiolarien*, 1862; Archer, "Résumé of recent contributions to our knowledge of freshwater Rhizopoda," *Quart. Jour. of Microscopical Science*, 1876–77; Zopf, "Pilzthiere" (Mycetozoa), in *Encyclopädie der Naturwissenschaften*, Breslau, 1884.

We shall now proceed to consider the classes and orders of Protozoa in detail.

PROTOZOA.

Characters.—Organisms consisting of a single cell or of a group of cells not differentiated into two or more tissues; incapable of assimilating nitrogen in its diffusible compounds (ammonia or nitrates) or carbon in the form

of carbonates, except in special instances which there is reason to regard as directly derived from allied forms not possessing this capacity. The food of the Protozoa is in consequence as a rule taken in the form of particles into the protoplasm either by a specialized mouth or by any part of the naked cell-substance, there to be digested and rendered diffusible.

GRADE A. GYMNOXYXA, Lankester, 1878 (64).

Characters.—Protozoa in which the cell-protoplasm is entirely or partially exposed to the surrounding medium, during the active vegetative phase of the life-history, as a naked undifferentiated slime or viscous fluid, which throws itself into processes or "pseudopodia" of various form either rapidly changing or relatively constant. Food can be taken into the protoplasm in the form of solid particles at any point of its surface or at any point of a large exposed area. The distinction into so-called "exoplasm" and "endoplasm" recognized by some authors, is not founded on a permanent differentiation of substance corresponding to the cortical and medullary substance of Corticata, but is merely due to the centripetal aggregation of granules lying in a uniform undifferentiated protoplasm. The cell-individual exhibits itself under four phases of growth and development—(1) as a swarm-spore (monadiform young or flagellula); (2) as an amœba form; (3) as constituent of a plasmodium or cell-fusion or conjugation; (4) as a cyst, which may be a flagellula (Schwärme)-producing cyst, an amœbula-producing cyst, a covered-spore (chlamydospore)-producing cyst (sporocyst *sens. stric.*, Zopf), or a simple resting cyst which does not exhibit any fission of its contents (hypocyst). Any one of these phases may be greatly predominant and specialized whilst the others are relatively unimportant and rapidly passed through.

CLASS I. PROTEOMYXA, Lankester.

Characters.—Gymnoxyxa which exhibit in the amœba phase various forms of pseudopodia often changing in the same individual, and do not produce elaborate spore cysts; hence they are not referable to any one of the subsequent six classes. Mostly minute forms, with small inconspicuous nucleus (absent in some?).

A division into orders and families is not desirable, the group being confessedly an assemblage of negatively characterized or insufficiently known forms.

Genera.—*Vampyrella*, Cienkowski (15); *Vampyrellidium*, Zopf (13); *Spirophora*, Zopf (= *Amœba radiosa*, Perty); *Haplococcus*, Zopf; *Leptophrys*, Hertwig and Lesser (16); *Endyomena*, Zopf; *Bursulla*, Sorokin (17); *Myxastrum*, Haeckel (1); *Enteromyxa*, Cienkowski (18); *Colpodella*, Cienkowski (19); *Pseudospora*, Cienkowski (20); *Protomonas*, Cienkowski (15); *Diplophysalis*, Zopf (13); *Gymnococcus*, Zopf; *Aphedidium*, Zopf; *Pseudosporidium*, Zopf; *Protomyxa*, Haeckel (1); *Plasmodiophora*, Woronin (21); *Tetramyxa*, Göbel (22); *Gloidium*, Sorokin (23); *Gymnophrys*, Cienkowski (24); *Myxodictyum*, Haeckel (1); *Boderia*, Wright (25); *Biomyxa*, Leidy (92); *Protogenes*, Haeckel (1); *Protamœba*, Haeckel (1); *Nuclearia*, Cienkowski (26); *Monobia*, Aim. Schneider (27); *Archerina*, Lankester, (14).

The forms here brought together include several genera (the first nineteen) referred by Zopf to the Mycetozoa, some again (*Vampyrella*, *Myxastrum*, *Nuclearia*, *Monobia*) which are by Bütschli associated with the Heliozoa, others (*Protamœba*, *Gloidium*) referred by the same authority to the Lobosa (*Amœbea*) and others (*Colpodella*, *Protomonas*) which might be grouped with the lower Flagellata. By grouping them in the manner here adopted we are enabled to characterize those higher groups more satisfactorily, and to give a just expression to our present want of that knowledge of the life history both of these forms and of the higher Gymnoxyxa which when it is obtained may enable us to disperse this heterogeneous class of Proteomyxa. The group has the same function in relation to the other classes of Gymnoxyxa which the group Vermes has been made to discharge in relation to the better defined phyla of the Metazoa; it is a lumber-room in which obscure, lowly-developed, and insufficiently known forms may be kept until they can be otherwise dealt with.

It is true that, thanks to the researches of Continental botanists (especially Cienkowski and Zopf), we know the life-history of several of these organisms; but we are none the less unable to connect them by tangible characteristics with other Gymnoxyxa.

Nearly all of the above-named genera are parasitic rather than "voracious," that is to say, they feed on the organized products of larger organisms both plants and animals (*Haplococcus* is parasitic in the muscles of the pig), into whose tissues they penetrate, and do not, except in a few cases (*Protomyxa*, *Vampyrella*), engulf whole organisms,

such as Diatoms, etc., in their protoplasm. Many live upon and among the putrefying debris of other organisms (*e.g.*, rotting vegetable stems and leaves, excrements of animals), and like the Mycetozoa exert a digestive action upon the substances with which they come in contact comparable to the putrefying and fermentative activity of the Schizomycetes (*Bacteria*).

Fig. II. illustrates four chief genera of Proteomyxa.

Protomyxa aurantiaca was described by Haeckel (1), who found it on shells of *Spirula* on the coast of the Canary Islands, in the form of orange yellow flakes consisting of branching and reticular protoplasm nourishing itself by the ingestion of Diatoms and Peridinia. This condition is not a simple amœba phase but a "plasmodium" formed by the union of several young amœbæ. The plasmodium under certain conditions draws itself together into a spherical form and secretes a clear membranous cyst around itself, and then breaks up into some hundreds of flagellulæ or swarm-spores (Fig. II. 2). The diameter of the cyst is .12 to .2 millimetre. The flagellulæ subsequently escape (Fig. II. 3) and swim by the vibratile movement of one end which is drawn out in the form of a coarse flagellum. The swarm-spore now passes into the amœba phase (Fig. II. 4). Several of the small amœbæ creeping on the surface of the spirula-shell then unite with one another and form a plasmodium which continues to nourish itself by "voracious" inception of Diatoms and other small organisms. The plasmodia may attain a diameter of one millimetre and be visible by the naked eye.

A nucleus was not observed by Haeckel in the spores nor in the amœba phase, nor scattered nuclei in the plasmodium, but it is not improbable that they exist and escaped detection in the living condition, in consequence of their not being searched for by methods of staining, etc., which have since come into use. A contractile vacuole does not exist.

Vampyrella spirogyra, Cienkowski (Fig. II. 5, 6, 7), is one of several species assigned to the genus *Vampyrella*, all of which feed upon the living cells of plants. The nucleus previously stated to be absent has been detected by Zopf (13). There is no contractile vacuole. The amœba phase has an actinophryd character (*i.e.*, exhibits fine radiating pseudopodia resembling those of the sun-animalcule, *Actinophrys*, one of the Heliozoa). This species feeds exclusively upon the contents of the cells of *Spirogyra*, effecting an entrance through the cell-wall (Fig. II. 5), sucking out the contents, and then creeping on to the next cell. In some species of *Vampyrella* as many as four amœba-individuals have been observed to fuse to form a small plasmodium. Cysts are formed which enclose in this species a single amœba-individual. The cyst often acquires a second or third inner cyst membrane by the shrinking of the protoplasmic body after the first encystment and the subsequent formation of a new membrane. The encysted protoplasm sometimes merely divides into four parts each of which creeps out of the cyst as an Actinophrys-like amœba (Fig. II. 7); in other instances it forms a dense spore, the product of which is not known.

Protogenes primordialis is the name given by Haeckel to a very simple form with radiating filamentous pseudopodia which he observed in sea-water. It appears to be the same organism as that described and figured by Max Schultze as *Amœba porrecta*. Schultze's figure is copied in Fig. II. 12. No nucleus and no contractile vacuole is observed in this form. It feeds voraciously on smaller organisms. Its life-history has not been followed over even a few steps. Hence we must for the present doubt altogether as to its true affinities. Possibly it is only a detached portion of the protoplasm of a larger nucleate Gymnoxyxon. The same kind of doubt is justified in regard to Haeckel's *Protamœba primitiva*, which was observed by him in pond water and differs from *Protogenes* in having lobose pseudopodia, whilst agreeing with it in absence of nuclei, contractile vacuoles, and other differentiation of structure.

The structureless protoplasmic network described by Haeckel from spirit-preserved specimens of Atlantic ooze and identified by him with Huxley's (28) *Bathybius*, as also the similar network described by Bessels (29) as *Protobathybius*, must be regarded for the present as insufficiently known.

It is possible that these appearances observed in the ooze dredged from great depths in the Atlantic are really due to simple Protozoa. On the other hand it has been asserted by Sir Wyville Thomson, who at one time believed in the independent organic nature of *Bathybius*, that the substance taken for protoplasm by both Huxley and Haeckel is in reality a gelatinous precipitate of calcium sulphate thrown down by the action of alcohol upon sea-water. Other naturalists have pointed to the possibility of the protoplasmic network which Bessels studied in the living condition on board ship being detached portions of the protoplasm of

FIG. II.—Various *Proteomyxa*. 1. *Protomyxa aurantiaca*, Haeckel, plasmodium phase. The naked protoplasm shows branched reticulate processes (pseudopodia), and numerous non-contractile vacuoles. It is in the act of engulfing a *Ceratium*. Shells of engulfed *Ciliata* (*Tintinnabula*) are embedded deeply in the protoplasm *a*. 2. Cyst phase of *Protomyxa*. *a*, transparent cyst-wall; *b*, protoplasm broken up into spores. 3. Flagellula phase of *Protomyxa*, the form assumed by the spores on their escape from the cyst. 4. Amœbula phase of the same, the form assumed after a short period by the flagellula. 5. *Vampyrella spirogyrae*, Cienk., amœbula phase penetrating a cell of *Spirogyra* *b*, by a process of its protoplasm *c*, and taking up the substance of the *Spirogyra* cell, some of which is seen within the *Vampyrella* *a*. 6. Large individual of *Vampyrella*, showing pseudopodia *c*, and food particles *a*. The nucleus (though present) is not shown in this drawing. 7. Cyst phase of *Vampyrella*. The contents of the cysts have divided into four equal parts, of which three are visible. One is commencing to break its way through the cyst-wall *f*; *a*, food particles. 8. *Archerina Boltoni*, Lankester, showing lobose and filamentous protoplasm, and three groups of chlorophyll corpuscles. The protoplasm *g* is engulfing a *Bacterium* *i*. 9. Cyst phase of *Archerina*. *a*, spinous cyst-wall; *b*, green-colored contents. 10. Chlorophyll corpuscle of *Archerina* showing tetra-steric division. 11. Actinophryd form of *Archerina*. *b*, chlorophyll corpuscles. 12. *Protogenes primordialis*, Haeckel (*Amœba porrecta*, M. Schultze), from Schultze's figure.

Reticularia and Radiolaria. The matter is one which requires further investigation.

Archerina Boltoni is the name given by Lankester (14) to a very simple *Gymnomyxon* inhabiting fresh-water ponds in company with Desmids and other simple green Algae (Fig. II. 8 to 11). *Archerina* exhibits an amœba phase in which the protoplasm is thrown into long stiff filaments (Fig. II. 11), surrounding a spherical central mass about $\frac{1}{2000}$ th inch in diameter (actinophryd form). A large vacuole (non-contractile) is present, or two or three small ones. No nucleus can be detected by careful use of reagents in this or other phases. The protoplasm has been seen to ingest solid food particles (*Bacteria*) and to assume a lobose form. The most striking characteristic of *Archerina* is the possession of chlorophyll corpuscles. In the actinophryd form two oval green-colored bodies (*b, b*) are seen. As the protoplasm increases by nutrition the chlorophyll corpuscles multiply by quaternary division (Fig. II. 10) and form groups of four or of four sets of four symmetrically arranged. The division of the chlorophyll corpuscles is not necessarily followed by that of the protoplasm, and accordingly specimens are found with many chlorophyll corpuscles embedded in a large growth of protoplasm (Fig. II. 8); the growth may increase to a considerable size, numbering some hundreds of chlorophyll corpuscles, and a proportionate development of protoplasm. Such a growth is not a plasmodium, that is to say, is not formed by fusion of independent amœba forms, but is due to continuous growth. When nutrition fails the individual chlorophyll corpuscles separate, each carrying with it an investment of protoplasm, and then each such amœba form forms a cyst around itself which is covered with short spines (Fig. II. 9). The cysts are not known to give rise to spores, but appear to be merely hypnocyts.

The domination of the protoplasm by the chlorophyll corpuscles is very remarkable and unlike anything known in any other organism. Possibly the chlorophyll corpuscles are to be regarded as nuclei, since it is known that there are distinct points of affinity between the dense protoplasm of ordinary nuclei and the similarly dense protoplasm of normal chlorophyll corpuscles.

CLASS II. MYCETOZOA, De Bary.

Characters—*Gymnomyxa* which, as an exception to all other Protozoa, are not inhabitants of water but occur on damp surfaces exposed to the air. They are never parasitic, as are some of the *Proteomyxa* most nearly allied to them (*Plasmodiophora*, etc.), but feed on organic debris. They are structurally characterized by the fact that the amœba forms, which develop either directly or through flagellulae from their spores, always form large, sometimes very large, *i.e.*, of several square inches area, fusion plasmodia (or rarely aggregation plasmodia), and that the spores are always chlamydospores (*i.e.*, provided with a coat) and are formed either in naked groups of definite shape (*sori*) or on the surface of peculiar columns (*conidiophors*) or in large fruit-like cysts which enclose the whole or a part of the plasmodium and develop besides the spores definite sustentacular structures (*capillitium*) holding the spores in a mesh-work.

Three orders of Mycetozoa are distinguishable according to the arrangement of the spores in more or less complex spore-fruits.

ORDER 1. SOROPHORA, Zopf.

Characters.—Mycetozoa which never exhibit a vibratile (monadiform) swarmspore or flagellula phase, but hatch from the spore as amœbæ. A true fusion plasmodium is not formed, but an aggregation plasmodium by the contact without fusion of numerous amœba forms. The spore fruit is a naked aggregation of definitely arranged encysted amœbæ called a *sorus*, not enclosed in a common capsule; each encysted amœba has the value of a single spore and sets free on germination a single amœbula. They inhabit the dung of various animals.

Genera.—*Copromyxa*, Zopf; *Cynthulina*, Cienk.; *Dictyostelium*, Brefeld; *Acrasis*, Van Tieghem; *Polyspondylium*, Brefeld.

ORDER 2. ENDOSPORA, Zopf.

Characters.—Mycetozoa always passing through the flagellula phase and always forming true plasmodia by fusion of

amoeba forms. The spore-fruit is in the form of a large cyst which encloses a quantity of the plasmodium; the latter then breaks up into (a) spores (one corresponding to each nucleus of the enclosed plasmodium) each of which has a cellulose coat, and (b) a capillitium of threads which hold the spores together. Each spore (chlamydospore) liberates on germination a single nucleated flagellula, which develops into an amoeba, which in turn fuses with other amoebulae to form the plasmodium. The Endosporeae are essentially dwellers on rotten wood and such vegetable refuse.

FIG. III.—Mycetozoa (after De Bary). 1-6, Germination of spore (1) of *Trichea varia*, showing the emerging "flagellula" (4, 5), and its conversion into an "amoeba" (6). 7-18, Series leading from spore to plasmodium phase of *Chondroderma difforme*: 7, spore; 10, flagellula; 12, amoeba; 14, apposition of two amoebulae; 15-17, fusions; 18, Plasmodium; 19, 20, Spore-fruit (cyst) of *Physarum leucophaeum*, Fr. (x 25), the former from the surface, the latter in section with the spores removed to show the sustentacular network or capillitium. 21, Section of the spore-cyst of *Didymium squamulosum*, with the spores removed to show the radiating capillitium x and the stalk.

Sub-order 1. PERITRICHEA, Zopf.

Fam. 1. CLATHROPTYCHIAEAE, Rostafinski.

Genera.—*Clathroptychium*, Rost.; *Enteridium*, Ehr.

Fam. 2. CRIBRARIACEAE.

Genera.—*Dictydium*, Pers.; *Cribraria*, Pers.

Sub-order 2. ENDOTRICHEA, Zopf.

Fam. 1. PHYSAREA.

Genera.—*Physarum*, Pers.; *Craterium*, Trentepol.; *Badhamia*, Berkeley; *Leocarpus*, Link.; *Tilmadoche*, Fr.; *Fuligo* (*Aethalum*), Hall; *Aethaliopsis*, Z.

Fam. 2. DIDYMIACEAE.

Genera.—*Didymium*; *Lepidoderma*, De Bary.

Fam. 3. SPUMARIACEAE.

Genera.—*Spumaria*, Pers.; *Diachea*, Fries.

Fam. 4. STEMONITEA.

Genera.—*Stemonitis*, Gleditsch; *Comatracha*, Preuss; *Lamproderma*, Rost.

Fam. 5. ENERTHENEMEA.

Genera.—*Enertinema*, Bowman.

Fam. 6. RETICULARIACEAE, Zopf.

Genera.—*Amavrochete*, Rost.; *Reticularia*, Bull.

Fam. 7. TRICHINACEAE.

Genera.—*Hemiarcyria*, Rost.; *Trichia*, Hall.

Fam. 8. ARCYRIACEAE.

Genera.—*Arcyria*, Hall; *Cornuvia*, Rost.; *Lycogala*, Ehr.

Fam. 9. PERICHENACEAE.

Genera.—*Perichena*, Fries.; *Lachnobolus*, Fries.

Fam. 10. LICEACEAE.

Genera.—*Licea*, Schrader; *Tubulina*, Pers.; *Lindbladia*, Fries.; *Tubulifera*, Zopf.

ORDER 3. EXOSPOREA, Zopf.

Characters.—The chlamydospore liberates an amoeba in the first instance, which develops into a flagellula. This subsequently returns to the amoeba form and by fusion with other amoebulae it forms a true fusion plasmodium. The spores are not produced within a cyst but upon the surface of column-like up-growths of the plasmodium, each spore (conidium) forming as a little spherical outgrowth attached to the column (conidiophor) by a distinct pedicle.

Sole Genus.—*Ceratiium*. [This name must be changed, since it was already applied to a genus of Dinoflagellata, when Famintzin and Woronin gave it to this Mycetozoon.]

Further Remarks on Mycetozoa.—About two hundred species of Mycetozoa have been described. Botanists, and especially those who occupy themselves with Fungi, have accumulated the very large mass of facts now known in reference to these organisms; nevertheless the most eminent botanist who has done more than any other to advance our knowledge of Mycetozoa, namely, De Bary, has expressed the view that they are to be regarded rather as animals than as plants. The fact is that, once the question is raised, it becomes as reasonable to relegate all the Gymnomyxa without exception to the vegetable kingdom as to do so with the Mycetozoa. Whatever course we take with the latter, we must take also with the Heliozoa, the Radiolaria, and the Reticularia.

The formation of plasmodia, for which the Mycetozoa are conspicuous, appears to be a particular instance of the general phenomenon of cell-conjugation. Small plasmodia are formed by some of the Proteomyxa; but among the other Gymnomyxa, excepting Mycetozoa, and among Corticate Protozoa, the fusion of two individuals (conjugation *sensu stricto*) is more usual than the fusion of several. Zopf (13) has attempted to distinguish arbitrarily between conjugation and plasmodium formation by asserting that in the former the nuclei of the cells which fuse are also fused, whereas in the latter process the nuclei retain their independence. Both statements are questionable. What happens to the nucleus in such conjugations as those of the Gregarina has not yet been made out, whilst it is only quite recently that Strasburger (30) has shown that the plasmodia of Mycetozoa contain numerous scattered nuclei, and it is not known that fusion does not occur between some of these. There is no doubt that the nuclei of plasmodia multiply by fission, though we have no detailed account of the process.

The Sclerophora are exceptional in that the amoeba which unite to form a cell-colony in their case do not actually fuse but only remain in close contact; with this goes the fact that there are no large spore-cysts, but an identification of spore and spore-cyst. The amoebae arrange themselves in stalked clusters (sori), and each becomes encysted: one may, in this case, consider the cyst equally as a spore or as a spore-cyst which produces but a single spore. The amoebae described by various writers as inhabiting the alimentary canal and the dung of higher animals (including man) belong to this group. The form described by Cunningham in the *Quart. Jour. Micr. Sci.*, 1881, as *Protomyxomycetes coprinarius* is apparently related to the *Copromyxa* (*Guttulina*) protea of Fayod (31).

The spore-fruits of the Endosporeae occur in various degrees of elaboration. Usually they are (1) spherical or pear-shaped cysts with or without an obvious stalk (Fig. III. 19, 20, 21), and often have a brilliant color and are of a size readily observed by the naked eye, the plasmodia which give rise to them being by no means microscopic. But they may present themselves (2) as irregular ridges growing up from the plasmodium, when they are termed serpula forms. Lastly, the cysts may be united side by side in larger or smaller groups instead of forming at various separate points of the plasmodium. These composite bodies are termed "fruit-cakes" or "aethalia," in view of the fact that the spore-cysts of *Fuligo*, also called *Aethalum*—the well-known "flowers of tan"—form a cake of this description.

The capillitium or network of threads which lies between the spores in the spore-cysts of Endosporeae is a remarkable structure which exhibits special elaborations in detail in different genera, here not to be noticed for want of space. Although definite in form and structure, these threads are not built up by cells but are formed by a residual protoplasm (*cf.* Sporozoa) which is left in the cyst after the spores have been segregated and enclosed each in its special coat. They are often impregnated by calcium carbonate and exhibit crystalline masses of it, as does also the cyst-wall.

The spores of the Mycetozoa are as a rule about the $\frac{1}{16}$ to $\frac{1}{8}$ inch in diameter. They are produced by millions in the large fruit-cakes of such forms as *Fuligo*. Often the spore-coat is colored; it always consists of a substance which gives the cellulose reaction with iodine and sulphuric acid. This has been sometimes considered an indication of the vegetable nature of the Mycetozoa, but cannot be so regarded since many animals (especially the Tunicata and various Protozoa) produce substances giving this same reaction.

FIG. IV.—Various Lobosa. 1, 2, 3, *Dactylosphaera* (*Amoeba*) *polyopia*, M. Schultze, in three successive stages of division: the changes indicated occupied fifteen minutes. *a*, nucleus; *b*, contractile vacuole (copied from F. E. Schultze, in *Archiv. f. Mikrosk. Anat.*). 4, *Amoeba princeps*, Ehr. (after Auerbach). *a*, nucleus; *b*, *c*, vacuoles (one or more contractile; the shaded granules are food-particles). 5, *Pelomyxa palustris*, Greeff (after Greeff), an example with comparatively few food-particles (natural size $\frac{1}{16}$ inch in length). 6, Portion of a *Pelomyxa* more highly magnified. *a*, clear superficial zone of protoplasm (so-called "exoplasm"); *b*, vacuoles, extremely numerous; *c*, lobose pseudopodium; *d*, a similar pseudopodium; *e*, nuclei; *f*, "refractive bodies" (reproductive?); scattered about in the protoplasm are seen numerous cylindrical crystals. 7, *Arcella vulgaris*, Ehr. *a*, shell; *b*, protoplasm within the shell; *c*, extended protoplasm in the form of lobose pseudopodia; *d*, nuclei; *e*, contractile vacuole; the dark bodies unlettered are gas vacuoles. 8, *Cochliopodium pellucidum*, Hert. and Less. *a*, nucleus surrounded by a hyaline halo sometimes mistaken for the nucleus, whilst the latter is termed nucleolus.

Dryness, low temperature, and want of nutriment lead to a dormant condition of the protoplasm of the plasmodium of many Mycetozoa and to its enclosure in cyst-like growths

known as "sclerotia" which, do not give rise to spores, but from which the protoplasm creeps forth unaltered when temperature, nutrition and moisture are again favorable. The sclerotia are similar in nature to the hypocysts of other Protozoa.

The physiological properties—chemical composition, digestive action, reaction to moisture, heat, light and other physical influences—of the plasmodia of Mycetozoa have been made the subject of important investigations; they furnish the largest masses of undifferentiated protoplasm available for such study. The reader is referred to Zopf's admirable treatise (13) as to these matters and also for a detailed account of the genera and species.

CLASS III. LOBOSA, Carpenter.

Characters.—Gymnomyxa in which (as in the succeeding four classes) the amoeba-phase predominates over the others in permanence, size attained, and, physiological importance. The pseudopodia are lobose, ranging in form from mere wave-like bulgings of the surface to blunt finger-like processes, but never having the character of filaments either simple, arborescent, or reticulate. Fusions of two individuals (conjugation) have been observed in a few cases, but not fusions of many individuals so as to form plasmodia; nevertheless the size attained by the naked protoplasm by pure growth is in some cases considerable, forming masses readily visible by the naked eye (*Pelomyxa*). The presence of more than one nucleus is a frequent character. A contractile vacuole may or may not be present. The formation of sporocysts and of chlamydospores (coated spores) has not been observed in any species, but naked spores (flagellulae or amebulae) have been with more or less certainty observed as the product of the breaking up of some species (*Amoeba*? *Pelomyxa*). The cyst phase is not unusual, but the cyst appears usually to be a hypocyst and not a sporocyst. In the best observed case of spore-production (*Pelomyxa*) the spores were apparently produced without the formation of a cyst. Reproduction is undoubtedly most freely effected by simple fission (*Amoeba*) and by a modified kind of budding (*Arcella*). Fresh-water and marine. Two orders of the Lobosa are distinguished in accordance with the presence or absence of a shell.

ORDER 1. NUDA.

Characters.—Lobosa devoid of a shell.

Genera.—*Amoeba*, Auct. (Fig. IV. 4); *Ourema*, Leidy (with a villous tuft at one end, Wallich's *A. villosa*); *Corycia*, Duj. (low, ridge-like pseudopodia); *Lithamæba*, Lankester (Fig. V.); *Dinamæba*, Leidy (92) (covered with short stiff processes); *Hyalodiscus*, H. and L.; *Plakopus*, F. E. Schultze; *Dactylosphaera*, H. and L. (Fig. IV. 1, 2, 3); *Pelomyxa*, Greeff (Fig. IV. 5, 6); *Amphizonella*, Greeff (forms a gelatinous case which is broken through by the pseudopodia).

ORDER 2. TESTACEA.

Characters.—Lobosa which secrete a shell provided with an aperture from which the naked protoplasm

FIG. V.—*Lithamæba discus*, Lankester, (after Lankester, 34). A, quiescent; B, throwing out pseudopodia. *c*, *v.*, contractile vacuole, overlying which the vacuolated protoplasm is seen; *conc*, concretions insoluble in dilute HCl and dilute KHO, but soluble in strong HCl; *n*, nucleus.

can be protruded. The shell is either soft and membranous, or strengthened by the inclusion of sand particles, or is hard and firm.

Genera.—*Cochliopodium* (Fig. IV. 8), H. and L. *Pyxidicula*,

FIG. VI.—*Labyrinthulidae*. 1. A colony or "cell-heap" of *Labyrinthula vitellina*, Cienk., crawling upon an Alga. 2. A colony or "cell-heap" of *Chlamydomyxa labyrinthuloides*, Archer, with fully expanded network of threads on which the oat-shaped corpuscles (cells) are moving. *o* is an ingested food particle; at *c* a portion of the general protoplasm has detached itself and become encysted. 3. A portion of the network of *Labyrinthula vitellina*, Cienk., more highly magnified. *p*, protoplasmic mass apparently produced by fusion of several filaments; *p'*, fusion of several cells which have lost their definite spindle-shaped contour; *s*, corpuscles which have become spherical and are no longer moving (perhaps about to be encysted). 4. A single spindle cell and threads of *Labyrinthula macrocystis*, Cienk. *n*, nucleus. 5. A group of encysted cells of *L. macrocystis*, embedded in a tough secretion. 6, 7. Encysted cells of *L. macrocystis*, with enclosed protoplasm divided into four spores. 8, 9. Transverse division of a non-encysted spindle-cell of *L. macrocystis*.

Ehr.; *Arcella*, Ehr. (Fig. IV. 7); *Hyalosphenia*, Stein; *Quadrula*, F. E. Schultze (shell membranous, areolated); *Diffugia*, Leclerc (shell with adventitious particles).

Further remarks on the *Lobosa*.—The *Lobosa* do not form

a very numerous nor a very natural assemblage. Undoubtedly some of the forms which have been described as species of *Amœba* are *amœba* forms of *Mycetozoa*; this appears to be most probably the case in parasitic and stercoricolous forms. But when these are removed, as also those *Proteomyxa* which have pseudopodia of varying character, at one time lobose and at another filamentous, we have left a certain small number of independent lobose *Gymno-myxa* which it is most convenient to associate in a separate group. We know very little of the production of spores (whether it actually obtains or not) or of developmental phases among these *Lobosa*. The common *Amœbæ* are referable to the species *A. princeps*, *A. lobosa*, *Dactylosphæra polypodia* *Ouramœba villosa*. Of none of these do we know certainly any reproductive phenomena excepting that of fission (see Fig. IV. 1, 2, 3). Various statements have been made pointing to a peculiar change in the nucleus and a production of spores having the form of minute *Amœbæ*, arising from that body; but they cannot be considered as established. Whilst the observed cases of supposed reproductive phenomena are very few, it must be remembered that we have always to guard (as the history of the *Ciliata* has shown, see below) against the liability to mistake parasitic *amœbulæ* and flagellulæ for the young forms of organisms in which they are merely parasitic. The remarkable *Pelomyxa palustres* of Greeff (32) was seen by him to set free (without forming a cyst) a number of *amœbulæ* which he considers as probably its young. Mr. Weldon of St. John's College, Cambridge, has observed the same phenomenon in specimens of *Pelomyxa* which made their appearance in abundance in an aquarium in the Morphological Laboratory, Cambridge. It seems probable that the *amœbulæ* in this case are not parasites but spore-like young, and this is the best observed case of such reproduction as yet recorded in the group.

Arcella is remarkable for the production of bud-spores which may be considered as a process intermediate between simple fission and the complete breaking up of the parent body into spores. As many as nine globular processes are simultaneously pinched off from the protoplasm extruded from the shell of the *Arcella*; the nuclei (present in the parent *Arcella* to the number of two or three) have not been traced in connection with this process. The buds then become nipped off, and acquire a shell and a contractile vacuole (33).

The presence of more than one nucleus is not unusual in *Lobosa*, and is not due to a fusion of two or more uninuclear individuals, but to a multiplication of the original nucleus. This has been observed in some *Amœbæ* (*A. princeps*?) as well as *Arcella*. *Pelomyxa* (Fig. IV. 6) has a great number of nuclei like the *Heliozoon*, *Actinosphærium* (Fig. VIII.).

Pelomyxa is the most highly differentiated of the *Lobosa*. The highly vacuolated character of its protoplasm is exhibited in a less degree by *Lithamœba* and resembles that of *Heliozoa* and *Radiolaria*. Besides the numerous nuclei there are scattered in the protoplasm strongly refringent bodies (Fig. IV. 6, f), the significance of which has not been ascertained. The superficial protoplasm is free from vacuoles, hyaline, and extremely mobile. Occasionally it is drawn out into very short fine filaments. Scattered in the protoplasm are a number of minute cylindrical crystals, of unascertained composition. *Pelomyxa* is of very large size for Protozoon, attaining a diameter of $\frac{1}{16}$ th of an inch. It takes into its substance a quantity of foreign particles, both nutrient organic matter such as *Rotifera* and *Diatoms* and sand particles. It occurs not uncommonly in old muddy ponds, (such as duck-ponds), creeping upon the bottom, and has a white appearance to the naked eye. *Lithamœba* (Fig. V.), is distinguished by its large size, disk-like form the disk-like shape of its pseudopodia, the presence of specific concretions, the vacuolation of its protoplasm, and the block-like form and peculiar tessellated appearance of its large nucleus, which has a very definite capsule. In *Lithamœba* it is easy to recognize a distinct pellicle or temporary cuticle which is formed upon the surface of the protoplasm, and bursts when a pseudopodium is formed. In fact it is the rupture of this pellicle which appears to be the proximate cause of the outflow of protoplasm as a pseudopodium. Probably a still more delicate pellicle always forms on the surface of naked protoplasm, and in the way just indicated determines by its rupture the form and the direc-

FIG. VII.—*Heliozoa*. 1. *Actinophrys sol*, Ehrb.; $\times 800$. a, food-particle lying in a large food-vacuole; b, deep-lying finely granular protoplasm; c, axial filament of a pseudopodium extended inwards to the nucleus; d, the central nucleus; e, contractile vacuole; f, superficial much-vacuolated protoplasm. 2. *Clathrulina elegans*, Cienk.; $\times 200$. 3. *Heterophrys marina*, H. and L.; $\times 660$. a, nucleus; b, clearer protoplasm surrounding the nucleus; c, the peculiar felted envelope. 4. *Raphidiophrys pallida*, F. E. Schultze; $\times 430$. a, food-particle; b, the nucleus; c, contractile vacuole; d, central granule in which all the axis-filaments of the pseudopodia meet. The tangentially disposed spicules are seen arranged in masses on the surface. 5. *Acanthocystis turfuea*, Carter; $\times 240$. a, probably the central nucleus; b, clear protoplasm around the nucleus; c, more superficial protoplasm with vacuoles and chlorophyll corpuscles; d, coarser silicious spicules; e, finer forked silicious spicules; f, finely granular layer of protoplasm. The long pseudopodia reaching beyond the spicules are not lettered. 6. Bi-flagellate "flagellula" of *Acanthocystis aculeata*. a, nucleus. 7. Ditto of *Clathrulina elegans*. a, nucleus. 8. *Astrodisculus ruber*, Greeff; $\times 320$. a, red-colored central sphere (? nucleus); b, peripheral homogeneous envelope.

tion of the "flow" of protoplasm which is described as the "protrusion" of a pseudopodium.

The shells of Lobosa Testacea are not very complex. That of *Arcella* is remarkable for its hexagonal areolation, dark color, and firm consistence; it consists of a substance resembling chitin. That of *Diffugia* has a delicate membranous basis, but includes foreign particles, so as to resemble the built-up case of a Caddis worm.

Arcella is remarkable among all Protozoa for its power of secreting gas-vacuoles (observed also in an *Amœba* by Bütschli), which serve as a hydrostatic function, causing the *Arcella* to float. The gas can be rapidly absorbed by the protoplasm, when the vacuole necessarily disappears and the *Arcella* sinks.

CLASS IV. LABYRINTHULIDEA.

Characters.—*Gymnomyxa* forming irregular heaps of ovoid nucleated cells, the protoplasm of which extends itself as a branching network or labyrinth of fine threads. The oval (spindle-shaped) corpuscles, consisting of dense protoplasm, and possessing each a well-marked nucleus (not observed in *Chlamydomyxa*), travel regularly and continuously along the network of filaments. The oval corpuscles multiply by fission; they also occasionally become encysted and divide into four spherical spores. The young forms developed from these spores presumably develop into colonies, but have not been observed.

Genera.—Two genera only of Labyrinthulida are known: *Labyrinthula*, Cienkowski; *Chlamydomyxa*, Archer.

Cienkowski (35) discovered *Labyrinthula* on green Algae growing on wooden piles in the harbor of Odessa (marine). It has an orange color and forms patches visible to the naked eye. *Chlamydomyxa* was discovered by Archer of Dublin (36) in the cells of *Sphagnum* and crawling on its surface; hence it is a fresh-water form. Unlike *Labyrinthula*, the latter forms a laminated shell of cellulose (Fig. VI. 2, c), in which it is frequently completely enclosed, and indeed has rarely been seen in the expanded labyrinthine condition. The laminated cellulose shells are very freely secreted, the organism frequently deserting one and forming another within or adherent to that previously occupied. The network of *Chlamydomyxa* appears to consist of hyaline threads of streaming protoplasm, whilst that of *Labyrinthula* has a more horny consistence, and is not regarded by Cienkowski as protoplasm.

The spindle-shaped cells are much alike in form and size in the two genera; but no nucleus was detected by Archer in those of *Chlamydomyxa*. The encysting of the spindle-cells and their fission into spores has been seen only in *Labyrinthula*. *Chlamydomyxa* is often of a brilliant green color owing to the presence of chlorophyll corpuscles, and may exhibit a red or mottled red and green appearance owing to the chemical change of the chlorophyll. It has been observed to take in solid nourishment, though *Labyrinthula* has not.

The Labyrinthulida present strong resemblances to the Mycetoza. The genus *Dactylostelium* (Sorophora) would come very close to *Labyrinthula* were the amœbæ of its aggregation plasmodium set upon a network of threads. Such a network, whether in the condition of soft protoplasm or hardened and horny, is represented in the higher Mycetoza by the capillitium of the sporocysts.

The most important difference between Archer's *Chlamydomyxa* and Cienkowski's *Labyrinthula* is that in the former the threads of the network appear to consist of contractile protoplasm, whilst in the latter they are described as firm horny threads exuded by the spindle-cells. Neither form has been re-examined since its discovery; and it is possible that this apparent difference will be removed by further study.

CLASS V. HELIOZOA, Haeckel, 1866.

Characters.—*Gymnomyxa* in which the dominating amœba phase has the form of a spherical body from the surface of which radiate numerous isolated filamentous pseudopodia which exhibit very little movement or change of form except when engaged in the inception of food-particles. The protoplasm of the spherical body is richly vacuolated; it may exhibit one or more contractile vacuoles and either a single central nucleus or many nuclei (Nuclearia, Actinosphaerium). Skeletal products may or may not be present.

FIG. VIII.—*Heliozoa*. 1. *Actinosphaerium Eichhornii*, Ehr. : $\times 200$. *a*, nuclei; *b*, deeper protoplasm with smaller vacuoles and numerous nuclei; *c*, contractile vacuoles; *d*, peripheral protoplasm with larger vacuoles. 2. A portion of the same specimen more highly magnified and seen in optical section. *a*, nuclei; *b*, deeper protoplasm (so-called endosarc); *d*, peripheral protoplasm (so-called ectosarc); *e*, pseudopodia showing the granular protoplasm streaming over the stiff axial filament; *f*, food-particle in a food-vacuole. 3, 4. Nuclei of *Actinosphaerium* in the resting condition. 5-13. Successive stages in the division of a nucleus of *Actinosphaerium*, showing fibrillation, and in 7 and 8 formation of an equatorial plate of chromatin substance (after Hertwig). 14. Cyst-phase of *Actinosphaerium Eichhornii*, showing the protoplasm divided into twelve chlamydozooids, each of which has a silicious coat; *a*, nucleus of the spore; *g*, gelatinous wall of the cyst; *h*, silicious coat of the spore.

Flagellulae have been observed as the young forms of some species (*Acanthocystis*, *Clathrulina*), but very little has been as yet ascertained as to spore-formation or conjugation in this group, though isolated facts of importance have been observed. Mostly fresh-water forms.

ORDER 1.—APHROTHORACA, Hertwig (56).

Characters.—*Heliozoa* devoid of a spicular or gelatinous envelope, excepting in some a temporary membranous cyst.

Genera.—*Nuclearia*, Cienk. (37) (many nuclei; many contractile vacuoles; body not permanently spherical, but amoeboid); *Actinophrys*, Ehr. (Fig. VII. 1; body spherical; pseudopodia with an axial skeletal filament; central nucleus; one large contractile vacuole; often forming colonies; *A. sol*, the Sun-animalcule); *Actinosphaerium*, Stein (Fig. VIII.; spherical body; pseudopodia with axial filament; nuclei very numerous; contractile vacuoles 2 to 14); *Actinolphus*, F. E. Schulze (stalked).

ORDER 2. CHLAMYDOPHORA, Archer (57).

Characters.—*Heliozoa* with a soft jelly-like or felted fibrous envelope.

Genera.—*Heterophrys*, Archer (Fig. VII. 3); *Sphaenastrum*, Greeff; *Astrodisculus*, Greeff (Fig. VII. 8).

ORDER 3. CHALAROTHORACA, Hertw. and Lesser (58).

Characters.—*Heliozoa* with a loose envelope consisting of isolated silicious spicules.

Genera.—*Raphidiophrys*, Archer (Fig. VII. 4; skeleton in the form of numerous slightly curved spicules placed tangentially in the superficial protoplasm); *Pompholyzophrys*, Archer; *Pinacocystis* H. and L.; *Pinaciophora*, Greeff; *Acanthocystis*, Carter (skeleton in the form of radially disposed silicious needles; encysted condition observed, and flagellula young, Fig. VII. 6); *Wagnerella*, Meresch.

ORDER 4. DESMOTHORACA, Hertw. and Less.

Characters.—*Heliozoa* with a skeletal envelope in the form of a spherical or nearly spherical shell of silica perforated by numerous large holes.

Genera.—*Orbulinella*, Entz (without a stalk); *Clathrulina*, Cienk (with a stalk, Fig. VII. 2).

Further remarks on the Heliozoa.—The Sun-animalcules, *Actinophrys* and *Actinosphaerium*, were the only known members of this group when Carter discovered, in 1863, *Acanthocystis*. Our further knowledge of them is chiefly due to Archer of Dublin, who discovered the most important forms, and figured them in the *Quart. Jour. Micr. Sci.* in 1867.

Some of the *Proteomyxa* (e.g., *Vampyrella*) exhibit "heliozoon-like" or "actinophryd" forms, but are separated from the true *Heliozoa* by the fact that their radiant pseudopodia are not maintained for long in the stiff isolated condition characteristic of this group. It is questionable whether *Nuclearia* should not be relegated to the *Proteomyxa* on account of the mobility of its body, which in all other *Heliozoa* has a constant spherical form.

Actinophrys sol is often seen to form groups or colonies (by fission), and so also is *Raphidiophrys*. It is probable from the little that is known that reproduction takes place not only by simple fission but by multiple fission, producing flagellate spores which may or may not be preceded by encystment. Only *Clathrulina*, *Acanthocystis*, *Actinosphaerium*, and *Actinophrys* have been observed in the encysted state, and only the first two have been credited with the production of flagellated young. The two latter genera form covered spores within their cysts, those

of *Actinosphaerium* being remarkable for their silicious coats (Fig. VIII. 14), but their further development has not been seen.

CLASS VI. RETICULARIA, Carpenter, 1862.

Foraminifera, Auct., *Thalamophora*, Hertwig).

Characters.—*Gymnomyxa* in which the dominating amoebaphase, often of great size (an inch in diameter), has an irregular form, and a tendency to throw out great trunks of branching and often anastomosing filamentous pseudopodia, and an equally strong tendency to form a shell of secreted membrane or secreted lime or of agglutinated sand particles (only in one genus of secreted siliceous into which the Protoplasm (not in all?) can be drawn and out of and over which it usually streams in widely spreading lobes and branches. One nucleus is present, or there are many. A contractile vacuole is sometimes, but not as a rule, present (or at any rate not described). Reproduction is by fission and (as in some other Protozoa) by the forma-

FIG. IX.—Gromiidea (*Reticularia membranosa*). 1. *Diplophrys Archeri*, Barker. a, nucleus; b, contractile vacuoles; c, the yellow oil-like body. Moor pools, Ireland. 2. *Gromia oviformis*, Duj. a, the numerous nuclei; near these the elongated bodies represent ingested Diatoms. Fresh-water. 3. *Shepherdella tenuiformis*, Siddall (*Quart. Jour. Micr. Sci.*, 1880); $\times 30$ diameters. Marine. The protoplasm is retracted at both ends into the tubular case. a, nucleus. 5. *Shepherdella tenuiformis*; $\times 15$; with pseudopodia fully expanded 6-10. Varying appearance of the nucleus as it is carried along in the streaming protoplasm within the tube. 11. *Amphitrema Wrightianum*, Archer, showing membranous shell encrusted with foreign particles. Moor pools, Ireland. 12. *Diaphorophodon mobile*, Archer. a, nucleus. Moor pools, Ireland.

tion of peculiar bud-spores which remain for a time after their formation embedded in the parental protoplasm. No multiple breaking up into spores after or independent of the formation of a cyst is known. Marine and fresh-water.

The Reticularia are divisible into several orders. The marked peculiarity of the shell structure in certain of these orders is only fitly emphasized by grouping them together

as a sub-class Perforata, in contrast to which the remaining orders stand as a sub-class Imperforata. The distinction, however, is not an absolute one, for a few of the Lituolidea are perforate, that is, are sandy isomorphs of perforate genera such as *Globigerina* and *Rotalia*.

SUB-CLASS A. Imperforata.

Characters.—Shell-substance not perforated by numerous apertures through which the protoplasm can issue, but provided with only one or two large apertures, or in branched forms with a few such apertures.

ORDER 1. GROMIIDEA, Brady.

Characters.—Shell or test membranous, in the form of a simple sac with a pseudopodial aperture either at one extremity or at both. Pseudopodia thread-like, long, branching, reticulated. Marine and fresh water.

Fam. 1. MONOSTOMINA, with a single aperture to the shell.

Genera.—*Lieberkuhnia*, Clap. and Lach.; *Gromia*, Duj. (Fig. IX. 2); *Mikrogromia*, Hertw.; *Euglypha*, Duj. (shell built up of hexagonal silicious plates); *Diaphorophodon*, Archer (38) (many foreign particles cemented to form shell; small pseudopodia issue between these, hence resembling Perforata, and large long ones from the proper mouth of the shell, Fig. IX. 12).

Fam. 2. AMPHISTOMINA, with an aperture at each end of the shell.

Genera.—*Diplophrys*, Barker (Fig. IX. 1); *Ditrema*, Archer; *Amphitrema*, Archer (Fig. IX. 11); *Shepherdella*, Siddall (39) (membranous shell very long and cylindrical so as to be actually tubular, narrowed to a spout at each end, Fig. IX. 3; protoplasm extended from either aperture, Fig. IX. 5, and rapidly circulating within the tubular test during life, carrying with it the nucleus which itself exhibits peculiar movements of rotation, Fig. IX. 6, 7, 8, 9, 10).

ORDER 2. ASTRORHIZIDEA, Brady.

Characters.—Test invariably consisting of foreign particles: it is usually of large size and single-chambered, often branched or radiate with a pseudopodial aperture to each branch, the test often continued on to the finer branches of the pseudopodia (Fig. X. 12); never symmetrical. All marine.

Fam. 1. ASTRORHIZINA, Brady. Walls thick, composed of loose sand or mud very slightly cemented.

Genera.—*Astrorhiza*, Sandahl (Fig. X. 12, very little enlarged); *Pelosina*, Brady; *Storthisphaera*, Brady; *Dendrophrya*, St. Wright; *Syringammina*, Brady.

Fam. 2. PILULININA. Test single-chambered; walls thick, composed chiefly of felted sponge-spicules and fine sand, without calcareous or other cement.

Genera.—*Pilulina*, Carpenter; *Technitella*, Norman; *Bathysiphon*, Sars.

Fam. 3. SACCAMMININA. Chambers nearly spherical; walls thin, composed of firmly cemented sand grains.

Genera.—*Psammospheera*, Schultze; *Sorosphaera*, Brady; *Saccammina*, M. Sars.

Fam. 4. RHABDAMMININA. Test composed of firmly cemented sand-grains, often with sponge-spicules intermixed; tubular; straight, radiate, branched or irregular; free or adherent; with one, two, or more apertures; rarely segmented.

Genera.—*Jaculella*, Brady; *Marsipella*, Norman (Fig. X. 13); *Rhabdammina*, M. Sars; *Aschemonella*, Brady; *Rhizammina*, Brady; *Sagenella*, Brady; *Botellina*, Carp.; *Haliphysma* Bowerbank (test wine-glass-shaped, rarely branched, attached by a disk-like base; generally beset with sponge-spicules, Fig. X. 11; pseudopodial aperture at the free extremity). This and *Astrorhiza* are the only members of this order in which the living protoplasm has been observed; in the latter it has the appearance of a yellowish cream, and its microscopic structure is imperfectly known (61). In *Haliphysma* the network of expanded pseudopodia has been observed by Saville Kent as drawn in Fig. X. 11. Lankester (59) discovered numerous vesicular nuclei scattered in the protoplasm (Fig. X. 10, n), and also near the mouth of the shell reproductive bodies (probably bud-spores) embedded in the protoplasm (Fig. X. 8). *Haliphysma* was described by Bowerbank as a Sponge, and mistaken by Haeckel (60) for a very simple two-cell-layered animal (*Enterozoön*), to which he assigned the class name of *Physemaria*.

FIG. X.—Imperforata. 1. *Spiroloculina planulata*, Lamarck, showing five "coils"; porcellaneous. 2. Young ditto, with shell dissolved and protoplasm stained so as to show the seven nuclei *n*. 3. *Spirolina* (*Peneroplis*); a sculptured imperfectly coiled shell; porcellaneous. 4. *Vertebralina*, a simple shell consisting of chambers succeeding one another in a straight line; porcellaneous. 5, 6. *Thurammina papillata*, Brady, a sandy form. 5 is broken open so as to show an inner chamber; recent. $\times 25$. 7. *Lituola* (*Haplophragmium*) *canariensis*, a sandy form; recent. 8. Nucleated reproductive bodies (bud-spores) of *Haliphysema*. 9. *Squammulina laevis*, M. Schultze; $\times 40$; a simple porcellaneous Miliolide. 10. Protoplasmic core removed after treatment with weak chromic acid from the shell of *Haliphysema Tumanovitzii*, Bow. *n*, vesicular nuclei, stained with hæmatoxylin (after Lankester). 11. *Haliphysema Tumanovitzii*; $\times 25$ diam.; living specimen, showing the wine-glass-shaped shell built of sand-grains and sponge-spicules, and the abundant protoplasm *p*, issuing from the mouth of the shell and spreading partly over its projecting constituents. 12. Shell of *Astrohiza limicola*, Sand.; $\times 2$; showing the branches of the test on some of the rays usually broken away in preserved specimens (original). 13. Section of the shell of *Marsipella*, showing thick walls built of sand-grains.

ORDER 3. MILIOLIDEA, Brady.

Characters.—Test imperforate; normally calcareous and

porcellaneous, sometimes encrusted with sand; under starved conditions (e.g., in brackish water) becoming chitinous or chitino-arenaceous; at abyssal depths occasionally consisting of a thin homogeneous imperforate, silicious film. The test has usually a chambered structure, being divided by septa (each with a hole in it) into a series of loculi which may follow one another in a straight line (Fig. X. 4) or the series may be variously coiled (Fig. X. 1 and 3). The chambering of the test does not express a corresponding cell-segmentation of the protoplasm; the latter, although growing in volume as the new shell-chambers are formed, remains one continuous cell-unit with many irregularly scattered nuclei (Fig. X. 2). The chambered and septate structure results in this group and in the other orders from the fact that the protoplasm, expanded beyond the last-formed chamber, forms a new test upon itself whilst it lies and rests upon the surface of the old test. The variations in such a formation are shown in Fig. XII. 1, 2, 3, 4.

Fam. 1. NUBECULARINA. Test free or adherent, taking various irregular asymmetrical forms, with variable aperture or apertures.

Genera.—*Squammulina*, Schultze (Fig. X. 9, showing the expanded pseudopodia); *Nubecularia*, De-france.

Fam. 2. MILIOLINA. Shell coiled on an elongated axis, either symmetrically or in a single plane or inequilaterally; two chambers in each convolution. Shell aperture alternately during growth (addition of new chambers) at either end of the shell.

Genera.—*Biloculina*, D'Orb.; *Fabularia*, De-france; *Spiroloculina*, D'Orb. (Fig. X. 1, 2); *Miliolina*, Williamson (Fig. XI.).

Fam. 3. HAUERININA. Shell dimorphous; chambers partly milioline, partly spiral or rectilinear.

Genera.—*Articulina*, D'Orb.; *Vertebralina*, D'Orb. (Fig. X. 4); *Ophthalmidium*, Kubler; *Hauerina*, D'Orb.; *Planispirina*, Seguenza.

Fam. 4. PENEROPLIDINA. Shell planospiral or cyclical, sometimes crosier-shaped, bilaterally symmetrical.

Genera.—*Cornuspira*, Schultze; *Peneroplis*, Montfort (Fig. X. 3); *Orbiculina*, Lamarck; *Orbitolites*, Lamarck (by a division of the chambers regularly into chamberlets, and a cyclical mode of growth which results in shells of the size of a shilling, a very elaborate-looking structure is produced which has been admirably analyzed by Carpenter (40), to whose memoir the reader is specially referred.

Fam. 5. ALVEOLININA. Shell spiral, elongated in the line of the axis of the convolution; chambers divided into chamberlets.

Genus.—*Alveolina*, D'Orb.

Fam. 6. KERAMOSPHERINA. Shell spherical; chambers in concentric layers.

Genus.—*Keramosphæra*, Brady.

FIG. XI.—*Miliolina* (*Triloculina*) *tenera*. Young living animal with expanded pseudopodia (after Max Schultze). A single nucleus is seen in the innermost chamber.

ORDER 4. LITUOLIDEA, Brady.

Characters.—Test arenaceous, usually regular in contour;

FIG. XII.—Perforata. 1. Spiral arrangement of simple chambers of a Reticularian shell. 2. Ditto, with double septal walls, and supplemental shell-substance (shaded). 3. Diagram to show the mode in which successively-formed chambers may completely embrace their predecessors. 4. Diagram of a simple straight series of non-embracing chambers. 5. *Hastigerina* (*Globigerina*) *Murrayi*, WY. Thompson. a, bubbly (vacuolated) protoplasm, enclosing b, the perforated *Globigerina*-like shell (conf. central capsule of Radiolaria). From the peripheral protoplasm project, not only fine pseudopodia, but hollow spines of calcareous matter, which are set on the shell, and have an axis of active protoplasm. Pelagic; drawn in the living state. 6. *Globigerina bulloides*, D'Orb., showing the punctiform perforations of the shell and the main aperture. 7. Fragment of the shell of *Globigerina*, seen from within, and highly magnified. a, fine perforations in the inner shell substances; b, outer (secondary) shell substance. Two coarser perforations are seen in section, and one lying among the smaller. 8. *Orbulina universa*, D'Orb. Pelagic example, with adherent radiating calcareous spines (hollow), and internally a small *Globigerina* shell. It is uncertain whether *Orbulina* is merely a developmental phase of *Globigerina*. a, *Orbulina* shell; b, *Globigerina* shell. 9. *Polytrema minia-*

ceum, Lin.; $\times 12$. Mediterranean. Example of a branched adherent, calcareous perforate Reticularian. 10. *Calcarina Spengleri*, Gmel.; $\times 10$. Tertiary, Sicily. Shell dissected so as to show the spiral arrangement of the chambers, and the copious secondary shell substance. a², a³, a⁴, chambers of three successive coils in section, showing the thin primary wall (finely tubulate) of each; b, b, b, perforate surfaces of the primary wall of four tiers of chambers, from which the secondary shell substance has been cleared away; c, c, secondary or intermediate shell substance in section, showing coarse canals; d, section of secondary shell substance at right angles to c; e, tubercles of secondary shell substance on the surface; f, f, club-like processes of secondary shell substance.

septation of the many-chambered forms often imperfect, the cavity being labyrinthic. This order consists of sandy isomorphs of the simpler Milioidea, and also of the simpler Perforata (*Lagena*, *Nodosaria*, *Cristellaria*, *Globigerina*, *Rotalia*, *Nonionina*, etc.); it also contains some peculiar adherent species.

Fam. 1. LITUOLINA. Test composed of coarse sand-grains, rough externally; often labyrinthic.

Genera.—*Reophax*, Montfort; *Haplophragmium*, Reuss (Fig. X. 7); *Coskinolina*, Stache; *Placopsilina*, D'Orb.; *Haplostiche*, Reuss; *Lituola*, Lamarck; *Baliodina*, Carter.

Fam. 2. TROCHAMMINA. Test thin, composed of minute sand-grains incorporated with calcareous and other organic cement, or embedded in a chitinous membrane; exterior smooth, often polished; interior smooth or rarely reticulated; never labyrinthic.

Genera.—*Thurammina*, Brady (test consisting typically of a single spherical chamber with several mammillate apertures, Fig. X. 5, 6); *Hippocrepina*, Parker; *Hormosina*, Brady; *Ammodiscus*, Reuss; *Trochammina*, Parker and Jones; *Curterina*, Brady; *Webbina*, D'Orb.

Fam. 3. ENDOTHYRINA. Test more calcareous and less sandy than in the other groups of Lituolidea; sometimes perforate; septation distinct.

Genera.—*Nodosinella*, Brady; *Polyphragma*, Reuss; *Involutina*, Terq.; *Endothyra*, Phillips; *Bradyina*, Möll.; *Stacheia*, Brady.

Fam. 4. LOFTUSINA. Test of relatively large size; lenticular, spherical, or fusiform; constructed either on a spiral plan or in concentric layers, the chamber cavities occupied to a large extent by the excessive development of the finely arenaceous cancellated walls.

Genera.—*Cyclammina*, Brady; *Loftusia*, Brady; *Parkeria*, Carpenter.

SUB-CLASS B. Perforata.

Characters.—Shell substance perforated by numerous minute apertures, through which as well as from the main aperture the protoplasm can issue.

ORDER 5. TEXTULARIDEA, Brady.

Characters.—Tests of the larger species arenaceous, either with or without a perforate calcareous basis; smaller forms hyaline and conspicuously perforated. Chambers arranged in two or more alternating series, or spiral or confused: often dimorphous.

Fam. 1. TEXTULARINA. Typically bi- or tri-serial; often bi-rarely tri-morphous.

Genera.—*Textularia*, DeFrance; *Cuneolina*, D'Orb.; *Verneulina*, D'Orb.; *Tritaxia*, Reuss; *Chrysalidina*, D'Orb.; *Bigenerina*, D'Orb.; *Pavonina*, D'Orb.; *Spiroplecta*, Ehr.; *Gaudryina*, D'Orb.; *Valvulina*, D'Orb.; *Calvulina*, D'Orb.

Fam. 2. BULIMININA. Typically spiral; weaker forms more or less regularly biserial; aperture oblique, comma-shaped or some modification of that form.

Genera.—*Bulimina*, D'Orb.; *Virgulina*, D'Orb.; *Bifarina*, Parker and Jones; *Bolivina*, D'Orb.; *Pleurostomella*, Reuss.

Fam. 3. CASSIDULINA. Test consisting of a Textularia-like series of alternating segments more or less coiled upon itself.

Genera.—*Cassidulina*, D'Orb.; *Ehrenbergina*, Reuss.

ORDER 6. CHILOSTOMELLIDEA, Brady.

Characters.—Test calcareous, finely perforate, many-chambered. Segments following each other from the same end of the long axis, or alternately at the two ends, or in cycles of three, more or less embracing. Aperture a curved slit at the end or margin of the final segment.

Genera.—*Ellipsoidina*, Seguenza; *Chilostomella*, Reuss; *Alloporphina*, Reuss.

ORDER 7. LAGENIDEA, Brady.

Characters.—Test calcareous, very finely perforated; either single-chambered, or consisting of a number of chambers joined in a straight, curved, spiral, alternating, or (rarely) branching series. Aperture simple or radiate, terminal. No interseptal skeleton nor canal system.

Fam. 1. *LAGENINA*. Shell single-chambered.

Genera.—*Lagena*, Walker and Boys; *Nodosaria*, Lamk.; *Lingulina*, D'Orb.; *Fronclularia*, DeFrance; *Rhabdognium*, Reuss; *Margulinula*, D'Orb.; *Vaginulina*, D'Orb.; *Rimulina*, D'Orb.; *Cristellaria*, Lamk.; *Amphicoryne*, Schlumb.; *Lingulinopsis*, Reuss; *Flabellina*, D'Orb.; *Amphimorphina*, Neugeb.; *Dentalinopsis*, Reuss.

Fam. 2. *POLYMORPHININA*. Segments arranged spirally or irregularly around the long axis; rarely biserial and alternate.

Genera.—*Polymorphina*, D'Orb.; *Dimorphina*, D'Orb.; *Uvigerina*, D'Orb.; *Sagrina*, P. and J.

Fam. 3. *RAMULININA*. Shell branching, composed of spherical or pyriform chambers connected by long stoloniferous tubes.

Genus.—*Ramulina*, Rupert Jones.

ORDER 8. GLOBIGERINIDEA, Brady.

Characters.—Test free, calcareous, perforate; chambers few, inflated, arranged spirally; aperture single or multiple, conspicuous. No supplementary skeleton nor canal system. All the larger species pelagic in habit.

Genera.—*Globigerina*, D'Orb. (Fig. XII. 6); *Orbulina*, D'Orb. (Fig. XII. 8); *Hastigerina*, Wy. Thompson (Fig. XII. 5); *Pullenia*, P. and J.; *Sphaeroidina*, D'Orb.; *Candeina*, D'Orb.

ORDER 9. ROTALIDEA, Brady.

Character.—Test calcareous, perforate; free or adherent. Typically spiral and "rotaliform" (Fig. XII. 2), that is to say, coiled in such a manner that the whole of the segments are visible on the superior surface, those of the last convolution only on the inferior or apertural side, sometimes one face being more convex sometimes the other. Aberrant forms evolute, outspread, acervuline, or irregular. Some of the higher modifications with double chamber-walls, supplemental skeleton, and a system of canals. The nature of this supplemental skeleton is shown in Fig. XII. 2 and 10.

Fam. 1. *SPIRILLININA*. Test a complanate, planospiral, non-septate tube; free or attached.

Genus.—*Spirillina*, Ehrh.

Fam. 2. *ROTALINA*. Test spiral, rotaliform, rarely evolute, very rarely irregular or acervuline.

Genera.—*Patellina*, Williamson; *Cymbalopora*, Hay; *Discorbina*, P. and J.; *Planorbulina*, D'Orb.; *Truncatulina*, D'Orb.; *Anomalina*, P. and J.; *Carpenteria*, Gray (adherent); *Rupertia*, Wallick; *Pulvinulina*, P. and J.; *Rotalia*, Lamk.; *Calcarina*, D'Orb. [Shell rotaliform; periphery furnished with radiating spines; supplemental skeleton and canal system largely developed. This form is shown in a dissected condition in Fig. XII. 10. Outside and between the successive chambers with finely perforated walls a^2, a^3, a^4 , a secondary shell-substance is deposited by the protoplasm which has a different structure. Whilst the successive chambers with their finely perforate walls (resembling dentine in structure) are formed by the mass of protoplasm issuing from the mouth of the last-formed chamber, the secondary or supplemental-shell substance is formed by the protoplasm which issues through the fine perforations of the primary shell substance; it is not finely canaliculated, but is of denser substance than the primary shell and traversed by coarse canals (occupied by the protoplasm) which make their way to the surface of the test (c', c''). In *Calcarina* a large bulk of this secondary shell-substance is deposited around each chamber and also forms the heavy club-like spines.]

Fam. 3. *TINOPORINA*. Test consisting of irregularly heaped chambers with (or sometimes without) a more or less distinctly spiral primordial portion; for the most part without any general pseudopodial aperture.

Genera.—*Tinoporus*, Carpenter; *Gypsina*, Carter; *Aphrosina*, Carter; *Thalamopora*, Roemer; *Polytrema*, Risso. [Shell parasitic, encrusting or arborescent; surface areolated, colored pink or white, Fig. XII. 9. Interior partly occupied by small chambers, arranged in more or less regular layers, and partly by non-segmented canal-like spaces, often crowded with sponge-spicules. No true canal system. This is one of the most important types as exhibiting the arborescent and encrusting form of growth. It is fairly abundant.]

ORDER 10. NUMMULINIDEA, Brady.

Characters.—Test calcareous and finely tubulated; typically free, many chambered, and symmetrically spiral. The higher modifications all possess a supplemental skeleton, and canal system of greater or less complexity.

Fam. 1. *FUSILININA*. Shell bilaterally symmetrical; chambers extending from pole to pole; each convolution completely enclosing the previous whorls. Shell-wall finely tubulated. Septa single or rarely double; no true interseptal canals. Aperture a single elongated slit, or a row of small rounded pores, at the inner edge of the final segment.

Genera.—*Fusulina*, Fischer; *Schwagerina*, Möller.

Fam. 2. *POLYSTOMELLINA*. Shell bilaterally symmetrical, nautiloid. Lower forms without supplemental skeleton or interseptal canals; higher types with canals opening at regular intervals along the external septal depressions.

Genera.—*Nonionina*, D'Orb.; *Polystomella*, Lamarck.

Fam. 3. *NUMMULITINA*. Shell lenticular or complanate; lower forms with thickened and finely tubulated shell-wall, but no intermediate skeleton; higher forms with interseptal skeleton and complex canal system.

Genera.—*Archæodiscus*, Brady; *Amphystegina*, D'Orb.; *Operculina*, D'Orb.; *Heterostegina*, D'Orb.; *Nummulites*, Lamarck; *Assilina*, D'Orb.

Fam. 4. *CYCLOCYPEINA*. Shell complanate, with thickened centre or lenticular; consisting of a disk of chambers arranged in concentric annuli, with more or less lateral thickening of laminated shell substance, or acervuline layers of chamberlets. Septa double and furnished with a system of interseptal canals.

Genera.—*Cyclocypeus*, Carpenter; *Orbitoides*, D'Orb.

Fam. 5. *EOZOONINA*. Test forming irregular, adherent, acervuline masses.

Genus.—*Eozoon*, Dawson.

Further Remarks on the Reticularia.—The name *Thalamophora* pointing to the peculiar tendency which the larger members of the group have to form chamber after chamber and so to build up a complex shell, has been proposed by Hertwig (56) and adopted by many writers. The old name *Foraminifera* (which did not refer to the fine perforations of the Perforata but to the large pseudopodial aperture leading from chamber to chamber) has also been extended by some so as to include the simpler *Gromia*-like forms. On the whole Carpenter's term *Reticularia* (62) seems most suitable for the group, since they all present the character indicated. It has been objected that the *Radiolaria* are also reticular in their pseudopodia, but if we except the pelagic forms of *Reticularia* (*Globigerina*, *Orbulina*, etc.), we find that the *Radiolaria* are really distinguishable by their stiffer, straighter, radiating pseudopodia. No doubt the *Labyrinthid Chlamydomyxa* and the plasmodia of some *Mycetozoa* are as reticular in their pseudopodia as the *Reticularia*, but they possess other distinctive features which serve, at any rate in an artificial system, to separate them.

The protoplasm of the majority of the *Reticularia* is unknown, or only very superficially observed; hence we have made a point of introducing among our figures as many as possible, which show this essential part of the organism. It is only recently (1876) that nuclei have been detected in the calcareous-shelled members of the group, and they have only been seen in a few cases.

The protoplasm of the larger shell-making forms is known to be often strongly colored, opaque, and creamy, but its minute structure remains for future investigation. Referring the reader to the figures and their explanation, we would draw especial attention to the structure of the protoplasmic body of *Hastigerina* (one of the *Globigerinidea*) as detected by the "Challenger" naturalists. It will be seen from Fig. XII. 5 that the protoplasm extends as a relatively enormous "bubbly" mass around the shell which is sunk within it; from the surface of this "bubbly" (vacuolated or alveolated) mass the pseudopodia radiate.

The reader is requested to compare this with Fig. XIII., representing the "bubbly" protoplasmic body of *Thalassicola*. It then becomes obvious that the perforated central capsule CK of the latter holds the same relation to the mass of the protoplasm as does the central perforated shell of *Globigerina* (*Hastigerina*). The extreme vacuolation of the protoplasm in both cases (the vacuoles being filled with seawater accumulated by endosmosis) and the stiff radiating pseudopodia are directly correlated with the floating pelagic life of the two organisms. All the *Radiolaria* are pelagic, and many exhibit this vacuolation; only a few of the *Reticularia* are so, and their structural correlation to that habit has only lately been ascertained.

The Reticularia are almost exclusively known by their shells, which offer a most interesting field for study on account of the very great complexity of form attained by some of them, notwithstanding the fact that the animal which produces them is a simple uni-cellular Protozoon. Space does not permit the exposition here of the results obtained by Carpenter in the study of the complex shells of Orbitolites, Operculina, Nummulites, etc.; it is essential that his work *Introduction to the Study of the Foraminifera* (Ray Society, 1862) should be consulted, and in reference to the sandy-shelled forms the monograph by Brady, in the *Challenger Reports*, vol. ix., 1883; and it must be sufficient here to point out the general principles of the shell-architecture of the Reticularia. Let us suppose that we have an ever-growing protoplasmic body which tends to produce a calcareous shell on its surface, leaving an aperture for the exit of its pseudopodia. It will grow too large for its shell and accumulate outside the shell. The accumulated external mass may then secrete a second chamber, resting on the first as chamber 1 rests on chamber 0 in Fig. XII. 4. By further growth a new chamber is necessitated, and so is produced a series following one another in a straight line, each chamber communicating with the newer one in front of it by the narrow pseudopodial aperture (a , a^1 , a^2 , a^3). Now it is possible for these chambers to be very variously arranged instead of simply as in Fig. XII. 4. For instance, each new chamber may completely enclose the last, as in Fig. XII. 3,

FIG. XIII.—*Thalassicoela pelagica*, Haeckel; $\times 25$. CK, central capsule; EP, extracapsular protoplasm; al, alveoli, liquid-holding vacuoles in the protoplasm similar to those of Heliozoa, Pelomyxa, Hastigerina, etc.; ps, pseudopodia. The minute unlettered dots are the "yellow cells."

supposing the protoplasm to spread all over the outside of the old chamber before making a new deposit. Again the chambers need not succeed one another in a straight line, but may be disposed in a spiral (Fig. XII. 1). And this spiral may be a flat coil, or it may be a helicine spiral with a rising axis; further it may be close or open. All these forms in various degrees of elaboration are exhibited by Miliolidea and various Perforata.

But the Perforata in virtue of their perforate shell-walls introduce a new complication. The protoplasm issues not only from the mouth of the last-formed chamber, but from the numerous pores in the wall itself. This latter protoplasm exerts its lime-secreting functions; it gathers itself into coarse branching threads which remain uncalcified, whilst all around a dense deposit of secondary or supplemental shell-substance is thrown down, thus producing a coarsely canalicular structure. The thickness and amount of this secondary shell and the position it may occupy between and around the chambers of primitive shell-substance vary necessarily in different genera according to the mode in which the primitive chambers are arranged and connected with one another. Calcarina is a fairly typical instance of an abundant secondary shell-deposit (Fig. XII. 10), and it is the existence of structure resembling the chambers of Calcarina with their surrounding primary and secondary shell-substances which has rendered it necessary

to regard Eozoon (41) as the metamorphosed encrusting shell of a pre-Cambrian Reticularian.

The division of the Reticularia into Imperforata and Perforata which is here maintained has no longer the significance which was once attributed to it. It appears, according to the researches of Brady, that it is not possible to draw a sharp line between these sub-classes, since there are sandy forms which it is difficult to separate from imperforate Lituolidea and are nevertheless perforate, in fact are "sandy isomorphs of Lagena, Nodosaria, Globigerina, and Rotalia." It does not appear to the present writer that there can be any insurmountable difficulty in separating the Lituolidea into two groups—those which are sandy isomorphs of the porcellaneous Miliolidea, and those which are sandy isomorphs of the hyaline Perforata. The two groups of Lituolidea thus formed might be placed in their natural association respectively with the Imperforata and the Perforata.

The attempt to do this has not been made here, but the classification of Brady has been adopted. In Bütschli's large work on the Protozoa (9) the breaking up of the Lituolidea is carried out to a logical conclusion, and its members dispersed among the Miliolidea on the one hand and the various orders of Perforata on the other hand.

The calcareous shell-substance of the Miliolidea being opaque and white has led to their being called "Porcellana," whilst the transparent calcareous shells of the smaller Perforata has gained for that group the synonym of "Hyalina."

The shells of the calcareous Reticularia and of some of the larger arenaceous forms are found in stratified rocks, from the Palaeozoic strata onwards. The chalk is in places largely composed of their shells, and the Eocene Nummulitic limestone is mainly a cemented mass of the shells of Nummulites often as large each as a shilling. The Atlantic ooze is a chalky deposit consisting largely of the shells of Globigerina, etc.

CLASS VII. **RADIOLARIA**, Haeckel, 1862 (63) (*Polycystina*, Ehr.).

Characters.—Gymnomyxa in which the protoplasmic body of the dominant amœba phase has the form of a sphere or cone from the surface of which radiate filamentous pseudopodia, occasionally anastomosing, and encloses a spherical (homaxonic) or cone-shaped (monaxonic) perforated shell of membranous consistence known as the central capsule, and probably homologous with the perforated shell of a Globigerina. The protoplasm within the capsule (intracapsular protoplasm) is continuous through the pores or apertures of the capsules with the outer protoplasm. Embedded in the former lies the large and specialized nucleus (one or more). Gelatinous substance is frequently formed peripherally by the extracapsular protoplasm, constituting a kind of soft mantle which is penetrated by the pseudopodia. A contractile vacuole is never present.

Usually an abundant skeleton, consisting of spicules of silica or of a peculiar substance called acanthin arranged radially or tangentially, loose or united into a basket work, is present. Oil globules, pigment, and crystals are found in greater or less abundance in the protoplasm.

In most but not all Radiolaria peculiar nucleated yellow corpuscles are abundantly present, usually regarded as parasitic Algae. Reproduction by fission has been observed, and also in some few species a peculiar formation of swarm spores (flagellulæ) within the central capsule, in which the nucleus takes an important part. All the Radiolaria are marine. The Radiolaria are divided into two sub-classes according to the chemical nature of their spicular skeleton, and into orders according to the nature and the disposition of the apertures in the wall of the central capsule.

SUB-CLASS I. **Silica-Skeleta**, Lankester.

Characters.—A more or less elaborate basket-work of tangential and radial elements consisting of secreted silica is present; in rare exceptions no skeleton is developed.

ORDER 1. **PERIPYLÆA**, Hertwig.

Characters.—Silico-skeletal Radiolaria in which the central capsule is uniformly perforated all over by fine pore-canal; its form is that of a sphere (homaxonic), and to this form the silicious skeleton primarily conforms, though it may become discoid, rhomboid, or irregular. The nucleus is usually single, but numerous nuclei are present in each central capsule of the Polycyttaria.

Fam. 1. **SPHÆRIDA**, Haeck. Spherical Peripylæa with a

FIG. XIV.—Radiolaria. 1. Central capsule of *Thalassicola nucleata*, Huxley, in radial section. *a*, the large nucleus (Binnebläschen); *b*, corpuscular structures of the intracapsular protoplasm, containing concretions; *c*, wall of the capsule, (membranous shell), showing the fine radial pore-canals; *d*, nucleolar fibres (chromatin substance) of the nucleus. 2. 3. *Collozoum inerme*, J. Müller, two different forms of colonies, of the natural size. 4. Central capsule from a colony of *Collozoum inerme*, showing the intracapsular protoplasm and nucleus, broken up into a number of spores, the germs of swarm-spores or flagellulae; each encloses a crystalline rod. *c*, yellow cells lying in the extracapsular protoplasm. 5. A small colony of *Collozoum inerme*, magnified 25 diameters. *a*, alveoli (vacuoles) of the extracapsular protoplasm; *b*, central capsules, each containing besides protoplasm a large oil-globule. 6-13. Yellow cells of various Radiolaria: 6, normal yellow cell; 7, 8, division with formation of transverse septum; 9, a modified condition according to Brandt; 10, division of a yellow cell into four; 11, amoeboid condition of a yellow cell from the body of a dead Sphaerozoum; 12, a similar cell in process of division; 13, a yellow cell the protoplasm of which is creeping out of its cellulose envelope. 14. *Heliosphæra inermis*, Haeck., living example; $\times 400$, *a*, nucleus; *b*, central capsule; *c*, silicious basket-work skeleton. 15. Two swarm-spores (flagellulae) of *Collozoum inerme*, set free from such a central capsule as that

drawn in 4; each contains a crystal *b* and a nucleus *a*. 16. Two swarm-spores of *Collozoum inerme*, of the second kind, viz., devoid of crystals, and of two sizes, a macrospore and a microspore. They have been set free from central capsules with contents of a different appearance from that drawn in 4. *a*, nucleus. 17. *Actinomma asteracanthion*, Haeck.; $\times 260$; one of the Peripylæa. Entire animal in optical section. *a*, nucleus; *b*, wall of the central capsule; *c*, innermost silicious shell enclosed in the nucleus; *c*¹, middle shell lying within the central capsule; *c*², outer shell lying in the extracapsular protoplasm. Four radial silicious spines, holding the three spherical shells together are seen. The radial fibrillation of the protoplasm and the fine extracapsular pseudopodia are to be noted. 18. *Amphilonche messanensis*, Haeck.; $\times 200$; one of the Acanthometridea. Entire animal as seen living.

spherical basket-work skeleton, sometimes surrounded by a spongy outer skeleton, sometimes simple, sometimes composed of many concentric spheres (never discoid, flattened, or irregular). The central capsule sometimes encloses a part of the spherical skeleton, and often is penetrated by radiating elements.

Genera (selected).—*Ethmosphæra*, Haeck.; *Xiphosphæra*, Haeck.; *Staurosphæra*, Haeck.; *Heliosphæra*, Haeck. (Fig. XIV. 14); *Astromma*, Haeck.; *Halkomma*, Haeck.; *Actinomma*, Haeck. (Fig. XIV. 17; note the sphere within sphere, the smallest lying in the nucleus, and the whole series of spherical shells connected by radial spines); *Arachnosphæra*, Haeck.; *Plegmosphæra*, Haeck.; *Spongosphæra*, Haeck. (Fig. XVI. 8).

Fam. 2. DISCIDA, Haeck. Discoid Peripylæa; both skeleton and central capsule flattened.

Genera (selected).—*Phæodiscus*, Haeck.; *Heliodiscus*, Haeck.; *Spongodiscus*, Haeck.; *Spongurus*, Haeck.

Fam. 3. THALASSICOLLIDA. Peripylæa devoid of a skeleton, or with a skeleton composed of loose silicious spicules only. Nucleus single; central capsule and general protoplasm spherical.

Genera (selected).—*Thalassicolla*, Huxley (Fig. XIII., Fig. XIV. 1); *Thalassosphæra*, Haeck.; *Physematium*, Haeck.

Fam. 4. POLYCYTTARIA. Peripylæa consisting of colonies of many central capsules united by their extracapsular protoplasm. Central capsules multiplying by fission. Nuclei in each central capsule numerous. Silicious skeleton either absent, or of loose spicules, or having the form of a spherical fenestrated shell surrounding each central capsule.

Genera (selected).—*Collosphæra*, Müller (with fenestrated globular skeleton); *Sphaerozoum*, Haeck., (skeleton of numerous loose spicules which are branched); *Raphidozoum*, Haeck., (spicules simple); *Collozoum*, Müller (devoid of skeleton, Fig. XIV. 2, 3, 4, 5).

ORDER 2. MONOPYLÆA, Hertwig.

Characters.—Silico-skeletal Radiolaria in which the central capsule is not spherical but monaxonic (cone-shaped), with a single perforate area (pore-plate) placed on the basal face of the cone; the membrane of the capsule is simple, the nucleus single; the skeleton is extracapsular, and forms a scaffold-like or bee-hive-like structure of monaxonic form.

Fam. 1. PLECTIDA, Haeck. Skeleton formed of silicious spines loosely conjoined.

Genera (selected).—*Plagiacantha*, Haeck.; *Plegmatium*, Haeck.

Fam. 2. CYRTIDA, Haeck. Skeleton a monaxonic or tri-radiate shell, or continuous piece (bee-hive-shaped).

Genera (selected).—*Halicalyptra*, Haeck.; *Eucyrtidium*, Haeck. (Fig. XV.); *Carpocanium*, Haeck. (Fig. XVI. 3).

Fam. 3. BOTRIDIA, Haeck. Irregular forms; the shell composed of several chambers agglomerated without definite order; a single central capsule.

Genera.—*Botryocyrtis*, Haeck.; *Lithobotrys*, Haeck.

Fam. 4. SPYRIDA, Haeck. Gemminate forms, with shell consisting of two conjoined chambers; a single central capsule.

Fam. 5. STEPHIDA, Haeck. Skeleton cricoid, forming a single silicious ring or several conjoined rings.

Genera (selected).—*Acanthodesmia*, Haeck.; *Zygostephanus*, Haeck.; *Lithocircus*, Haeck. (Fig. XVI. 1).

ORDER 3. PHÆODARIA, Haeck. (*Tripylæa*, Hertwig).

Characters.—Silico-skeletal Radiolaria in which the cen-

tral capsule has a double membrane and more than one perforate area, viz., one chief "polar aperture," and one, two, or more accessory apertures (Fig. XVI. 5). The nucleus is single. Around the central capsule is an abundant dark brown pigment (phæodium of Haeckel). The silicious

FIG. XV.—*Eucyrtidium cranioides*, Haeck.; $\times 150$; one of the Monopylæa. Entire animal as seen in the living condition. The central capsule is hidden by the bee-hive-shaped silicious shell within which it is lodged.

skeleton exhibits various shapes regular and irregular, but is often remarkable for the fact that it is built up of hollow tubes.

Fam. 1. PHÆOCYSTIDA, Haeck. The silicious skeleton is either entirely absent or consists of hollow needles which are disposed outside the central capsule, regularly or irregularly.

Genera (selected).—*Aulacantha*, Haeck.; *Thalassoplancta*, Haeck.

Fam. 2. PHÆOGROMIDA, Haeck. The silicious skeleton consists of a single fenestrated shell, which may be spherical, ovoid, or often dipleuric, but always has one or more large openings.

Genera (selected).—*Challengeria*, Wy. Thomson; *Lithogromia*, Haeck.

Fam. 3. PHÆOSPHERIDA. The silicious skeleton consists of numerous hollow tubes which are united in a peculiar way to form a large spherical or polyhedral basket-work.

Genera (selected).—*Aulosphæra*, Haeck. (Fig. XVI. 9); *Auloplegma*, Haeck.; *Cannacantha*, Haeck.

Fam. 4. PHÆOCONCHIDA. The siliceous skeleton consists of two separate fenestrated valves, similar to a mussel's shells; often there are attached to the valves simple or branched hollow tubes of silice.

Genera (selected).—*Conchidium*, Haeck.; *Cælodendrum*, Haeck. (Fig. XVI. 4).

SUB-CLASS II. Acanthometridea, Lankester (= *Acanthino* *skeleta*).

Characters.—Radiolaria in which the skeleton is composed of a peculiar horny substance known as acanthin (rarely of silica). The central capsule is uniformly perforate (Peripylæa type). A divided or multiple nucleus is present in the capsule; the capsule-wall is single. The skeleton always has the form of spines which radiate from a central point within the capsule where they are all fitted to one another. Rarely a fenestrated tangential skeleton is also formed.

Fam. 1. ACANTHONIDA, Haeck. Skeleton consisting of

twenty spines of acanthin disposed in five parallel zones of four spines each, meeting one another at the central point of the organism; never forming a fenestrated shell.

Genera (selected).—*Acanthometra*, J. Müller (Fig. XVI. 6, 7); *Astrolonche*, Haeck.; *Amphilonche*, Haeck. (Fig. XIV. 18). Fam. 2. DIPLOCONDIA, Haeck. Skeleton a double cone. Genus unicum.—*Diploconus*, Haeck.

Fam. 3. DORATASPIDA, Haeck. The twenty acanthin spines of the skeleton form by transverse outgrowths a spherical fenestrated shell.

Genera (selected).—*Stauraspis*, Haeck.; *Dorataspis*, Haeck.

Fam. 4. SPHÆROCAPSIDA, Haeck. The twenty acanthin spines are joined together at their free apices by a simple perforate shell of acanthin.

Genus unicum.—*Sphærocapsa*.

Fam. 5. LITHOLOPHIDA. Skeleton of many needles of acanthin radiating from a single point without definite number or order.

Genera.—*Litholophus*, Haeck.; *Astrolophus*, Haeck.

Further remarks on the Radiolaria.—It has not been possible in the systematic summary above given to enumerate the immense number of genera which have been distinguished by Haeckel (42) as the result of the study of the skeletons of this group. The important differences in the structure of the central capsule of different Radiolaria were first shown by Hertwig, who also discovered that the spines of the Acanthometridea consist not of silica but of an organic compound. In view of this latter fact and of the peculiar numerical and architectural features of the Acanthometrid skeleton, it seems proper to separate them altogether from the other Radiolaria. The Peripylæa may be regarded as a starting point of the Radiolarian pedigree, and have given rise on the one hand to the Acanthometridea, which retain the archaic structure of the central capsule whilst developing a peculiar skeleton, and on the other hand to the Monopylæa and Phæodaria which have modified the capsule but retained the silicious skeleton.

The occasional total absence of any silicious or acanthino skeleton does not appear to be a matter of classificatory importance, since skeletal elements occur in close allies of those very few forms which are totally devoid of skeleton. Similarly it does not appear to be a matter of great significance that some forms (Polycyttaria) form colonies, instead of the central capsules separating from one another after fission has occurred.

It is important to note that the skeleton of silice or acanthin does not correspond to the shell of other Gymnomyxa, which appears rather to be represented by the membranous central capsule. The skeleton does, however, appear to correspond to the spicules of Heliozoa, and there is an undeniable affinity between such a form as *Clathrulina* (Fig. VII. 2.) and the Sphærid Peripylæa (such as *Heliosphæra*, Fig. XIV. 14). The Radiolaria, are, however, a very strongly marked group, definitely separated from all other Gymnomyxa by the membranous central capsule sunk in their protoplasm. Their differences *inter se* do not affect their essential structure. The variations in the chemical composition of the skeleton and in the perforation of the capsule do not appear superficially. The most obvious features in which they differ from one another relate to the form and complexity of the skeleton, a part of the organism so little characteristic of the group that it may be wanting altogether. It is not known how far the form-species and form-genera which have been distinguished in such profusion by Haeckel as the result of a study of the skeletons are permanent (i.e., relatively permanent) physiological species. There is no doubt that very many are local and conditional varieties of a single Protean species. The same remark applies to the species discriminated among the shell-bearing Reticularia. It must not be supposed, however, that less importance is to be attached to the distinguishing and recording of such forms because we are not able to assert that they are permanent species.

The yellow cells (of spherical form, .005 to 0.15 of a millimetre in diameter) which occur very generally scattered in

plasma); e, peculiar intracapsular yellow cells. 8. *Spongophara streptacantha*, Haeck; one of the Peripyllæa. Silicious skeleton not quite completely drawn on the right side. a, the spherical extracapsular shell (compare Fig. XIV. 17), supporting very large radial spines which are connected by a spongy network of silicious fibres. 9. *Autosphaera elegantissima*, Haeck; one of the Phæodaria. Half of the spherical silicious skeleton.

the extracapsular protoplasm of Radiolaria were at one time regarded as essential components of the Radiolarian body. Their parasitic nature is now rendered probable by the observations of Cienkowski (43), Brandt (44), and Geddes (45), who have established that each cell has a cellulose wall and a nucleus (Fig. XIV. 6 to 13), that the protoplasm is impregnated by chlorophyll which, as in Diatoms, is obscured by the yellow pigment, and that a starch-like substance is present (giving the violet reaction with iodine). Further Cienkowski showed, not only that the yellow cells multiply by fission during the life of the Radiolarian, but that when isolated they continue to live; the cellulose envelope becomes softened; the protoplasm exhibits amoeboid movements and escapes from the envelope altogether (Fig. XIV. 13) and multiplies by fission. Brandt has given the name *Zooxanthella nutricula* to the parasitic unicellular Alga thus indicated. He and Geddes have shown that a similar organism infests the endoderm cells of Anthozoa and of some Siphonophora in enormous quantities, and the former has been led, it seems erroneously, to regard the chlorophyll corpuscles of *Hydra viridis*, Spongilla, and Ciliata as also parasitic Algae, for which he has coined the name *Zoochlorella*. The same arguments which Brandt has used to justify this view as to animal chlorophyll would warrant the creation of a genus "*Phytochlorella*" for the hypothetical Alga which has hitherto been described as the "chlorophyll corpuscles" of the cells of ordinary green plants.

Zooxanthella nutricula does not, for some unknown reason, infest the Acanthometridæ, and it is by no means so universally present in the bodies of the Silico-skeleta as was supposed before its parasitic nature was recognized.

The streaming of the granules of the protoplasm has been observed in the pseudopodia of Radiolaria as in those of Heliozoa and Reticularia; it has also been seen in the deeper protoplasm; and granules have been definitely seen to pass through the pores of the central capsule from the intracapsular to the extracapsular protoplasm. A feeble vibrating movement of the pseudopodia has been occasionally noticed.

The production of swarm-spores has been observed only in Acanthometra and in the Polycyttaria and Thalassicolidæ, and only in the two latter groups have any detailed observations been made. Two distinct processes of swarm-spore production have been observed by Cienkowski (43), confirmed by Hertwig (46)—distinguished by the character of the resulting spores which are called "crystalligerous" (Fig. XIV. 15) in the one case, and "dimorphous" in the other (Fig. XIV. 16). In both processes the nucleated protoplasm within the central capsule breaks up by a more or less regular cell-division into small pieces, the details of the process differing a little in the two cases. In those individuals which produce crystalligerous swarm-spores, each spore encloses a small crystal (Fig. XIV. 15). On the other hand, in those in-

dividuals which produce dimorphous swarm-spores, the contents of the capsule (which in both instances are set free by its natural rupture) are seen to consist of individuals of two sizes "macrospores" and "microspores," neither of which contain crystals (Fig. XIV. 16). The further development of the spores has not been observed in either case. Both processes have been observed in the same species, and it is suggested that there is an alternation of sexual and asexual generations, the crystalligerous spores developing directly into adults, which in their turn produce in their central capsules dimorphous swarm-spores (macrospores and microspores), which in a manner analogous to that observed in the Volvocinean Flagellata copulate (permanently fuse) with one another (the larger with the smaller) before proceeding to develop. The adults resulting from this process would, it is suggested, produce in their turn crystalligerous swarm-spores. Unfortunately we have no observations to support this hypothetical scheme of a life history.

Fusion or conjugation of adult Radiolaria, whether preliminary to swarm-spore-production or independently of it, has not been observed—this affording a distinction between

FIG. XVI.—Radiolaria. 1. *Lithocircus annularis*, Hertwig; one of the Monopylæa. Whole animal in the living state (optical section). a, nucleus; b, wall of the central capsule; c, yellow cells; d, perforated area of the central capsule (Monopylæa). 2. *Cystidium inermis*, Hertwig; one of the Monopylæa. Living animal. An example of a Monopylæon destitute of skeleton. a, nucleus; b, capsule-wall; c, yellow cells in the extracapsular protoplasm. 3. *Carposcantium diadema*, Haeck; optical section of the bee-hive-shaped shell to show the form and position of the protoplasmic body. a, the tri-lobed nucleus; b, the silicious shell; c, oil-globules; d, the perforate area (pore-plate) of the central capsule. 4. *Celodendrum gracillimum*, Haeck; living animal, complete; one of the Tripylæa. a, the characteristic dark pigment (phæodium) surrounding the central capsule b. The peculiar branched silicious skeleton, consisting of hollow fibres, and the expanded pseudopodia are seen. 5. Central capsule of one of the Tripylæa, isolated, showing a, the nucleus; b, c, the inner and the outer laminae of the capsule-wall; d, the chief polar aperture; e, e, the two secondary apertures. 6, 7, *Acanthometra Claparedi*, Haeck. 6 shows the animal in optical section, so as to exhibit the characteristic meeting of the spines at the central point as in all Acanthometridæ; 7 shows the transition from the uninuclear to the multinuclear condition by the breaking up of the large nucleus. a, small nuclei; b, large fragments of the single nucleus; c, wall of the central capsule; d, extracapsular jelly (not proto-

FIG. XVII.—Sporozoa. 1, 2. *Monocystis agilis*, Stein; $\times 250$; from the testis of the Earthworm. Two phases of movement—a ring-like contraction passing along the body from one end to the other. 3. Individual of the same species which has penetrated in the young stage a sperm-cell of the Earthworm, and is now clothed as it were with spermatoblasts. 4. *Monocystis magna*, A. Schmidt, from the testis of the Earthworm (*L. terrestris*, L.). Two individuals, which are implanted by one extremity at *b* in two epithelial cells of the rosette of the spermatic duct. *a*, nucleus of the *Monocystis*. 5. Tailed chlamydospores of *Monocystis senariidis*, Köll. 6. Two *M. agilis* encysted, spores forming on the surface of the protoplasm. 7. A similar cyst further advanced in spore-formation (see Fig. XVIII.). 8. Spore of *M. agilis*, now elongated but still naked. *a*, nucleus. $\times 1400$. 9. The spore has now encased itself in a navicula-shaped coat. *a*, nucleus. 10. The spore protoplasm has now divided into several falciform swarm-spores, leaving a portion of the protoplasm unused. *b*, Schneider's residual core. 11. Optical transverse section of a completed spore. *b*, Schneider's residual core. 12. Chlamydospore of *Klossia chitonis*, nov. sp. from the liver of Chiton (original). 13, 14. Chlamydospore of *Monocystis nemertis*, Köll., liberating falciform young. *b*, Schneider's residue. 15. *Monocystis pellucida*, Köll. (from Nereis); $\times 150$; to

show the very thick cortical substance and its fibrillation (after Lankester, 54). 16. *Monocystis senariidis*, Kölle, two individuals adhering to one another (a szygium). Lankester (55); $\times 60$; remarkable among *Monocystids* for its long proboscis resembling the epimerite of some Septata. 18. *Klossia helicina*, Aim. Schn., from the kidney of *Helix hortensis*. A single cell of the renal epithelium in which a full-grown *Klossia* is embedded. *a*, nucleus of the *Klossia*; *a'*, nucleus of the renal cell. 19. Cyst of *Klossia helicina*, the contents broken up into spherical chlamydospores. 20. Single spore from the last, showing falciform young and a Schneider's residue *b*. 21. The contents of the same spore. 22. A small renal cell of *Helix* containing two of the youngest stage of *Klossia*. 23. *Monocystis sagittata*, Leuck., from the intestine of *Capitella capitata*; $\times 100$. 24 to 31. *Coccidium oviforme*, Leuck., from the liver of the Rabbit: 24, adult individual encysted; 25, the protoplasm contracted—*a*, nucleus; 26, 27, division into four spores, as yet naked; 28, 29, the spores having acquired a covering, i.e., are chlamydospores, and each contains a single falciform young; 30, 31, two views of a chlamydospore more highly magnified so as to show the single falciform young (from Leuckart). 32. *Klossia octopiana*, Aim. Schn., from Cephalopoda. *a*, nucleus; *c*, cyst-membrane. $\times 200$ diam. 33. Single spherical spore of the same; $\times 1400$ diam; showing numerous falciform young, and 12 *b*, Schneider's residue. 34. *Myxidium Lieberkühni*, Bütschli, one of the Myxosporidia, from the bladder of the Pike (Esox); creeping euglena phase, showing strongly lobed amoeboid character (pseudopodia and undifferentiated (?) cortex); $\times 60$ diam. 35-39. *Eimeria falciformis*, Elmer, sp., from the Mouse: 35, an adult non-encysted individual inhabiting an epithelial cell of the intestine of the mouse; 36, encysted phase; 37, clear corpuscles appear in the encysted protoplasm; 38, the protoplasm now forms a single spore containing several falciform young; *b*, Schneider's residue; 39, isolated spore showing falciform young, and *b*, Schneider's residue. 40. Chlamydospore of *Myxobolus Müllerii*, Bütschli; one of the Myxosporidia from the gills of Cyprinoid Fishes. *a*, nucleus; *b*, refringent corpuscle; *c*, polar body or thread capsule. 41. A similar chlamydospore which has ejected the filaments from its thread capsules. 42. Chlamydospore of a Myxosporidium infesting the kidney of *Lota vulgaris*. *c*, polar body (psorosperm of authors). 43, 44. Chlamydospores of a Myxosporidium from the gills of Perca (psorosperm of authors). Compare with the tailed chlamydospores of *Monocystis senariidis*, 5. 45-47. *Drepanidium ranarum*, Lankester, the falciform young of an unascertained Coccidioid infesting the Frog (supposed by Gaule to be produced by the blood corpuscles): 45, specimen stained by iodine; 46, red-blood corpuscle of Frog, showing *b*, two contained *Drepanidia*, and *a*, the nucleus of the blood corpuscle; 47, living *Drepanidium*. 48. Chlamydospore of Lieberkühn's Coccidium of the Frog's kidney, perhaps belonging to the life-cycle of *Drepanidium ranarum*. The spore contains two falciform young (*Drepanidia*?) and a Schneider's residue. 49. Chlamydospore of *Monocystis thalassenz*, Lankester, containing numerous falciform young. 50, 51. *Sarcocystis miescheri*, Lankester: —50, falciform young escaped from chlamydospores; 51, adult euglena phase inhabiting a striated muscle fibre of the Pig.

them and Heliozoa, and an agreement, though of a negative character, with the Reticularia.

Simple fission of the central capsule of adult individuals and subsequently of the whole protoplasmic mass has been observed in several instances, and is probably a general method of reproduction in the group.

The silicious shells of the Radiolaria are found abundantly in certain rocks. They furnish, together with Diatoms and Sponge-spicules, the silica which has been segregated as flint in the chalk formation. They are present in quantity (as much as 10 per cent.) in the Atlantic ooze, and in the celebrated "Barbados earth" (a Tertiary deposit) are the chief components.

GRADE B. CORTICATA, Lankester, 1878 (64).

Characters.—Protozoa in which the protoplasm of the cell-body, in its adult condition, is permanently differentiated into two layers, an outer denser cortical substance and an inner more fluid medullary substance (not to be confused with the merely temporary distinction of exoplasm and endoplasm sometimes noted in Gymnomyxa, which is not structural but due to the gravitation and self-attraction of the coarser granules often embedded in the uniformly fluid protoplasm).

Since the Corticata have developed from simple Gymnomyxa exhibiting both amoeboid and flagellate phases of form and activity, it results (1) that the forms of the body of many Corticata are traceable to modifications of these primitive forms; (2) that the young stages of the Corticata are in the lower classes of that group typical flagellulæ or amoebulæ; and (3) that there are certain archaic forms included in those lower classes whose position there is doubt-

ful, and which might be with almost equal propriety assigned to the *Gymnomyxa*, since they are transitional from that lower grade to the higher grade of *Corticata*.

CLASS I. **SPOROZOA**, Leuckart (47); Syn. *Gregarinida*, Auct.

Characters.—*Corticata* parasitic in almost all classes and orders of animals, imbibing nutriment from the diffusible albuminoids of their hosts and therefore mouthless. In typical cases there is hatched from a chlamydospore one or more modified nucleate or non-nucleate flagellulæ (falciform young, drepanidium phase). The flagellula increases in size and differentiates cortical and medullary substance. Fission is common in the younger stages of growth. The movements now become neither vibratile nor amœboid but definitely restrained, and are best described as "euglenoid" (cf. *Flagellata*, Fig. XX. 27, 28). The nucleus is single, large, and spherical. No contractile vacuole and rarely any vacuole is present. A size of $\frac{1}{16}$ th inch may be attained in this phase, which may be definitely spoken of as the euglena phase corresponding to the amœba phase of *Gymnomyxa*. It is usually of oblong form, with sac-like contractile wall of cortical substance, but may be spherical (*Coccidiidea*) or even amœboid (*Myxosporidia*).

Conjugation, followed directly or after an interval by sporulation, may now ensue. The conjugated individuals (two) or sometimes a single individual, become encysted. The contents of the cysts now rapidly divide (by a process the details of which are unknown) into minute ovoid nucleated (?) bodies; sometimes a portion of the protoplasm is not converted into spores but may form sporoducts (cf. *capillitium* of *Mycetozoa*). Each piece acquires a special chitinous colorless coat, and is then a chlamydospore. Rarely one spore only is formed from the whole contents of a cyst. The spore-coat is usually thick, and remarkable for processes and other accessory developments. The included

from one another according to the form and development attained by the euglena phase. We shall place the most highly developed first, not only because our knowledge about it is most complete, but because it is possible that one at least of the other sub-classes is derived by degeneration from it.

SUB-CLASS I. **Gregarinidea**, Bütschli (9).

Characters.—Sporozoa in which the euglena phase is dominant, being relatively of large size, elongate in form, definitely shaped, having contractile but not viscid cortex, and exhibiting often active nutritional and locomotor phenomena. Though usually if not invariably cell-parasites in early youth, they become free before attaining adult growth, and inhabit either the body-cavity or the intestine of their hosts. Many spores are produced in the encysted phase. The spores have an oblong, sometimes caudate coat, and produce each one or several falciform young. At present only known as parasites of Invertebrata.

ORDER 1. **HAPLOCYTA**, Lankester.

Characters.—Gregarinidea in which there is never at any time a partition of the medullary substance into two or more chambers. The euglenoid is always a single contractile sac with one mass of medullary substance in which floats the large vesicular transparent nucleus. Spores larger than in the next group, each producing several falciform young.

Genus unicum.—*Monocystis*, Stein, 1848. The various generic subdivisions proposed by Aim. Schneider (48), and accepted by Bütschli, appear to the present writer to have insufficient characters, and serve to complicate rather than to organize our knowledge of the subject. We do not yet know enough of the sporulation and subsequent development of the various monocystic Gregarinides to justify the erection of distinct genera.

Monocystis agilis, Stein, Fig. XVII. 1, 2, 3, 6, 7, 8, 9, 10, 11, and Fig. XVIII. is the type. The other species of *Monocystis* occur chiefly (and very commonly) in marine Annelids, Platyhelminthes, Gephyræa, and Tunicata; not in Arthropoda, Mollusca, nor Vertebrata. The only definite differences which they present of possibly more than specific worth, as compared with *M. agilis*, are in the form of the chlamydospores, which are sometimes tailed, as in *M. senuridis* (Fig. XVII. 5), and in *M. nemertis* (Fig. XVII. 13) and *siunculi*, and further also certain differences in the general form, as for instance the anchor-like *M. sagittata* (Fig. XVII. 23), and the probosciferous *M. aphrodite* (Fig. XVII. 17). The fine parallel striation of the cuticle in some species (*M. serpulæ*, etc.) might also be made the basis of a generic or sub-generic group.

On the whole it seems best to leave all the species for the present in the one genus *Monocystis*, pending further knowledge. It seems probable that more than one species (at least two, *M. agilis* and *M. magna*) infest the common Earthworm.

ORDER 2. **SEPTATA**, Lankester.

Characters.—Gregarinidea in which the adult in the medullary substance is separated into two chambers—a smaller anterior (the protomerite) and a larger posterior (the deutomerite), in which lies the nucleus. There is frequently if not always present, either in early growth or more persistently, an anterior proboscis-like appendage (the epimerite) growing from the protomerite. The epimerite serves to attach the parasite to its host, and may for that purpose carry hooklets. It is always shed sooner or later. The phase in which it is present is called a "cephalont," the phase after it has broken off a "sporont" (see Fig. XIX. 22, 23). The spores are smaller than in the preceding group, often very minute, and sometimes the cyst is complicated by the formation of sporoducts, and by a kind of "capillitium" of residual protoplasm (Fig. XIX. 2). Spores producing each only a single (?) falciform young.

Genera.—*Gregarina*, Dufour; *Hoplorhynchus*, Von Carus.

[The numerous genera which have been proposed at different times by Hammerschmidt and others, and more recently by Aimé Schneider, appear to the present writer to be unserviceable, owing to the fact that our knowledge is as yet very incomplete. A good basis for generic or family distinctions might probably be found in the greater or less elaboration of the cyst and the formation or not of sporoducts. But of the majority of Septata we do not know the cysts or the history of sporulation; we merely know that some have simple cysts with complete sporulation leaving

FIG. XVIII.—Cyst of *Monocystis agilis*, the common Gregarinide of the Earthworm; $\times 750$ diam.; showing ripe chlamydospores and complete absence of any residual protoplasm or other material in the cyst (original).

protoplasm of the chlamydospore frequently divides into several pieces before hatching. These usually, when set free from the spore-coat, have the form of modified nucleated flagellulæ, i.e., flagellulæ in which the protoplasm is not drawn out into a thread-like flagellum but exhibits an elongate form, uniformly endowed with vibratile activity. With few (if any) exceptions, the falciform young thus characterized penetrates a cell of some tissue of its host and there undergoes the first stages of its growth (hence called Cytosoa). In some forms the pre-cystic phase never escapes from its cell host. In other cases it remains connected with the hospitable cell long after it has by growth exceeded by many hundred times the bulk of its quondam entertainer: often it loses all connection with its cell host and is carried away to some other part of the infested animal before completing its growth and encysting.

The Sporozoa are divided into four sub-classes, differing

FIG. XIX.—SPOROZOA (SEPTATA). 1. *Gregarina blattarum*, Siebold, from the intestine of *Blatta orientalis*; $\times 80$. A syzygium of two individuals. Each animal consists of a small anterior chamber, the protomerite, and a large posterior chamber, the deutomerite, in which is the nucleus *a*. 2. Over-ripe cyst of *Gregarina blattarum*, with thick gelatinous envelope, *e*, and projecting sporoducts *d*. The spores have been nearly all discharged, but a mass of them still lies in the centre of the cyst *b*. The specimen has been treated with dilute KHO, and the granular contents of the cyst dissolved. Around the central mass of spores is rendered visible the network of protoplasmic origin in which the ejected spores were embedded. This distinctly resembles in origin and function the capillitium of Mycetozoa (Fig. III). *a*, the plasmatic channels leading to the everted sporoducts; *b*, the still remaining spores; *c*, the proper cyst-wall; *d*, the everted sporoducts; *e*, the gelatinous envelope. 3. A ripe spore (chlamydospore) of *Gregarina blattarum*, a long time after its escape from the cyst, $\times 1600$ diam. 4. Commencing encystment of a syzygium *G. blattarum*, *a*, protomerite of one individual; *b*, gelatinous envelope; *c*, protomerite of the second individual. 5. Three epithelial cells of the mid-gut of *Blatta orientalis*, into the end of each of which an extremely young *Gregarina blattarum* has made its way. 6. Further development of the young *Gregarina*; only the epimerite *a* is now buried in the substance of the epithelial

cell, and this will soon break off and set the *Gregarina* free. It is now a "cephalont" it will then become a "sporont." 7. Basal part of an everted sporoduct of *Gregarina blattarum*. *a*, granular-fibrous mass investing the base of the duct; *b*, commencement of the plasmatic channel in the interior of which the sporoduct was produced as an invaginated cuticular formation before its eversion. 8. *Gregarina gigantea*, E. Van Ben., from the intestine of the Lobster; $\times 150$. *a*, nucleus. 9. Anterior end of the same more highly magnified. *a*, protomerite; *b*, layer of circular fibrillae lying below the cuticle; *c*, cortical substance of the deutomerite; *d*, medullary substance of the deutomerite. 10. Two spores of *Gregarina gigantea* (after Bütschli) showing the very thick coat of the spore. 11-15. Stages in the development of *Gregarina gigantea*: 11, recently escaped from the spore-coat, no nucleus; 12, still no nucleus, one vibratile and one motionless process; 13, the two processes have divided; one here drawn has developed a nucleus; 14, further growth; 15, the deutomerite commences to develop. 16. Cysts of *Gregarina gigantea*, from the rectum of the Lobster. The double contents are believed by Ed. Van Beneden to be due not to conjugation previous to encystment but to subsequent fission. 17, 18. *Gregarina longicollis*, Stein, from the intestine of *Blaps mortisaga*: 17, cephalont phase, with a long proboscis-like epimerite *a*, attached to the protomerite *b*; 18, sporont phase, the epimerite having been cast preliminary to syzygy and encystment. 19. *Gregarina Mantieri*, Aim. Schneider, from the intestine of *Timarcha knebriosa*, to show the network of anastomosing fibres beneath the cuticle, similar to the annular fibrillae of *G. gigantea* shown in 9. 20. *Gregarina (Hoplorynchus) obligacanthus*, Stein, from the intestine of the larva of Agrion. Cephalont with spine-crowned epimerite *a*. 21. Spores of *Gregarina obligacanthus*. 22, 23. *Gregarina (Hoplorynchus) Dujardini*, Aim. Schneider, from the intestine of *Lithobius forficatus*: 22, specimen with epimerite *a*, therefore a "cephalont"; 23, specimen losing its epimerite by rupture and becoming a "sporont."

no residue protoplasm, and that others form cysts with double walls and elaborate tubular ducts, whilst a part of the protoplasm is not sporulated but forms a capillitium (Fig. XIX. 2.)

Another possible basis for generic division of the Septata may be found in the characters of the epimerite. This may be present or absent altogether. It may exist only in the young condition or persist until growth is completed. It may be simple, short, elongate, or provided with hooklets. The presence of hooklets on the epimerite is the only character which at present seems to serve conveniently for generic distinction. With regard to the other points mentioned we are not sufficiently informed, since we know the complete history of development from the young form set free from the spore in only one or two cases.]

The Septata are found exclusively in the alimentary canals of Arthropoda (Insects, Myriapods, Crustacea, not Arachnida). See Fig. XIX for various examples of the group.

SUB-CLASS II. COCCIDIIDEA, Bütschli (9).

Sporozoa in which the euglena phase remains of relatively minute size, of spherical shape and simple egg-cell-like structure. It is not locomotive, but continues, until the cyst is formed, to inhabit a single cell of the host. Many, few, or one single chlamydospore are formed in the cyst. One or more falciform young escape from each spore, and exhibit active movements (flagellula-like) leading to a penetration of a tissue-cell by the young form as in Gregarinidea. Many are parasites of Vertebrata.

ORDER 1. MONOSPOREA, Aim. Schn.

Characters.—The whole content of the cyst forms but a single spore,

Genus unicum.—*Eimerii* (in the intestinal epithelium of Triton, Frog, Sparrow, Mouse, and the Myriapods, Lithobius and Glomeris, Fig. XVII. 35 to 39).

ORDER 2. OLIGOSPOREA, Aim. Schn.

Characters.—The cyst-content develops itself into a definite and constant but small number of spores.

Genus unicum.—*Coccidium*, Leuck. (in intestinal epithelium and liver of Mammals, and some Invertebrates, Figs. XVII. 24 to 31).

ORDER 3. POLYSPOREA.

Characters.—The cyst-content develops itself into a great number of spores (sixty or more).

Genus unicum.—*Klossia*, Aim. Schn. Three species of *Klossia* are found in Mollusca—viz., in *Helix*, in *Cephalo-*

pod, and in Chiton. Schneider's genus, *Adelea*, from *Lithobius*, appears to belong here. Kloss (49) discovered the parasite of the renal cells of *Helix hortensis* represented in Fig. XVII. 18, 19, 20, 21, and 22; Schneider that of *Cephalopods*, Fig. XVII. 32, 33. In Chiton Dr. Tovey has discovered a third species with very remarkable spores, which are here figured for the first time (Fig. XVII. 12).

The *Drepanidium Ranarum* (Fig. XVII. 45, 46, 47), discovered by Lankester (50) in the Frog's blood, is probably the falciform young of a Coccidium parasitic in the Frog's kidney, and discovered there by Lieberkühn (51). A spore of this Coccidium is shown in Fig. XVII. 48; whilst in 46 two *Drepanidia* which have penetrated a red-blood corpuscle of the Frog are represented.

The Polysporous Coccidiidea come very close to the Gregarinide genus *Monocystis*, from which they may be considered as being derived by an arrest of development. The spores and falciform young of the Coccidiidea are closely similar to those *Monocystis*, and the young in both cases penetrate the tissue-cells of their host; but in *Monocystis* this is only a temporary condition, and growth leads to the cessation of such "cell-parasitism." On the other hand, growth is arrested in the Coccidiidea, and the organism is permanently a cell-parasite.

Since the parasitism is more developed in the case of a cell-parasite than in the case of a parasite which wanders in the body cavity, it seems probable that the Coccidiidea have been derived from the Gregarinidea rather than that the reverse process has taken place.

SUB-CLASS III. Myxosporidia, Bütschli.

Characters.—Sporozoa in which the euglena-phase is a large multinucleate amoeba-like organism (Fig. XVII. 34). The cysts are imperfectly known, but appear to be simple; some attain a diameter of two lines. The spores are highly characteristic, having each a thick coat which is usually provided with a bifurcate process or may have thread capsules (like nematocysts) in its substance (Fig. XVII. 40, 41, 42, 43, 44).

The spores contain a single nucleus, and are not known to produce falciform young, but in one case have been seen to liberate an amoeba. The further development is unknown. The Myxosporidia are parasitic beneath the epidermis of the gills and fins, and in the gall-bladder and urinary bladder of Fishes, both fresh-water and marine.

Genera.—*Myxidium*, Bütschli (Pike, Fig. XVII. 34); *Myxobolus*, Bütschli (Cyprinoids); *Lithocystis*, Giard (the Lamellibranch *Echinocardium*).

The Myxosporidia are very imperfectly known. They present very close affinities to the Mycetozoa, and are to be regarded as a connecting link between the lower Gymnomyxia and the typical Sporozoa. Possibly their large multinucleate amoeba phase is a plasmodium formed by fusion of amoebulae set free from spores, though it is possible that the many nuclei are the result of a division of an original single nucleus, preparatory to sporulation.

Their spores are more elaborate in structure than those of any other Protozoa, and are more nearly paralleled by those of some species of *Monocystis* than by those of Mycetozoa. The thread capsules of the spores are identical in structure with those of Hydrozoa, and probably serve as organs of attachment, as do the furcate processes of the spore-case. It is not certain that a definite cyst is always or ever formed, but as occurs rarely in some Gregarinidea, the spores may be formed in a non-encysted amoeba form.

Although pseudopodia, sometimes short and thread-like, have been observed in the amoeba phase, yet it is also stated that a distinction of cortical and medullary substance obtains.

The "psorosperms" of J. Müller are the spores of Myxosporidia.

SUB-CLASS IV. Sarcocystidia, Bütschli.

(This division is formed by Bütschli for the reception of *Sarcocystis*, parasitic in the muscular fibres of Mammals, and of *Amoebidium*, parasitic in Crustacea. Both are very insufficiently known, but have the form of tubular protoplasmic bodies in which numerous ovoid spores are formed from which falciform young escape.)

Genera.—*Sarcocystis*, Lankester; *Amoebidium*, Cienkowski (52). *Sarcocystis* (Fig. XVII. 50, 51, *S. Miescheri*, Lankester), was first observed by Miescher in the striated muscle-fibres of the Mouse; then by Rainey in a similar position in the Pig, and taken by him for the youngest stage in the development of the cysts of *Tœnia solium*; subsequently studied by Beale and others in connection with the cattle-plague epidemic, and erroneously supposed to have a causal

connection with that disease. It is common in healthy butcher's meat. See Leuckart. (47).

Further remarks on the Sporozoa.—The Sporozoa contrast strongly with the large classes of Gymnomyxia, the Heliozoa, Reticularia, and Radiolaria, as also with the Ciliate and Tentaculiferous, Corticata, by their abundant and rapidly recurrent formation of spores, and agree in this respect with some *Proteomyxa* with Mycetozoa, and some Flagellata. Their spores are remarkable for the firm, chitin-like spore-coat and its varied shapes, contrasting with the cellulose spherical spore-coat of Mycetozoa and with the naked spores of Radiolaria and Flagellata.

The protoplasm of the more highly developed forms (Gregarinidea) in the euglenoid phase exhibits considerable differentiation. Externally a distinct cuticle may be present, marked by parallel rugæ (*Monocystis serpulae*) or by fine tubercles (*Monocystis sipunculæ*). A circlet of hooks may be formed by the cuticle at one end of the body. Below the cuticle is sometimes developed a layer of fibrils running transversely to the long axis of the body (Fig. XIX. 9 and 19), which have been regarded as contractile, but are probably cuticular. The cortical layer of protoplasm below these cuticular structures is dense and refringent and sometimes fibrillated (*Monocystis pellucida*, Fig. XVII. 15). It is the contractile substance of the organism, and encloses the finely granular more liquid medullary substance. The granules of the latter have been shown by Bütschli (9) to give a starch-like reaction with iodide, etc. Probably the protoplasm in which they lie is finely reticulate or vacuolar, and when the granules are few it is actually seen to be so. No contractile vacuole is ever present. In Myxosporidia the medullary protoplasm is colored yellow by hæmatoïdin derived from the blood of its host or by absorbed bile-pigment, and also contains small crystals.

The nucleus of the gregarinidea is a large clear capsule, with a few or no nucleolar granules. It has never been seen in a state of division, and it is not known what becomes of it during sporulation, though sporulating Gregarinidea have been observed with many minute nuclei scattered in their protoplasm, presumably formed by a breaking up of the single nucleus.

The habit of attaching themselves in pairs which is common in Gregarinidea is perhaps a reminiscence of a more extensive formation of aggregation plasmodia (compare Mycetozoa). The term "syzygium" is applied to such a conjunction of two Gregarinidea; it is not accompanied by fusion of substance. The formation of cysts is not connected with this pairing, since the latter occurs in young individuals long before encystment. Also cysts are formed by single Gregarinidea, as is always the case in the non-motile Coccidiidea.

The encystment always leads to the formation of spores, but in rare cases sporulation has been observed in unencysted Gregarinidea, and it occurs perhaps normally without true cyst-formation in the Myxosporidia.

The cell-parasitism of the young Sporozoa, and their flagellula-like (falciform) young and active vibratile movement, are points indicating affinity with the lower Gymnomyxia, and especially with those *Proteomyxa*, such as *Vampyrella* and *Plasmodiophora*, which are cell-parasites. Indeed it is probable that we have in this fact of cell-parasitism, and especially of parasitism in animal cells, a basis for the theoretical association of several unicellular organisms. The *Haplococcus* of Zopf (regarded by him as a Mycetozoon) is parasitic in the muscular cells of the Pig, and is probably related to *Sarcocystis*. Recently Von Lendenfeld (53) has described in Australia an amoeba-like organism as parasitic in the skin of Sheep, which will probably be found to be either a Sporozoon or referable to those parasitic spore-producing *Proteomyxa* which are separated from Sporozoa only by their negative characters (see previous remarks on the negative characters of *Proteomyxa*).

The application of the name "Gregarines" has sometimes been made erroneously to external parasitic organisms, which have nothing in common with the Sporozoa. This was the case in regard to a fungoid growth in human hair—the so-called "chignon Gregarine." The Silk-worm disease known as "pebrine" has also been attributed to a Gregarine. It seems probable that the parasitic organism which causes that disease is (as is also the distinct parasite causing the disease known as "flaccidezza" in the same animals) one of the Schizomycetes (Bacteria). No disease is known at present as due to Sporozoa, although (*e. g.* the *Klossiachitonis*) they may lead to atrophy of the organs of the animals which they infest, in consequence of their enormous numbers. Coccidia and *Sarcocystis* are stated to occur in Man.

FIG. XX.—Flagellata. 1. *Chlamydomonas pulvisculus*, Ehr. (= *Zigoselmis*, From.). one of the Phytomastigoda; free-swimming individual. *a*, nucleus; *b*, contractile vacuole; *c*, starch corpuscle; *d*, cellulose investment; *e*, stigma (eye-spot). 2. Resting stage of the same, with fourfold division of the cell-contents. Letters as before. 3. Breaking up of the cell-contents into minute biflagellate swarm-spores, which escape, and whose history is not further known. 4. *Synecrypta volvox*, Ehr.; one of the Phytomastigoda. A colony enclosed by a common gelatinous test *a*, stigma; *b*, vacuole (non-contractile). 5. *Uroglena volvox*, Ehr.; one of the Monadidea. Half of large colony, the flagellates embedded in a common jelly. 6. *Chlorogonium enchlorum*, Ehr.; one of the Phytomastigoda. *a*, nucleus; *b*, contractile vacuole; *c*, starch grain; *d*, eye-spot. 7. *Chlorogonium euchlorum*, Ehr.; one of the Phytomastigoda. Copulation of two liberated microgonidia. *a*, nucleus; *b*, contractile vacuole; *d*, eye-spot (so-called). 8. Colony of *Dinobryon sertularia*, Ehr.; $\times 200$; one of the Monadidea. 9. *Hematococcus pultristis*, Gird (= *Chlamydococcus*, Braun, *Protococcus*, Cohn), one of the Phytomastigoda; ordinary individual with widely separated test. *a*, nucleus; *b*, contractile vacuole; *c*, amylo-nucleus (pyrenoid). 10. Dividing resting stage of the same, with eight fission products in the common test *e*. 11. A microgonidium of the same. 12. *Phalansterium consociatum*, Cienk., one of the Choanoflagellata; $\times 325$. Disk-like colony. 13. *Euglena viridis*, Ehr.; $\times 300$; one of the Euglenoidea. *a*, pigment spot

(stigma); *b*, clear space; *c*, paramylum granules; *d*, chromatophor (endochrome plate). 14. *Gonium pectorale*, O. F. Müller; one of the Phytomastigoda. Colony seen from the flat side. $\times 300$. *a*, nucleus; *b*, contractile vacuole; *c*, amylo-nucleus. 15. *Dinobryon sertularia*, Ehr.; one of the Monadidea. *a*, nucleus; *b*, contractile vacuole; *c*, amylo-nucleus; *d*, free colorless flagellates, probably not belonging to *Dinobryon*; *e*, stigma (eye-spot); *f*, chromatophors. 16. *Peranema trichophorum*, Ehr. (one of the Euglenoidea), creeping individual seen from the back; $\times 140$. *a*, nucleus; *b*, contractile vacuoles; *c*, pharynx; *d*, mouth. 17. Anterior end of *Euglena acus*, Ehr., in profile. *a*, mouth; *b*, contractile vacuoles; *c*, pharynx; *d*, stigma (eye-spot); *e*, paramylum-body; *f*, chlorophyll corpuscles. 18. Part of the surface of a colony of *Volvox globator*, L. (Phytomastigoda), showing the intercellular connective fibrils. *a*, nucleus; *b*, contractile vacuole; *c*, amylo-nucleus. 19. Two microgonidia of *Volvox globator*, L. *a*, nucleus; *b*, contractile vacuole. 20. Ripe asexually produced daughter-individual *Volvox minor*, Stein, still enclosed in the cyst of the parthenogonidium. *a*, young parthenogonidia. 21, 22. *Trypanosoma sanguinis*, Gruby; one of the Rhizomastigina, from the blood of *Rana esculenta*. *a*, nucleus. $\times 500$. 23-26. Reproduction of *Bodo caudatus*, Duj. (one of the Heteromastigoda), after Dallinger and Drysdale: 23, fusion of several individuals (plasmodium); 24, encysted fusion-product dividing into four; 25, later into eight; 26, cyst filled with swarm-spores. 27. *Astasia tenax*, O. F. Müll. (Proteus); one of the Euglenoidea; $\times 440$. Individual with the two flagella, and strongly contracting hinder region of the body. *a*, nucleus; *b*, contractile vacuole, close to the pharynx. 28. The same devoid of flagella. *a*, nucleus; *c*, the two dark pigment spots (so-called eyes) near the mouth. 29. *Okomonas termo* (*Monas termo*) Ehr.; one of the Monadidea. *a*, nucleus; *b*, contractile vacuole; *c*, food-ingesting vacuole; *d*, food-particle. $\times 440$. 30. The food particle *d* has now been ingested by the vacuole. 31. *Okomonas multabilis* Kent (Monadidea) with adherent stalk. *a*, nucleus; *b*, contractile vacuole; *c*, food-particle in food vacuole. 32, 33. *Cercomonas crassicauda*, Duj. (Monadidea), showing two conditions of the pseudopodium-protruding tail. *a*, nucleus; *b*, contractile vacuoles; *c*, mouth.

CLASS II. FLAGELLATA,¹ Ehrenberg.

Characters.—Corticata in which the dominant phase in the life-history is a corticate flagellula, that is, a nucleated cell-body provided with one or a few large processes of vibratile protoplasm. Very commonly solid food particles are ingested through a distinct cell-mouth or aperture in the cortical protoplasm, though in some an imbibition of nutritive matter by the whole surface and a nutritional process chemically resembling that of plants (holophytic), chlorophyll being present, seems to occur.

Conjugation followed by a breaking up into very numerous minute naked spores is frequent in some; as also a division into small individuals (microgonidia), which is followed by their conjugation with one another or with big individuals (macrogonidia) and subsequent normal growth and binary fission.

Many have a well-developed cuticle, which may form collar-like outgrowths or stalk-like processes. Many produce either gelatinous or chitin-like shells (cups or conecia), which are connected so as to form spherical or arborescent colonies; in these colonies the protoplasmic organisms themselves produce new individuals by fission, which separate entirely from one another but are held together by the continuity, with those already existing, of the new shells or jelly-houses or stalk-like supports produced by the new individuals. A single well-marked spherical nucleus, and one or more contractile vacuoles, are always present in the full-grown form.

Often, besides ingested food-particles, the protoplasm contains starch granules (amylo-nucleus), paramylum corpuscles, chromatophors and chlorophyll corpuscles, some of which may be so abundant as to obscure the nucleus. One or two pigment spots (stigmata or so-called eye-spots) are often present at the anterior end of the body.

SUB-CLASS I. Lissoflagellata, Lankester.

Never provided with a collar-like outgrowth around the oral pole.

ORDER 1. MONADIDEA, Bütschli.

Characters.—Lissoflagellata of small or very small size and simple structure; often naked and more or less amoeboid, sometimes forming tests. Usually colorless, seldom with chromatophors. With a single anterior large flagellum or sometimes with two additional paraflagella. A special mouth-area is often wanting, sometimes is present, but is never produced into a well-developed pharynx.

¹ Bütschli's work (9) has been pretty closely followed in the diagnosis of the groups of flagellata and the enumeration of genera here given.

Fam. 1. RHIZOMASTIGINA, Bütschli. Simple mouthless forms with 1 to 2 flagella; either permanently exhibiting a Gymnomyxa-like development of pseudopodia or capable of passing suddenly from a firm-walled into a Gymnomyxa-like condition, when the flagella may remain or be drawn in. Ingestion of food by aid of the pseudopodia.

Genera.—*Mastigomæba*, F. E. Schultze; *Ciliophrys*, Cienkowski (65); *Dimorpha*, Gruber; *Actinomonas*, Kent; *Trypansoma*, Gruby (parasitic in the blood of Frogs and other Amphibia and Reptiles, Fig. XX. 21, 22). The Rhizomastigina might all be assigned to the Proteomyxa, with which they closely connect the group of Flagellata. The choice of the position to be assigned to such a form as *Ciliophrys* must be arbitrary.

Fam. 2. CERCOMONADINA, Kent. Minute oblong cell-body which posteriorly may exhibit amoeboid changes. One large anterior flagellum. Mouth at the base of this organ. Reproduction by longitudinal fission and by multiple fission producing spores in the encysted resting state.

Genera.—*Cercomonas*, Duj. (Fig. XX. 32, 33); *Herpetomonas*, S. Kent; *Oikomonas*, Kent (= *Monas*, James Clark; *Pseudospora*, Cienkowski, Fig. XX. 29, 30, 31); *Ancyromonas*, S. K.

Fam. 3. CODONOCINA, Kent. Small colorless monads similar to *Oikomonas* in structure, which secrete a fixed gelatinous or membranous envelope or cup.

Genera.—*Codonæca*, James Clark; *Platyæca*, Stein.

Fam. 4. BIKECINA, Stein. Distinguished from the last family by the fact that the monad is fixed in its cup by a contractile thread-like stalk; cup usually raised on a delicate stalk.

Genera.—*Bicosæca*, J. Cl.; *Poteriodendron*, Stein.

Fam. 5. HETEROMONADINA, Bütschli. Small colorless or green monads which possess, besides one chief flagellum, one or two smaller paraflagella attached near it, often forming colonies secreting a common stalk.

Genera.—*Monas* (Ehr.), Stein; *Dendromonas*, Stein; *Cephalthamium*, Stein; *Anthrophysa*, Bory d. Vinc. (Fig. XXI. 12, 13); *Dinobryon*, Ehr. Fig. XX. 8 and 15); *Epipyxis*, Ehr.; *Uroglena*, Ehr. (Fig. XX. 5.).

ORDER 2. EUGLENOIDEA, Bütschli.

Characters.—Generally somewhat large and highly developed monoflagellate forms, of monaxonic or slightly asymmetrical build. Cuticle present; cortical substance firm, contractile, and elastic; some forms quite stiff, others capable of definite annular contraction and worm-like elongation. At the base of the flagellum a small or large mouth leading into a more or less distinct pharyngeal tube. Near this is always the contractile vacuole. Rarely a pair of flagella instead of one.

Fam. 1. CELOMONADINA. Colored Euglenoidea, with numerous small chlorophyll corpuscles or one to two large plate-like green or brown chromatophors. Mouth and pharynx inconspicuous; nutrition probably largely vegetable (holophytic).

Genera.—*Celomonas*, Stein; *Gonyostomum*, Dies.; *Vacuolaria*, Cienk.; *Microglena*, Ehr.; *Chromulina*, Cienk.; *Cryptoglena*, Ehr.

Fam. 2. EUGLENINA, Stein. Body monaxonic, elongated, hinder end pointed. Spirally striated cuticle. A fine mouth-aperture leads into the well-developed tubular pharynx. Flagellum usually single, sometimes paired, often cast off. Near the pharynx is the "reservoir" of the contractile vacuoles and several of the latter. A single (sometimes two) stigma or color-speck near the same spot. Chromatophors nearly always present, generally bright green. A large nucleus in the middle of the body. Multiplication by longitudinal fission. Encysted condition and attendant fission imperfectly studied. Copulation doubtful.

Genera.—(a) With flexible cuticle: *Euglena*, Ehr. (Fig. XX. 13, 17; this is probably Priestley's "green matter," from which he obtained oxygen gas; though one of the very commonest of all Protozoa, its life-history has yet to be worked out); *Colacium*, Ehr.; *Eutreptia*, Perty.

(b) With stiff, shell-like cuticle: *Ascoglena*, Stein; *Trachelomonas*, Ehr.; *Lepocinclis*, Perty; *Phacus*, Nitzsch.

Fam. 3. MENOIDINA, Bütschli. Similar to the Euglenina, but devoid of chlorophyll, a deficiency connected with the saprophytic mode of life. Stigma always absent.

Genera.—(a) With flexible cuticle: *Astasiopsis*, Bütschli; *Astasiodes*, Bütschli.

(b) With stiff cuticle and non-contractile body: *Monoidium*, Perty; *Atractonema*, Stein; *Rhabdomonas*, Fresenius.

Fam. 4. PERANEMINA. Very contractile (metabolic) colorless Euglenoids. Mouth and pharynx large; inception of solid nutriment certainly observed.

Genera.—*Peranema*, Duj. (Fig. XX. 16); *Urceolus*, Meresch.

Fam. 5. PETALOMONADINA. Colorless, non-metabolic

forms. Mouth opening at the base of the single large flagellum.

Genera.—*Petalomonas*, Stein.

Fam. 6. ASTASINA. Colorless, metabolic, or stiff Euglenoids, differing from the rest in having a small or large paraflagellum in addition to the chief one. Nutrition partly saprophytic partly animal.

Genera.—*Astasia*, Ehr. emend. Stein (Fig. XX. 27, 28); *Heteronema*, Duj.; *Zygoselmis*, Duj.; *Sphenomonas*, Stein; *Tropidoscyphus*, Stein.

ORDER 3. HETEROMASTIGODA, Bütschli.

Characters.—Small and large monads. Naked and even amoeboid or with stiff cuticle. Two flagella at the anterior end differing in size: the smaller directed forwards subserves the usual locomotor function; the larger is directed backwards and trailed, without movement. Sometimes two backwardly directed flagella are present. Always a mouth and animal nutrition. Always colorless.

Fam. 1. BODONINA, Bütschli. Size of the two flagella not very different.

Genera.—*Bodo*, Ehb. emend. Stein (Fig. XX. 23 to 26, and Fig. XXI. 10; the hooked monad and the springing monad of Dallinger and Drysdale (66); *Heteromita* of Dujardin and Kent); *Phyllomitris*, Stein; *Colponema*, Stein; *Dallingeria*, Kent; *Trimastix*, Kent.

Fam. 2. ANISONEMINA, Kent. Large forms with cuticle; difference of the two flagella considerable. Mouth, pharynx, and animal nutrition.

Genera.—*Anisonema*, Duj.; *Entosiphon*, Stein.

ORDER 4. ISOMASTIGODA, Bütschli.

Characters.—Small and middle-sized forms of monaxonic rarely bilateral shape. Fore-end with 2, 4, or seldom 5 equal-sized and similar flagella. Some are colored, some colorless; naked or with strong cuticle or secreting an envelope. Mouth and pharynx seldom observed; nutrition generally holophytic (i.e., like a green plant), but in some cases, nevertheless, holozoic (i.e., like a typical animal).

Fam. 1. AMPHIMONADINA. Small, colorless, biflagellate Isomastigoda.

Genera.—*Amphimonas*, Duj. (? *Pseudospora*, Cienk.).

Fam. 2. SPONGOMONADINA, Stein. Small colorless oval forms with two closely contiguous flagella. Chief character in the union of numerous individuals in a common jelly or in branched gelatinous tubes, the end of each of which is inhabited by a single and distinct individual.

Genera.—*Spongomonas*, Stein; *Cladomonas*, Stein; *Rhipidomonas*, Stein.

[Group *Phytomastigoda*, Bütschli. The following three families, viz., *Chrysomonadina*, *Chlamydomonadina*, and *Volvocina*, are so closely related to one another as to warrant their union as a sub-order. They are typical Isomastigoda, but have chlorophyll corpuscles and holophytic nutrition, with correlated deficient mouth and pharynx. They are usually regarded by botanists as belonging to the unicellular Algæ.]

Fam. 3. CHRYSOMONADINA, Bütschli. Single or colony forming; seldom an envelope. Spherical free-swimming colonies may be formed by grouping of numerous individuals around a centre. With two or rarely one brown or greenish brown chromatophor; a stigma (eye-speck) at the base of the flagella.

Genera.—*Stylochrysalis*, Stein; *Chrysopyxis*, Stein; *Nephroselmis*, Stein; *Synura*, Ehr.; *Syncrypta*, Ehr. (Fig. XX. 4).

Fam. 4. CHLAMYDOMONADINA. Fore-end of the body with two or four (seldom five) flagella. Almost always green in consequence of the presence of a very large single chromatophor. Generally a delicate shell-like envelope of membranous consistence. 1 to 2 contractile vacuoles at the base of the flagella. Usually one eye-speck. Division of the protoplasm within the envelope may produce four, eight, or more new individuals. This may occur in the swimming or in a resting stage. Also by more continuous fission microgonidia of various sizes are formed. Copulation is frequent.

Genera.—*Hymenomonas*, Stein; *Chlorangium*, Stein; *Chlorogonium*, Ehr. (Fig. XX. 6, 7); *Polytoma*, Ehr.; *Chlamydomonas*, Ehr. (Fig. XX. 1, 2, 3); *Hæmatococcus*, Agardh (= *Chlamydococcus*, A. Braun, Stein; *Protococcus*, Cohn, Huxley, and Martin; *Chlamydomonas*, Cienkowski); *Carteria*, Diesing; *Spondylomorum*, Ehr.; *Coccomonas*, Stein; *Phacotus*, Perty.

Fam. 5. VOLVOCINA. Colony-building Phytomastigoda, the cell-individuals standing in structure between *Chlamydomonas* and *Hæmatococcus*, and always biflagellate. The number of individuals united to form a colony varies very much, as does the shape of the colony. Reproduction by the continuous division of all or of only certain individuals of the colony, resulting in the production of a daughter colony

FIG. XXI.—Flagellata. 1. *Salpingoeca fusiformis*, S. Kent; one of the Choanoflagellata. The protoplasmic body is drawn together within the goblet-shaped shell, and divided into numerous spores. $\times 1500$. 2. Escape of the spores of the same as monoflagellata and swarm-spores. 3. *Codosiga umbellata*, Tatem; one of the Choanoflagellata; adult colony formed by dichotomous growth; $\times 625$. 4. A single zooid of the same; $\times 1250$. a, nucleus; b, contractile vacuole; c, the characteristic "collar" formed by cuticle on the inner face of which is a most delicate network of naked streaming protoplasm. 5. *Hexamita inflata*, Duj.; one of the Isomastigoda; $\times 650$; normal adult, showing a, nucleus, and b, contractile vacuole. 6, 7. *Salpingoeca urecolata*, S. Kent; one of the Choanoflagellata; —6, with collar extended; 7, with collar retracted within the stalked cup. a, nucleus; b, contractile vacuole. 8. *Polytoma uvella*, Müll. sp.; one of the Phytomastigoda. a, nucleus; b, contractile vacuole. $\times 800$. 9. *Lophomonas blattarum*, Stein; one of the Isomastigoda, from the intestine of *Blatta orientalis*. a, nucleus. 10. *Bodo lens*, Müll.; one of the Heteromastigoda; $\times 800$. a, nucleus; b, contractile vacuole; the wavy filament is a flagellum, the straight one is an immobile trailing thread. 11. *Tetramitus sulcatus*, Stein; one of the Isomastigoda; $\times 430$. a, nucleus; b, contractile vacuole. 12. *Anthophysa vegelans*, O. F. Müller; one of the Monadidea; $\times 300$. A typical, erect, shortly-branched

ing colony stock with four terminal monad-clusters. 13. Monad cluster of the same in optical section ($\times 800$), showing the relation of the individual monads or flagellate zooids to the stem a. 14. *Tetramitus rostratus*, Perty; one of the Isomastigoda; $\times 1000$. a, nucleus; b, contractile vacuole. 15. *Proterospongia Haeckelii*, Saville Kent; one of the Choanoflagellata; $\times 800$. A social colony of about forty flagellate zooids. a, nucleus; b, contractile vacuole; c, amoebiform zooid sunk within the common jelly or test (compared by S. Kent to the mesoderm-cells of a sponge colony); d, similar zooid multiplying by transverse fission; e, normal zooids with their collars contracted; f, hyaline mucilaginous common test or zoothecium; g, individual contracted and dividing into minute flagellate spores (microgonidia) comparable to the spermatozoa of a Sponge.

(from each such individual). In some, probably in all, at certain times copulation of the individuals of distinct sexual colonies takes place, without or with a differentiation of the colonies and of the copulating cells as male and female. The result of the copulation is a resting zygospore (also called zygote or oo-spermospore or fertilized egg-cell), which after a time develops itself into one or more new colonies.

Genera.—*Gonium*, O. F. Müller (Fig. XX. 14); *Stephanosphæra*, Cohn; *Pandorina*, Bory de Vinc.; *Eudorina*, Ehr.; *Volvox*, Ehr. (Fig. XX. 18, 20).

[The sexual reproduction of the colonies of the Volvocina is one of the most important phenomena presented by the Protozoa. In some families of Flagellata full-grown individuals become amoeboid, fuse, encyst, and then break up into flagellate spores which develop simply to the parental form (Fig. XX. 23 to 26). In the Chlamydomonadina a single adult individual by division produces small individuals, so-called "microgonidia." These copulate with one another or with similar microgonidia formed by other adults (as in *Chlorogonium*, Fig. XX. 7); or more rarely in certain genera a microgonidium copulates with an ordinary individual (macrogonidium). The result in either case is a "zygote," a cell formed by fusion of two which divides in the usual way to produce new individuals. The microgonidium in this case is the male element and equivalent to a spermatozoon; the macrogonidium is the female and equivalent to an egg-cell. The zygote is a fertilized egg-cell, or oo-spermospore. In the colony-building forms we find that only certain cells produce by division microgonidia; and, regarding the colony as a multicellular individual, we may consider these cells as testis-cells and their microgonidia as spermatozoa. In some colony-building forms the microgonidia copulate with ordinary cells of the colony which, when thus fertilized, become encysted as zygotes, and subsequently separate and develop by division into new colonies. In *Volvox* the macrogonidia are also specially-formed cells (not merely any of the ordinary vegetative cells), so that in a sexually ripe colony we can distinguish egg-cells as well as sperm mother-cells. Not only so, but in some instances (*Eudorina* and some species of *Volvox*) the colonies which produce sexual cells can not merely be distinguished from the asexual colonies (which reproduce parthenogenetically), but can be distinguished also *inter se* into male colonies, which produce from certain of their constituent cell-units spermatozoa or microgonidia only, and female colonies which produce no male cells, but only macrogonidia or egg-cells which are destined to be fertilized by the microgonidia or spermatozoa of the male colonies.]

The differentiation of the cell-units of the colony into neutral or merely carrying cells of the general body on the one hand and special sexual cells on the other is extremely important. It places these cell-colonies on a level with the Enterozoa (Metazoa) in regard to reproduction, and it cannot be doubted that the same process of specialization of the reproductive function, at first common to all the cells of the cell-complex, has gone on in both cases. The perishable body which carries the reproductive cells is nevertheless essentially different in the two cases, in the Volvocina being composed of equipollent units, in the Enterozoa being composed of units distributed in two physiologically and morphologically distinct layers or tissues, the ectoderm and the endoderm.

The sexual reproduction of the Vorticellidæ may be instructively compared with that of the Phytomastigoda; see below.]

Fam. 6. TETRAMITINA. Symmetrical, naked, colorless, somewhat amoeboid forms, with four flagella or three and an undulating membrane. Nutrition animal, but mouth rarely seen.

Genera.—*Collodictyon*, Carter; *Tetramitus*, Perty (Fig. XXI.

11, 14; calycine monad of Dallinger and Drysdale (66); *Monocercomonas*, Grassi; *Trichomonas*, Donné; *Trichomastix*, Blochmann.

Fam. 7. POLYMASTIGINA. Small, colorless, symmetrical forms. Two flagella at the hinder end of the body and two or three on each side in front. Nutrition animal or saprophytic.

Genera.—*Hexamitus*, Duj. (Fig. XXI. 5); *Megastoma*, Grassi; *Polymastix*, Bütschli.

Fam. 8. TREPOMONADINA, Kent. As Polymastigina, but the lateral anterior flagella are placed far back on the sides.

Genera.—*Trepomonas*, Duj., described recently without name by Dallinger (67).

Fam. 9. CRYPTOMONADINA. Colored or colorless, laterally compressed, asymmetrical forms; with two very long anterior flagella, placed a little on one side springing from a deep atrium-like groove or furrow (cf. Dinoflagellata and Noctiluca, to which these forms lead).

Genera.—*Cyathomonas*, From.; *Chilomonas*, Ehr.; *Cryptomonas*, Ehr.; *Oxyrrhis*, Duj.

Fam. 10. LOPHOMONADINA. A tuft of numerous flagella anteriorly.

Genus.—*Lophomonas*, Stein (Fig. XXI. 9, connects the Flagellata with the Peritrichous Ciliata).

SUB-CLASS II. Choanoflagellata, Saville Kent.

Flagellata provided with an upstanding collar surrounding the anterior pole of the cell from which the single flagellum springs, identical in essential structure with the "collared cells" of Sponges. Single or colony-building. Individuals naked (*Codosiga*), or inhabiting each a cup (*Salpingoeca*), or embedded in a gelatinous common investment (*Proterospongia*).

ORDER 1. NUDA, Lankester.

Characters.—Individuals naked, secreting neither a lorica (cup) nor a gelatinous envelope.

Genera.—*Monosiga*, S. Kent (solitary stalked or sessile); *Codosiga*, James Clark (united socially on a common stalk or pedicle, Fig. XXI. 3, 4); *Astrosiga*, S. Kent; *Desmarella*, S. Kent.

ORDER 2. LORICATA, Lankester.

Characters.—Each individual collared-cell unit secretes a horny cup or shell.

Genera.—*Salpingoeca*, James Clark (sedentary, Fig. XXI. 6, 7); *Lagenoeca*, S. Kent (free swimming); *Polyoeca*, S. Kent (cups united socially to form a branching zoecium as in Dinobryon).

ORDER 3. GELATINIGERA, Lankester.

The cell-units secrete a copious gelatinous investment and form large colonies.

Genera.—*Phalansterium*, Cienk. (Fig. XX. 12); *Proterospongia*, Saville Kent (Fig. XXI. 15).

[The Choanoflagellata were practically discovered by the American naturalist James Clark (68), who also discovered that the ciliated chambers of Sponges are lined by collared cells of the same peculiar structure as the individual Choanoflagellata, and hence was led to regard the Sponges as colonies of Choanoflagellata. Saville Kent (69) has added much to our knowledge of the group, and by his discovery of *Proterospongia* (see Fig. XXI. 15, and description) has rendered the derivation of the Sponges from the Flagellata a tenable hypothesis.]

Further remarks on the Flagellata.—Increased attention has been directed of late years to the Flagellata in consequence of the researches of Cienkowski, Bütschli, James Clark, Saville Kent, and Stein. They present a very wide range of structure, from the simple amoeboid forms to the elaborate colonies of *Volvox* and *Proterospongia*. By some they are regarded as the parent-group of the whole of the Protozoa; but, whilst not conceding to them this position, but removing to the *Proteomyxa* those Flagellata which would justify such a view, we hold it probable that they are the ancestral group of the mouth-bearing Corticata, and that the Ciliata and Dinoflagellata have been derived from them. One general topic of importance in relation to them may be touched on here, and that is the nature of the flagellum and its movements. Speaking roughly, a flagellum may be said to be an isolated filament of vibratile protoplasm, whilst a cilium is one of many associated filaments of the kind. The movement, however, of a flagellum is not the same as that of any cilium; and the movement of all flagella is not identical. A cilium is simply bent and straightened alternately, its substance probably containing, side by side, a contractile and an elastic fibril. A flagellum exhibits lash-

ing movements to and fro, and is thrown into serpentine waves during these movements. But two totally distinct kinds of flagella are to be distinguished, viz., (a) the pulsellum, and (b) the tractellum. An example of the pulsellum is seen in the tail of a spermatozoon which drives the body in front of it, as does the tadpole's tail. Such a "pulsellum" is the cause of the movement of the Bacteria. It is never found in the Flagellata. So little attention has been paid to this fact that affinities are declared by recent writers to exist between Bacteria and Flagellata. The flagellum of the flagellata is totally distinct from the pulsellum of the Bacteria. It is carried in front of the body and draws the body after it, being used as a man uses his arm and hand when swimming on his side. Hence it may be distinguished as a "tractellum." Its action may be best studied in some of the large Euglenoidea, such as *Astasia*. Here it is stiff at the base, and is carried rigidly in front of the animal, but its terminal third is reflected and exhibits in this reflected condition swinging and undulatory movements tending to propel the reflected part of the flagellum forward, and so exerting a traction in that direction upon the whole animal. It is in this way (by reflection of its extremity) that the flagellum or tractellum of the Flagellata also acts so as to impel food-particles against the base of the flagellum where the oral aperture is situated.

Many of the Flagellata are parasitic (some hæmatozoic, see Lewis, 70); the majority live in the midst of putrefying organic matter in sea and fresh waters, but are not known to be active as agents of putrefaction. Dallinger and Drysdale have shown that the spores of Bodo and others will survive an exposure to a higher temperature than do any known Schizomycetes (Bacteria), viz., 250° to 300° Fahr., for ten minutes, although the adults are killed at 180°.

CLASS III. DINOFLAGELLATA, Bütschli.

Characters.—Corticate Protozoa of a bilaterally asymmetrical form, sometimes flattened from back to ventral surface (Dipllopsalis, Glenodinium), sometimes from the front to the hinder region (Ceratium, Peridinium), sometimes from right to left (Dinophysis, Amphidinium, Prorocentrum)—the anterior region and ventral surface being determined by the presence of a longitudinal groove and a large flagellum projecting from it. In all except the genus *Prorocentrum* (Fig. XXII. 6) there is as well as a longitudinal groove a transverse groove (hence Dinifera) in which lies horizontally a second flagellum (Klebs and Bütschli), hitherto mistaken for a girdle of cilia. The transverse groove lies either at the anterior end of the body (Dinophysis, Fig. XXII. 3, 4; Amphidinium) or at the middle. In *Gymnodinium* it takes a spiral course. In *Polykrikos* (a compound metameric form) there are eight independent transverse grooves.

The Dinoflagellata are either enclosed in a cuticular shell (Ceratium, Peridinium, Dinophysis, Dipllopsalis, Glenodinium, Prorocentrum, etc.) or are naked (*Gymnodinium* and *Polykrikos*). The cuticular membrane (or shell) consists of cellulose or of a similar substance (cf. *Labyrinthulida*) and not, as has been supposed, of silica, nor of chitin-like substance; it is either a simple cyst or perforated by pores, and may be built up of separate plates (Fig. XXII. 10).

The cortical protoplasm contains trichocysts in *Polykrikos*.

The medullary protoplasm contains often chlorophyll and also diatomin and starch or other amyloid substance. In these cases (Ceratium, some species of Peridinium, Glenodinium, Prorocentrum, *Dinophysis acuta*) nutrition appears to be holophytic. But in others (*Gymnodinium* and *Polykrikos*) the substances are absent and food-particles are found in the medullary protoplasm which have been taken in from the exterior through a mouth; in these nutrition is holozoic. In others which are devoid of chlorophyll and diatomin, etc., there is found a vesicle and an orifice connected with the exterior near the base of the flagellum (cf. Flagellata) by which water and dissolved or minutely granular food-matter is introduced into the medullary protoplasm (*Protoperidinium pellucidum*, *Peridinium divergens*, *Dipllopsalis lenticula*, *Dinophysis laevis*). It is important to note that these divergent methods of nutrition are exhibited by different species of one and the same genus, and possibly by individuals of one species in successive phases of growth (?).

No contractile vacuole has been observed in Dinoflagellata.

The nucleus is usually single and very large, and has a peculiar labyrinthine arrangement of chromatin substance.

Transverse binary fission is the only reproductive process as yet ascertained. It occurs either in the free condition (Fig. XXII. 2) or in peculiar horned cysts (Fig. XXII. 8). Conjugation has been observed in some cases (by Stein in *Gymnodinium*).

FIG. XXII.—Dinoflagellata and Rhynchoflagellata. N. B. In all these figures the apparent girdle of cilia is, according to Klebs's and Bütschli's recent discovery, to be interpreted as an encircling flagellum lying in the transverse groove. 1. *Peridinium uberrimum*, Allman; $\times 300$ (fresh-water ponds, Dublin). Probably (according to Bütschli) the processes on the surface are not cilia nor flagellum. Both the longitudinal and the transverse groove are well seen. 2. The same species in transverse fission. 3. *Dinophysis ovata*, Cl. and L.; $\times 350$ (salt water, Norwegian coast). 4. *Dinophysis acuminata*, Cl. and L.; $\times 350$ (salt water, Norwegian coast). 5. *Gymnodinium* sp.; $\times 600$. 6. *Prorocentrum micans*, Ehr.; $\times 300$ (salt water). 7. Dorsal aspect of the same species. 8. 9. Cysts of *Peridinium*; the contents of 8 divided into 8 minute naked *Peridinia*; $\times 300$. 10. Empty cuirass of *Ceratium divergens*, Cl. and L.; $\times 500$; showing the form and disposition of its component plates. 11. The same species with the animal contracted into a spherical form. The transverse groove well seen. 12. The same species in the normal state. The apparent girdle of cilia is really an undulating flagellum lying in the transverse groove. 13, 14. Young stages of *Noctiluca miliaris*. *n*, nucleus; *s*, the so-called spine (superficial ridge of the adult); *a*, the big flagellum; the unlettered filament is a flagellum which becomes the oral flagellum of the adult. 15. *Ceratium tripos*, Müll. The transverse groove well seen. The cilia really are a single horizontal

flagellum. 16, 17. Two stages in the transverse fission of *Noctiluca miliaris*, Suriray. *n*, nucleus; *N*, food-particles; *t*, the muscular flagellum. 18. *Noctiluca miliaris*, viewed from the aboral side (after Allman, *Quart. Jour. Mic. Sci.*, 1872). *a*, the entrance to the atriolum or flagellar fossa (= longitudinal groove of *Dinoflagellata*); *c*, the superficial ridge; *d*, the big flagellum (= the flagellum of the transverse groove of *Dinoflagellata*); *h*, the nucleus. 19. The animal acted upon by iodine solution, showing the protoplasm like the "primordial utricle" of a vegetable cell shrunk away from the structureless firm shell or cuirass. 20. Lateral view of *Noctiluca*, showing *a*, the entrance to the groove-like atriolum or flagellar fossa in which *b* is placed; *c*, the superficial ridge; *d*, the big flagellum; *e*, the mouth and gullet, in which is seen Krohn's oral flagellum (= the chief flagellum or flagellum of the longitudinal groove of *Dinoflagellata*); *f*, broad process of protoplasm extending from the superficial ridge *c* to the central protoplasm; *g*, duplicature of the shell in connection with the superficial ridge; *h* nucleus.

Mostly marine, some fresh-water. Many are phosphorescent.

The Dinoflagellata are divisible into two orders, according to the presence or absence of the transverse groove.

ORDER 1. ADINIDA, Bergh.

Characters.—Body compressed laterally; both longitudinal and transverse flagellum placed at the anterior pole; a transverse groove is wanting; a cuticular shell is present.

Genera.—*Procerentrum*, Ehr. (Fig. XXII. 6, 7); *Exuviella*, Cienk. (= *Dinopyxis*, Stein; *Cryptomonas*, Ehr.).

ORDER 2. DINIFERA, Bergh.

Characters.—A transverse groove is present and usually a longitudinal groove. The animals are either naked or loricate.

Fam. 1. DINOPHYIDA, Bergh. Body compressed; the transverse groove at the anterior pole; the longitudinal groove present; longitudinal flagellum directed backwards; loricate.

Genera.—*Dinophysis*, Ehr. (Fig. XXII. 3, 4); *Amphidinium*, Cl. & L.; *Amphisolenia*, Stein; *Histioneis*, Stein; *Citharistes*, Stein; *Ornithocercus*, Stein.

Fam. 2. PERIDINIDA, Bergh. Body either globular or flattened; transverse groove nearly equatorial; longitudinal groove narrow or broad; loricate.

Genera.—*Protoperidinium*, Bergh; *Peridinium* (Ehr.), Stein (Fig. XXII. 1, 2); *Protoceratium*, Bergh; *Ceratium*, Schrank (Fig. XXII. 15); *Diplopsalis*, Bergh; *Glenodinium*, Ehr.; *Heterocapsa*, Stein; *Gonyaulax*, Diesing; *Goniadoma*, Stein; *Blepharocysta*, Ehr.; *Podolampas*, Stein; *Amphidoma*, Stein; *Oxytoxum*, Stein; *Ptychodiscus*, Stein; *Pyrophacus*, Stein; *Ceratocorys*, Stein.

Fam. 3. GYMNODINIDA, Bergh. As *Peridinida* but no lorica (cuticular shell).

Genera.—*Gymnodinium* (Fig. XXII. 5), Stein; *Hemidinium*, Bergh.

Fam. 4. POLYDINIDA, Bütschli. As *Gymnodinida*, but with several independent transverse grooves.

Genus.—*Polykrikos*, Bütschli.

Further Remarks on the Dinoflagellata.—This small group is at the moment of the printing of the present article receiving a large amount of attention from Bergh (81), Klebs (83), and Bütschli (82), and has recently been greatly extended by the discoveries of Stein (80),—the last work of the great illustrator of the Ciliate Protozoa before his death.

The constitution of the cell-wall or cuticle from cellulose, as well as the presence of chlorophyll and diatomine, and the holophytic nutrition of many forms recently demonstrated by Bergh, has led to the suggestion that the Dinoflagellata are to be regarded as plants, and allied to the Diatomaceae and Desmidiaceae. Physiological grounds of this kind have, however, as has been pointed out above, little importance in determining the affinities of Protozoa. Bütschli (82) in a recent very important article has shown in confirmation of Klebs that the Dinoflagellata do not possess a girdle of cilia as previously supposed, but that the structure mistaken for cilia is a second flagellum which lies horizontally in the transverse groove. Hence the name *Cilioflagellata* is superseded by *Dinoflagellata* (Gr. *dinos*, the round area where oxen tread out on a threshing floor).

Bütschli further suggests that the Dinoflagellata with their two flagella and their I-shaped combination of longitudinal and transverse grooves may be derived from the *Cryptomonadina* (see page 883). In the latter a groove-like recess is present in connection with the origin of the two

FIG. XXIII. Ciliata.—1. *Spirostomum ambiguum*, Ehr.; one of the Heterotricha; $\times 120$. Observe on the right side the oral groove and special heterotrichous band of long cilia. *a*, conical nucleus; *b*, contractile vacuole. 2. *Sentor polymorphus*, Müller; one of the Heterotricha; $\times 50$; group of individuals with the area fringed by the heterotrichous cilia expanded trumpet-wise. 3. *Tintinnus lagenula*, C. and L.; one of the Heterotricha; $\times 300$. 4. *Strombidium Claparedis*, S. K.; one of the Peritricha; $\times 200$. 5. Empty shell of *Codonella campanella*, Haeck; one of the Heterotricha; $\times 180$. 6, 7. *Torquatella typica*, Lankester. *p*, the supra-oral lobe seen through the membranous collar. 8, 9. View of the base and of the side of *Trichodina pediculus*, Ehr.; one of the Peritricha; $\times 300$. *a*, nucleus; *c*, corneous collar; *d*, mouth. 10. *Spirochona gemmipara*, Stein; one of the Peritricha; $\times 350$. *a*, nucleus; *g*, bud. 11. *Vorticella citrina*, Ehr.; 150 (Peritricha). At *d* multiple fission of an individual cell to form "microgonidia." 12. *Vorticella microstoma*, Ehr. (Peritricha); $\times 300$. At *e* eight "microgonidia" formed by fission of a single normal individual. 13. Same species, binary fission. *a*, elongated nucleus. 14. *Vorticella nebulifera*, Ehr.; free-swimming zooid resulting from fission in the act of detaching itself and swimming away, possessing a posterior circlet of cilia. *e*, ciliated disk; *f*, pharynx. 15. *Vorticella microstoma*, Ehr.; normal

zooid with two microgonidia (or microzooids) *c*, *d*, in the act of conjugation. *a*, nucleus; *b*, contractile vacuole; *e*, ciliated disk; *f*, pharynx. 16. *Vorticella microstoma*, Ehr., with stalk contracted and body enclosed in a cyst. *a*, nucleus. 17. *Vorticella nebulifera*, Ehr. *a*, nucleus; *b*, contractile vacuole; *c*, muscular region of the body continuous with the muscle of the stalk; *d*, pharynx (the basal continuation of the oral vestibule which receives at a higher point the fecal excreta and the ejected liquid from the contractile vacuole). 18. *Carchesium spectabile*, Ehr.; retractile colony; $\times 50$. 19. Trichocysts of *Epistylis flavicans*, Ehr., as figured by Greeff. 20. *Opercularia stenostoma*, Stein; $\times 200$; a small colony. Observe the ciliation of the oral vestibule and the upstanding ciliate disk (opercular-like). 21, 22. *Physicula affinis*, S. K.; one of the stalked loricate Peritricha, in expanded and retracted states. *a*, the true operculum. 23, 24. *Gyrocotis oxyura*, Stein; one of the free-swimming Peritricha, with spiral equatorial cilia-band; $\times 250$. *b*, contractile vacuole. 25, 26. *Thuricula valvata*, Str. Wright; one of the sessile tubicolous Peritricha. Two individuals are as a result of fission temporarily occupying one tube; *u*, the valve attached to the tube like the door of the trap-door spider's nest and the valve of the Gasteropod Clausium.

flagella. Bütschli thinks the large proboscis-like flagellum of Noctiluca (Rhynchoflagellata) represents the horizontal flagellum of Dinoflagellata, whilst the prominent longitudinal flagellum of the Dinoflagellata is represented in that animal by the small flagellum discovered by Krohn within the gullet (see Fig. XXII. 20, *e*). The young form of Noctiluca (Fig. XXII. 14) has the longitudinal flagellum still of large size.

The phosphorescence of many Dinoflagellata is a further point of resemblance between them and Noctiluca.

Bergh has shown that there is a considerable range of form in various species of Dinoflagellata (*Ceratium*, etc.), and has also drawn attention to the curious fact that the mode of nutrition (whether holophytic or holozoic) differs in allied species. Possibly it may be found to differ according to the conditions of life in individuals of one and the same species.

The drawings in Fig. XXII. were engraved before the publication of Bütschli's confirmation of Klebs's discovery as to the non-existence of cilia in the transverse groove. The hair-like processes figured by Allman (91) external to the transverse groove in his *Peridinium uberrimum* (Fig. XXII. 1, 2) cannot, however, be explained as a flagellum. Bütschli inclines to the opinion that their nature was misinterpreted by Allman, although the latter especially calls attention to them as cilia, and as rendering his *P. uberrimum* unlike the *Peridinium* of Ehrenberg, in which the cilia (horizontal flagellum) are confined to the transverse groove.

CLASS IV. RHYNCHOFLLAGELLATA, Lankester.

Characters.—Corticate Protozoa of large size ($\frac{1}{10}$ inch) and globular or lenticular form, with a firm cuticular membrane and highly vacuolated (reticular) protoplasm. In Noctiluca a deep groove is formed on one side of the spherical body, from the bottom of which springs the thick transversely striated proboscis or "big flagellum." Near this is the oral aperture and a cylindrical pharynx in which is placed the second or smaller flagellum (corresponding to the longitudinal flagellum of Dinoflagellata).

Nutrition is holozoic. No contractile vacuole is present; granule-streaming is observed in the protoplasm. An alimentary tract and anus have been erroneously described. The nucleus is spherical and not proportionately large (see for details Fig. XXII. 18 to 20).

Reproduction by transverse fission occurs, also conjugation and, either subsequently to that process or independently of it, a formation of spores (Cienkowski, 87), the protoplasm gathering itself, within the shell-like cuticular membrane, into a cake which divides rapidly into numerous flagellated spores (flagellulæ). These escape and gradually develop into the adult form (Fig. XXII. 13, 14).

The proboscis-like large flagellum is transversely striated, and exhibits energetic but not very rapid lashing movements.

Noctiluca is phosphorescent, the seat of phosphorescence being, as determined by Allman (86), the cortical layer of protoplasm underlying the cuticular shell or cell-wall as the primordial cuticle of a vacuolated vegetable cell underlies the vegetable cell-wall.

Genera.—Only two genera (both marine) are known: *Noctiluca*, Suriray (90) (Fig. XXII. 17-20); *Leptodiscus*, Hertwig (88).

FIG. XXIV. Ciliata.—1. *Ophalinospis septiole*, Foett.: a parasitic mouthless Ciliate from the liver of the Squid. *a*, nuclei; *b*, vacuoles (non-contractile). 2. A similar specimen treated with picrocarmine, showing a remarkably branched and twisted nucleus; *a*, in place of several nuclei. 3. *Trichonympha agilis*, Leidy: parasitic in the intestine of the Termites (White Ants); $\times 600$. *a*, nucleus; *b*, granules (food?). 4. *Opalina ranarum*, Purkinje: a Holotrichous mouthless Ciliate parasitic in the Frog's rectum; adult; $\times 100$. *a*, the numerous regularly dispersed nuclei. 5. The same; an individual in process of binary fission. *a*, nuclei. 6. The same; the process of fission has now reduced the individuals to a relatively small size. 7. Smallest fission produced fragment encysted, expelled from the Frog in this state and swallowed by Tadpoles. 8. Young uninucleate individual which has emerged from the cyst within the Tadpole, and will now multiply its nuclei and grow to full size before in turn undergoing retrogressive fission. 9. *Anoplophrya naidoides*, Duj.: a mouthless Holotrichous Ciliate parasitic in the worm Nais; $\times 200$. *a*, the large axial nucleus; *b*, contractile vacuoles. 10. *Anoplophrya prolifera*, C. and L.; from the intestine of Clitellio. Remarkable for the adhesion in a metameric series of incomplete fission-products. *a*, nucleus. 11. *Amphileptus gigas*, C. and L.; one of the Holotricha; $\times 100$. *b*, contractile vacuoles; *c*, trichocysts (see Fig. XXIII. 19); *d*, nucleus; *e*, pharynx. 12, 13. *Prorodon niveus*, Ehr.: one of the Holotricha; $\times 75$. *a*, nucleus; *b*, contractile vacuole; *c*, pharynx with horny fascicular lining. 12. The fasciculate cuticle of the pharynx isolated. 14. *Trachelius ovum*,

Ehr. (Holotricha); $\times 80$; showing the reticulate arrangement of the medullary protoplasm. *b*, contractile vacuoles; *c*, the cuticle-lined pharynx. 15, 16, 17, 18. *Ichthyophthirius multifiliis*, Fouquet; one of the Holotricha; $\times 120$. Free individual and successive stages of division to form spores. *a*, nucleus; *b*, contractile vacuoles. 19. *Didinium nasutum*, Müll.; one of the Peritricha; $\times 200$. The pharynx is everted and has seized a *Paramecium* as food, *a*, nucleus; *b*, contractile vacuole; *c*, everted pharynx. 20. *Euplotes charon*, Müll.; one of the Hypotricha; lateral view of the animal when using its great hypotrichous processes, *x*, as ambulatory organs. 21. *Euplotes harpa*, Stein (Hypotricha); $\times 150$. *h*, mouth; *x*, hypotrichous processes (limbs). 22. *Nyctotherus cordiformis*, Stein; a Heterotrichous Ciliate parasitic in the intestine of the Frog. *a*, nucleus; *b*, contractile vacuole; *c*, food particle; *d*, anus; *e*, heterotrichous band of large cilia; *f*, *g*, mouth; *h*, pharynx; *i*, small cilia.

Further Remarks on the Rhynchoflagellata.—The peculiar and characteristic feature of Noctiluca appears to be found in its large transversely-striated flagellum, which, according to Bütschli, is not the same as the longitudinal flagellum of the Dinoflagellata, but probably represents the horizontal flagellum of those organisms in a modified condition; hence the name here proposed—Rhynchoflagellata.

Noctiluca is further remarkable for its large size and cyst-like form, and the reticular arrangement of its protoplasm, like that of a vegetable cell. This is paralleled in *Trachelius ovum* among the Ciliata (Fig. XXIV. 14), where the same stiffening of the cuticle allows the vacuolation of the subjacent protoplasm to take place. The remarkable *Leptodiscus medusoides* of R. Hertwig (88) appears to be closely related to Noctiluca.

It would no doubt be not unreasonable to associate the Dinoflagellata and the Rhynchoflagellata with the true Flagellata in one class. But the peculiarities of the organization of the two former groups is best emphasized by treating them as separate classes derived from the Flagellata. Neither group leads on to the Ciliata or to any other group, but they must be regarded as forming a lateral branch of the family tree of Corticata. The relationship of Noctiluca to Peridinium was first insisted upon by Allman, but has quite recently been put in a new light by Bütschli, who identifies the atrial recess of Noctiluca (Fig. XXII. 20, *b*) with the longitudinal furrow or groove of the Dinoflagellata, and the large and minute flagella of the former with the transverse and longitudinal flagella respectively of the latter. The superficial ridge *c* of Noctiluca appears to represent the continuation of the longitudinal groove.

The phosphorescence of the sea, especially on northern coasts, is largely caused by Noctiluca, but by no means exclusively, since Medusae, Crustaceans, Annelids, and various Protozoa often take part in the phenomenon. Not unfrequently, however, the phosphorescence on the British coasts seems to be solely due to Noctiluca, which then occurs in millions in the littoral waters.

CLASS V. CILIATA, Ehrenberg (*Infusoria sensu stricto*)

Characters.—Corticata of relatively large size, provided with either a single band of cilia surrounding the anteriorly placed oral aperture or with cilia disposed more numerous over the whole surface of the body. The cilia are distinguished from the flagella of Flagellata by their smaller size and simple movements of alternate flexion and erection; they serve always at some period of growth as locomotor organs, and also very usually as organs for the introduction of food particles into the mouth. Besides one larger oblong nucleus a second (the paramecium) is invariably (?) present (Fig. XXV. 2), or the nucleus may be dispersed in small fragments. Conjugation of equal-sized individuals, not resulting in permanent fusion, is frequent. The conjugated animals separate and their nuclei and paramecia undergo peculiar changes; but no formation of spores, either at this or other periods, has been decisively observed (Fig. XXV. 8 to 15). Multiplication by transverse fission is invariably observed in full-grown individuals. (Fig. XXV. 16), and conjugation appears to take place merely as an interlude in the fissiparous process; consequently young or small Ciliata are (with few exceptions) unknown. Possibly spore-formation may hereafter be found to occur at rare intervals more generally than is at present supposed (Fig. XXIV. 15, 18). A production of microgonidia by rapid fission occurs in some Peritricha (Fig. XXIII. 11, 12, 14, 15), the liberated microgonidia conjugating with the normal individuals, which also can conjugate with one another.

The Ciliata, with rare exceptions (parasites), possess one

FIG. XXV. Ciliata (conjugation, etc.). 1. Surface view of Holotrichous Ciliate, showing the disposition of the cilia in longitudinal rows. 2. Diagrammatic optical section of a Ciliate Protozoon, showing all structures except the contractile vacuoles. *a*, nucleus; *b*, paranucleus (so-called nucleolus); *c*, cortical substance; *d*, extremely delicate cuticle; *e*, medullary (more fluid) protoplasm; *f*, cilia; *g*, trichocysts; *h*, filaments ejected from the trichocysts; *i*, oral aperture; *k*, drop of water containing food-particles, about to sink into the medullary substance and form a food-vacuole; *l*, *m*, *n*, *o*, food-vacuoles, the successive order of their formation corresponding to the alphabetical sequence of the letters; the arrows indicate the direction of the movement of rotation of the medullary protoplasm; *p*, pharynx. 3. Outline of a Ciliate (*Paramecium*), to show the form and position of the contractile vacuoles. 4-7. Successive stages in the periodic formation of the contractile vacuoles. The ray-like vacuoles discharge their contents into the central vacuole, which then itself bursts to the exterior. 8-15. Diagrams of the changes undergone by the nucleus and paranucleus of a typical Ciliate during and immediately after conjugation: *N*, nucleus; *pn*, paranucleus; 8, condition before conjugation; 9, conjugation effected; both nucleus and paranucleus in each animal elongate and become fibrillated; 10, two spherical paranuclei *pn*² in each, two dividing or divided nuclei *N*²; 11, the spherical paranuclei have become fusiform; 12, there are now four paranuclei in each (*pn*⁴ and *pn*²),

and a nucleus broken into four or even more fragments; 13, the two paranuclei marked *pn*² in 12 have united in each animal to form the new nucleus *pn*²; the nuclear fragments are still numerous; 14, after cessation of conjugation the nuclear fragments *N* and the two unfused paranuclear pieces *pn*⁴ are still present; 15, from a part or all of the fragments the new paranucleus is in process of formation, the new nucleus (*pn*²—*N*) is large and elongated. 16. Diagram of a Ciliate in process of transverse fission. 17. Condition of the nucleus *N*, and of the paranucleus *pn* in *Paramecium aurelia* after cessation of conjugation as observed by Bütschli. 18. *Stylonichia mytilus* (one of the Hypotricha), showing endoparasitic unicellular organisms *b*, formerly mistaken for spores; *a*, nuclei (after conjugation and breaking up).

or more contractile vacuoles (Fig. XXV. 3). They always possess a delicate cuticle and a body-wall which, although constant, in form is elastic. They may be naked and free-swimming, or they may form horny (Fig. XXIII. 21, 25) or silicious cup-like shells or gelatinous envelopes, and may be stalked and form colonies like those of Choanoflagellata, sometimes with organic connection of the constituent units of the colony by a branching muscular cord (Vorticellidae). Many are parasitic in higher animals, and of these some are mouthless. All are holozoic in their nutrition, though some are said to combine with this saprophytic and holophytic nutrition.

The Ciliata are divisible into four orders according to the distribution and character of their cilia. The lowest group (the Peritricha) may possibly be connected through some of its members, such as *Strombidium* (Fig. XXIII. 4), with the Flagellata through such a form as *Lophomonas* (Fig. XXI. 9).

In the following synopsis, chiefly derived from Saville Kent's valuable treatise (71), the characters of the families and the names of genera are not given at length owing to the limitation of our space.

ORDER 1. PERITRICHIA, Stein (79).

Characters.—Ciliata with the cilia arranged in one anterior circlet or in two, an anterior and a posterior; the general surface of the body is destitute of cilia.

Sub-order 1. NATANTIA (animals never attached).

Fam. 1. TORQUATELLIDÆ.

Genus.—*Torquatella*, Lankester, like *Strombidium*, but the cilia adherent so as to form a vibratile membranous collar (Fig. XXIII. 6, 7).

Fam. 2. DICTYOCYSTIDÆ. Animals loricate.

Fam. 3. ACTINOBOLIDÆ. Illoricate, with retractile tentacula.

Fam. 4. HALTERIIDÆ.

Genera.—*Strombidium*, Cl. & L. (Fig. XXIII. 4); *Halteria*, Dujard., with a supplementary girdle of springing hairs; *Didinium*, Stein (Fig. XXIV. 19).

Fam. 5. GYROCORIDÆ.

Genera.—*Gyrocoris*, Stein, with an equatorial ciliary girdle spirally disposed (Fig. XXIII. 23, 24); *Urocen-tium*, Nitzsch, girdle annular.

Fam. 6. URCEOLARIIDÆ.

Genera.—*Trichodina*, Ehr.; two ciliate girdles; body shaped as a pyramid with circular sucker-like base, on which is a toothed corneous ring (Fig. XXIII. 8, 9); *Lienophora*, Clap.; *Cyclochaeta*, Hat. Jacks.

Fam. 7. OPHRYOSCOLECIDÆ.

Genera.—*Astylozoon*, Engelm.; *Ophryoscolex*, Stein.

Sub-order 2. SEDENTARIA, animals always attached or sedentary during the chief part of the life history.

Fam. 1. VORTICELLIDÆ. Animals ovate, campanulate, or sub-cylindrical; oral aperture terminal, eccentric, associated with a spiral fringe of adoral cilia, the right limb of which descends into the oral aperture, the left limb encircling a more or less elevated protrusible and retractile ciliary disk.

Sub-family 1. Vorticellinæ; animalcules naked.

a.—Solitary forms.

Genera.—*Gerda*, Cl. and L.; *Scyphidia*, Dujard.; *Spirochona*, Stein (sessile with peristome in the form of a spirally convolute membranous expansion, Fig. XXIII. 10); *Pyxidium*, Kent (with a non-retractile stalk); *Vorticella*, Linn. with a hollow stalk in which is a contractile muscular filament.)

β.—Forming dendriform colonies.

Genera.—*Carchesium*, Ehr. (Fig. XXIII. 18, with contractile stalks); *Zoothamnium*, Ehr. (contractile stalks); *Epistylis*, Ehr. (stalk rigid); *Opercularia*, Stein (stalk rigid, cilli-

ated disk oblique; an elongated peristomial collar, Fig. XXIII. 20).

Sub-family 2. Vaginicolinae; animalcules secreting firm cup-like or tube-like membranous shells.

Genera.—*Vaginicola*, Lamarck (no internal valve); *Thuricola*, Kent (with a door-like valve to the tube, Fig. XXIII. 25, 26); *Cothurina*, Ehr. (lorica or shell pediculate; no operculum); *Pyxioia*, Kent (lorica pedunculate, animal carrying dorsally a horny operculum, Fig. XXIII. 21, 22).

Sub-family 3. Ophrydina; animalcules secreting a soft gelatinous envelope.

Genera.—*Ophionella*, Kent; *Ophrydium*, Ehr.

ORDER 2. HETEROTRICHIA, Stein.

Characters.—A band or spiral or circlet of long cilia is developed in relation to the mouth (the heterotrichous band) corresponding to the adoral circlet of Peritricha; the rest of the body is uniformly beset with short cilia.

a.—Heterotrichal band circular.

Genera.—(selected).—*Tintinnus*, Schranck (Fig. XXIII. 3); *Trichodinopsis*, Cl. and L.; *Codonella*, Haeck. (with a peri-oral fringe of lapet-like processes); *Calceolus*, Diesing.

β.—Heterotrichal band spiral.

Genera (selected).—*Stentor*, Oken (Fig. XXIII. 2); *Blepharisma*, Perty (with an undulating membrane along the oral groove); *Spirostomum*, Ehr. (oral groove linear and elongate, Fig. XXIII. 1) *Leucophrys*, Ehr. (oral groove very short).

γ.—Heterotrichal band in the form of a simple straight or oblique adoral fringe of long cilia.

Genera (selected).—*Bursaria*, Müller; *Nyctotherus*, Leidy (with well-developed alimentary tract and anus, Fig. XXIV. 22); *Balantidium*, Cl. and L. (*B. coli* parasitic in the human intestine).

ORDER 3. HOLOTRICHIA, Stein.

Characters.—There is no special adoral fringe of larger cilia, nor a band-like arrangement of cilia upon any part of the body; short cilia of nearly equal size are uniformly disposed all over the surface. The adoral cilia sometimes a little longer than the rest.

a.—With no membraniform expansion of the body wall.

Genera.—*Paramoecium*, Ehr. (Fig. XXV. 1, 2); *Prorodon*, Ehr. (Fig. XXIV. 13); *Coleps*, Ehr.; *Enchelys*, Ehr.; *Trachelocerca*, Ehr.; *Trachelius*, Ehr.; *Amphileptus*, Ehr.; *Ichthyophthirius*, Fouquet (Fig. XXIV. 15).

β.—Body with a projecting membrane, often vibratile.

Genera.—*Ophryoglena*, Ehr.; *Colpidium*, Stein; *Lembus*, Cohn; *Trichonympha*, Leidy (an exceptionally modified form, parasitic, Fig. XXIV. 3).

γ.—Isolated parasitic forms, devoid of a mouth.

Genera.—*Opalina*, Perkinje (nuclei numerous, no contractile vacuole, Fig. XXIV. 4 to 8); *Benedenia*, Foett.; *Opalinopsis*, Foett. (Fig. XXIV. 1, 2); *Anoplophrya*, Stein (large axial nucleus, numerous contractile vacuoles in two linear series, Fig. XXIV. 9, 10); *Haptophrya*, Stein; *Hoplitophrya*, Stein.

ORDER 4. HYPOTRICHIA, Stein.

Characters.—Ciliata in which the body is flattened and the locomotive cilia are confined to the ventral surface, and are often modified and enlarged to the condition of muscular appendages (setae so-called). Usually an adoral band of cilia, like that of Heterotricha. Dorsal surface smooth or provided with tactile hairs only. Mouth and anus conspicuously developed.

a.—Cilia of the ventral surface uniform fine, and vibratile.

Genera.—*Chilodon*, Ehr.; *Lozodes*, Ehr.; *Dysteria*, Huxl.; *Huxleya*, Cl. and L.

β.—Cilia of the ventral surface variously modified as setae (muscular appendages), styles, or uncini.

Genera.—*Stylomichia*, Ehr. (Fig. XXV. 18); *Oxytricha*, Ehr.; *Euploes*, Ehr. (Fig. XXIV. 20, 21).

Further remarks on the Ciliata.—The Ciliata have recently formed the subject of an exhaustive treatise by Mr. Saville Kent (71) which is accessible to English readers. On the other hand Prof. Bütschli has not yet dealt with them in his admirable critical treatise on the Protozoa. Hence a large space has not been devoted in this article to the systematic classification and enumeration of their genera. See (79) and (93).

One of the most interesting features presented by the group is the presence in many of a cell anus as well as a cell mouth (Fig. XXIV. 22 d). In those devoid of an anus the undigested remnants of food are expelled either by a

temporary aperture on the body-surface or by one opening into the base of the pharynx. In many parasitic Ciliata, as in higher animal parasites, such as the Cestoid worms, a mouth is dispensed with, nutriment being taken by general imbibition and not in the solid form. Many Ciliata develop chlorophyll corpuscles of definite biconcave shape, and presumably have so far a capacity for vegetal nutrition. In *Vorticella viridis* the chlorophyll is uniformly diffused in the protoplasm and is not in the form of corpuscles (72).

The formation of tubes or shells and in connection therewith of colonies is common among the Peritricha and Heterotricha. The cuticle may give rise to structures of some solidity in the form of hooks or tooth-like processes, or as a lining to the pharynx (Fig. XXIV. 12).

The phenomena connected with the conjugation and reproduction are very remarkable, and have given rise to numerous misconceptions. They are not yet sufficiently understood. It cannot be surely asserted that any Ciliate is at the present time known to break up, after encystment or otherwise, into a number of spores, although this was at one time supposed to be the rule. *Ichthyophthirius* (Fig. XXIV. 15 to 18) and some *Vorticellæ* (76) have been stated, even recently, to present this phenomenon; but it is not impossible that the observations are defective. The only approach to a rapid breaking up into spores is the multiple formation (eight) of microgonidia or microzooids in *Vorticellidæ* (Fig. XXIII. 11, 12); otherwise the result of the most recent observations appears to be that the Ciliata multiply only by binary fission, which is very frequent among them (longitudinal in the Peritricha, transverse to the long axis in the others).

Several cases of supposed formation of spores within an adult Ciliate and of the production endogenously of numerous "acineti-form young" have been shown to be cases of parasitism, minute unicellular parasites, e. g., parasitic *Acinetæ* (such as *Sphærophrya* described and figured in (Fig. XXVI.) being mistaken for the young.

The phenomenon of conjugation is frequent in the Ciliata, and is either temporary, followed by a separation of the fused individuals, as in most cases, or permanent, as in the case of the fertilization of normal individuals by the microgonidia of *Vorticellidæ*.

Since the process of conjugation or copulation is not followed by a formation of spores, it is supposed to have merely a fertilizing effect on the temporarily conjoined individuals, which nourish themselves and multiply by binary fission more actively after the process than before (hence termed "rejuvenescence").

Remarkable changes have been from time to time observed in the nuclei of Ciliata during or subsequently to conjugation, and these were erroneously interpreted by Balbiani (73) as indicating the formation of spermatozoa and ova. The nuclei exhibit at one period great elongation and a distinct fibrillation, as in the dividing nuclei of tissue cells (compare Fig. 1. and Fig. XXV. 9, 11, 17). The fibrillæ were supposed to be spermatozooids, and this erroneous view was confirmed by the observation of rod-like Bacteria (*Schizomycetes*) which in some instances infest the deeper protoplasm of large Ciliata.

The true history of the changes which occur in the nuclei of conjugating Ciliata has been determined by Bütschli (74) in some typical instances, but the matter is by no means completely understood. The phenomena present very great obstacles to satisfactory examination on account of their not recurring very frequently and passing very rapidly from one phase to another. They have not been closely observed in a sufficiently varied number of genera to warrant a secure generalization. The following scheme of the changes passed through by the nuclei must be regarded as necessarily referring to only a few of the larger Heterotricha, Holotricha and Hypotricha and is only probably true in so far as details are concerned, even for them. It is at the same time certain that some such series of changes occurs in all Ciliata as the sequence of conjugation.

In most of the Ciliata by the side of the large oblong nucleus is a second smaller body (or even two such bodies) which has been very objectionably termed the nucleolus (Fig. XXV. 8), but is better called the "paranucleus" since it has nothing to do with the nucleolus of a typical tissue-cell. When conjugation occurs and a "syzygium" is formed both nucleus and paranucleus in each conjugated animal elongate and show fibrillar structure (Fig. XXV. 10). Each nucleus and paranucleus now divides into two, so that we get two nuclei and two paranuclei in each animal. Elongation and fibrillation are then exhibited by each of these new elements and subsequently fission, so that we get four nuclei and four paranuclei in each animal (11, 12). The fragments of the original nucleus (marked N in the figures) now become more dispersed and broken into further

irregular fragments. Possibly some of them are ejected (so-called "cell excrement"); possibly some pass over from one animal to the other. Two of the pieces of the four-times-divided paranucleus now reunite (Fig. XXV. 13) and form a largish body which is the new nucleus. The remaining fragments of paranucleus and the broken-down nucleus now gradually disappear, and probably as a remnant of them we get finally a few corpuscles which unite to form the new paranucleus (14, 15). The conjugated animals which have separated from one another before the later stages of this process are thus reconstituted as normal Ciliata, each with its nucleus and paranucleus. They take food and divide by binary fission until a new period of conjugation arrives, when the same history is supposed to recur.

The significance of the phenomena is entirely obscure. It is not known why there should be a paranucleus or what it may correspond to in other cells—whether it is to be regarded simply as a second nucleus or as a structurally and locally differentiated part of an ordinary cell-nucleus, the nucleus and the paranucleus together being the complete equivalent of such an ordinary nucleus. An attempt has been made to draw a parallel between this process and the essential features of the process of fertilization (fusion of the spermatid and ovicell nuclei) in higher animals; but it is the fact that concerning neither of the phenomena compared have we as yet sufficiently detailed knowledge to enable us to judge conclusively as to how far any comparison is possible. Whilst there is no doubt as to the temporary fusion and admixture of the protoplasm of the conjugating Ciliata, it does not appear to be established that there is any transference of nuclear or paranuclear matter from one individual to the other in the form of solid formed particles.

Conjugation resulting merely in rejuvenescence and ordinary fission activity is observed in many Flagellata as well as in the Ciliata.

A noteworthy variation of the process of binary fission occurring in the parasite *Opalina* deserves distinct notice here, since it is intermediate in character between ordinary binary fission and that multiple fission which so commonly in Protozoa is known as spore-formation. In *Opalina* (Fig. XXIV. 4) the nucleus divides as the animal grows, and we find a great number of regularly disposed separate nuclei in its protoplasm. (The nuclei of many other Ciliata have recently been shown to exhibit extraordinary branched and even "fragmented" forms; compare Fig. XXIV. 2). At a certain stage of growth binary fission of the whole animal sets in and growth ceases. Consequently the products of fission become smaller and smaller (Fig. XXIV. 6). At last the fragments contain each but two, three or four nuclei. Each fragment now becomes encased in a spherical cyst (Fig. XXIV. 7). If this process had occurred rapidly we should have had a uninucleate *Opalina* breaking up at once into fragments (as a *Gregarina* does), each fragment being a spore and enclosing itself in a spore-case. The *Opalina ranarum* lives in the rectum of the Frog and the encysted spores are formed in the early part of the year. They pass out into the water and undergo no change unless swallowed by a Tadpole, in the intestine of which they forthwith develop. From each spore-case escapes a uninucleate embryo (Fig. XXIV. 8), which absorbs nourishment and grows. As it grows its nucleus divides, and so the large multinucleate form from which we started is reattained.

This history has important bearings, not only on the nature of sporulation, but also on the question of the significance of the multinucleate condition of cells. Here it would seem that the formation of many nuclei is merely an anticipation of the retarded fission process.

It is questionable how far we are justified in closely associating *Opalina*, in view of its peculiar nuclei, with the other Ciliata. It seems certain that the worm-parasites sometimes called *Opalina*, but more correctly *Anaplophrya*, etc., have no special affinity with the true *Opalina*. They not only differ from it in having one large nucleus, but in having numerous very active contractile vacuoles (75).

Recently it has been shown, more especially by Gruber (84); that many Ciliata are multinucleate and do not possess merely a single nucleus and a paranucleus. In *Oxytricha* the nuclei are large and numerous (about forty), scattered through the protoplasm, whilst in other cases the nucleus is so finely divided as to appear like a powder or dust diffused uniformly through the medullary protoplasm (*Trachelocerca*, *Choenia*). Carmine staining, after treatment with absolute alcohol, has led to this remarkable discovery. The condition described by Foettinger (85) in his *Opalinopsis* (Fig. XXIV. 1, 2) is an example of this pulverization of the nucleus. The condition of pulverization had led in some cases to a total failure to detect any nucleus in the living animal, and it was only by the use of reagents that the actual state of the case was revealed. Curiously enough, the pulverized nucleus appears periodically to form

itself by a union of the scattered particles into one solid nucleus just before binary fission of the animal takes place, and on the completion of fission the nuclei in the two new individuals break up into little fragments as before. The significance of this observation in relation to the explanation of the proceedings of the nuclei during conjugation cannot be overlooked. It also leads to the suggestion that the animal cell may at one time in the history of evolution have possessed not a single solid nucleus but a finely molecular powder of chromatin-substance scattered uniformly through its protoplasm, as we find actually in the living *Trachelocerca*.

Some of the Ciliata (notably the common *Vorticellæ*) have been observed to enclose themselves in cysts, but it does not appear that these are anything more than "hypocysts," from which the animal emerges unchanged after a period of drought or deficiency of food. At the same time there are observations which seem to indicate that in some instances a process of spore-formation may occur within such cysts (76).

The differentiation of the protoplasm into cortical and medullary substance is very strongly marked in the larger Ciliata. The food-particle is carried down the gullet by ciliary currents and is forced together with an adherent drop of water into the medullary protoplasm. Here a slow rotation of the successively formed food vacuoles is observed (Fig. XXV. 2, *l, m, n, o*), the water being gradually removed as the vacuole advances in position. It was the presence of numerous successively formed vacuoles which led Ehrenberg to apply to the Ciliata the not altogether inappropriate name "Polygastrica." The chemistry of the digestive process has not been successfully studied, but A. G. Bourne (8) has shown that when particles stained with water-soluble anilin blue are introduced as food into a *Vorticella* the coloring matter is rapidly excreted by the contractile vacuole in a somewhat concentrated condition.

The differentiation of the protoplasm of Ciliata in some special cases as "muscular" fibre cannot be denied. The contractile filament in the stalk of *Vorticella* is a muscular fibre and not simply undifferentiated contractile protoplasm; that is to say, its change of dimensions is definite and recurrent and is not rhythmic, as is the flexion of a cilium. (Perhaps in ultimate analysis it is impossible to draw a sharp line between the contraction of one side of a cilium which causes its flexion and the rhythmical contraction of some muscular fibres.) The movements of the so-called "setæ" of the *Hypotricha* are also entitled to be called "muscular," as are also the general contractile movements of the cortical substance of large Ciliata. Haeckel (77) has endeavored to distinguish various layers in the cortical substance, but, whilst admitting that, as in the *Gregarinæ*, there is sometimes a distinct fibrillation of parts of this layer, we cannot assent to the general distinction of a "myophane" layer as a component of the cortical substance.

Beneath the very delicate cuticle which, as a mere superficial pellicle of extreme tenuity, appears to exist in all Ciliata we frequently find a layer of minute oval sacs, which contain a spiral thread: the threads are everted from the sacs when irritant reagents are applied to the animal (Fig. XXV. 2, *g, h*). These were discovered by Allman (78), and by him were termed "trichocysts." They appear to be identical in structure and mode of formation with the nematocysts of the *Cœlentera* and *Platyhelminia*. Similar trichocysts (two only in number) are found in the spores of the *Myxosporidia* (see *ante*, page 879).

The comparative forms of the nucleus and of the contractile vacuoles, as well as of the general body-form, etc., of Ciliata may be learnt from an examination of Figs. XXIII., XXIV., XXV., and the explanations appended to them.

CLASS VI. ACINETARIA, Lankester (*Tentaculifera*, Huxley).

Characters.—Highly specialized Corticate Protozoa, probably derived from Ciliata, since their young forms are provided with a more or less complete investment of cilia. They are distinguished by having no vibratile processes on the surface of the body in the adult condition, whilst they have few or many delicate but firm tentacle-like processes, which are either simply adhesive or tubular and suctional. In the latter case they are provided at their extremity with a sucker-disk and have contractile walls, whereas in the former case they have more or less pointed extremities. The Acinetaria are sedentary in habit, even if not, as is usual, permanently fixed by a stalk. The nucleus is frequently arboriform. Reproduction is effected by simple binary fission, and by a modified fission (bud-fission) by which (as in *Reticularia* and *Arcella*) a number of small bud-like

FIG. XXVI.—*Acinetaria*. 1. *Rhyncheta cyclocum*, Zenker. *a*, nucleus; *b*, contractile vacuole; only a single tentacle, and that suckorial; $\times 150$. Parasitic on Cyclops. 2. *Sphaerophrya urostyla*, Maupas; normal adult; $\times 200$. *a*, nucleus; *b*, contractile vacuole. Parasitic in Urostyla. 3. The same dividing by transverse fission, the anterior moiety with temporarily developed cilia. *a*, nucleus; *b*, contractile vacuole. 4, 5, 6. *Sphaerophrya stentorea*, Maupas; $\times 200$. Parasitic in Stentor, and at one time mistaken for its young. 7. *Trichophrya epistylidis*, Cl. and L.; $\times 150$. *a*, nucleus; *b*, contractile vacuole. 8. *Hemio-phrya gemmipara*, Hertwig; $\times 400$. Example with six buds, into each of which a branch of the nucleus *a* is extended. 9. The same species, showing the two kinds of tentacles (the suckorial and the pointed), and the contractile vacuoles *b*. 10. Ciliated embryo of *Podophrya Stentii*, Cl. and L.; $\times 300$. 11. *Acinetia grandis*, Saville Kent; $\times 100$; showing pedunculated lorica, and animal with two bunches of entirely suckorial tentacles. *a*, nucleus. 12. *Sphaerophrya magna*, Maupas; $\times 300$. It has seized with its tentacles, and is in the act of sucking out the juices of six examples of the ciliate *Colpoda parvifrons*. 13. *Podophrya elongata*, Cl. and L.; $\times 150$. *a*, nucleus; *b*, contractile vacuole. 14. *Hemio-phrya Benedenti*, Fraip. $\times 200$; the suckorial tentacles retracted. 15. *Dendrocometes paradoxus*, Stein; $\times 350$. Parasitic on *Gammarus pulex*. *a*, nucleus; *b*, contractile vacuole; *c*, cap-

tured prey. 16. A single tentacle of *Podophrya*; $\times 800$, (Saville Kent.) 17–20. *Dendrosoma radicans*, Ehr.;—17, free-swimming ciliated embryo, $\times 600$; 18, earliest fixed condition of the embryo, $\times 600$; 19, later stage, a single tentaculiferous process now developed, $\times 600$; 20, adult colony; *c*, enclosed ciliated embryos; *d*, branching stolon; *e*, more minute reproductive (?) bodies. 21. *Ophryodendron pedicellatum*, Hincks; $\times 300$.

warts containing a portion of the branched parental nucleus are nipped off from the parent, often simultaneously (Fig. XXVI. 8). These do not become altogether distinct, but are for a time enclosed by the parental cell each in a sort of vacuole or brood-chamber, where the young Acinetarian develops a coat or band of cilia and then escapes from the body of its parent (Fig. XXVI. 10, 17). After a brief locomotive existence, it becomes sedentary, develops its tentacles, and loses its cilia.

The Acinetaria have one or more contractile vacu-oles. Their nutrition is holozoic.

The surface of the body in some cases is covered only by a delicate cuticle, but in other cases a definite membranous shell or cup (often stalked) is produced. Fresh-water and marine. See Fraipont (89).

ORDER 1. SUCTORIA, Kent.

A greater or less proportion or often all of the tentacles are suckorial and terminated with sucker-like expansions.

Genera.—*Rhyncheta*, Zenker (stalkless, naked, with only one tentacle; epizoid on Cyclops; Fig. XXVI. 1); *Urnula*, C. and L.; *Sphaerophrya*, C. and L. (naked, spherical, with distinctly capitate tentacles only; never with a pedicle; parasitic within Ciliata, supposed young; Fig. XXVI. 2–6, 12); *Trichophrya*, C. and L. (as *Sphaerophrya*, but oblong and temporarily fixed without a pedicle); *Podophrya*, Ehr. (naked, solitary, globose, ovate or elongate, fixed by a pedicle; tentacles all suckorial, united in fascicles or distributed irregularly; Fig. XXVI. 10, 13, 16); *Hemio-phrya*, S. Kent (as *Podophrya*, but the tentacles are of the two kinds indicated in the definition of the group; Fig. XXVI. 8, 9, 14); *Podocorythus*, S. Kent (secreting and inhabiting stalked membranous cups or loricae; tentacles of the two kinds); *Solenophrya*, C. and L. (with a sessile lorica; tentacles only suckorial); *Acinetia*, Ehr. (as *Solenophrya*, but the lorica is supported on a pedicle; Fig. XXVI. 11); *Dendrocometes*, Stein (cuticle indurated; solitary, sessile, discoid; tentacles peculiar, viz., not contractile, more or less branched, rootlike, and perforated at the extremities and suckorial in function; Fig. XXVI. 15). *Dendrosoma*, Ehr. (forming colonies of intimately fused individuals, with a basal adherent protoplasmic stolon and upstanding branches, the termination of which bear numerous capitate suckorial tentacles only; Fig. XXVI. 17–20).

ORDER 2. NON-SUCTORIA, Lankester (=Actinaria, Kent).

Characters.—Tentacles filiform, prehensile, not provided with a sucker.

Genera.—*Ephelota*, Str. Wright (solitary, naked, pedunculate, with many flexible inversible tentacles); *Actinocyathus*, S. Kent; *Ophryodendron*, C. and L. (sessile, with a long, extensible, anterior proboscis bearing numerous flexible tentacles at its distal extremity; Fig. XXVI. 21); *Acinetopsis*, Robin (ovate, solitary, secreting a stalked lorica; from the anterior extremity of the animal is developed a proboscis-like organ which does not bear tentacles).

Further remarks on the Acinetaria.—The independence of the Acinetaria was threatened some years ago by the erroneous view of Stein (79) that they were phases in the life history of Vorticellidae. Small parasitic forms (*Sphaerophrya*) were also until recently regarded erroneously as the "acinetiform young" of Ciliata.

They now must be regarded as an extreme modification of the Protozoan series, in which the differentiation of organs in a unicellular animal reaches its highest point. The sucker-tentacles of the Suctoria are very elaborately constructed organs (see Fig. XXVI. 16). They are efficient means of seizing and extracting the juices of another Protozoan which serves as food to the Acinetarian. The structure of *Dendrosoma* is remarkable on account of its multicellular character and the elaborate differentiation of the reproductive bodies.

The ciliation of the embryos or young forms developed from the buds of Acinetaria is an indication of their ances-

tral connection with the Ciliata. The cilia are differently disposed on the young of the various genera (see Fig. XXVI. 10, 17).

PROUDHON, PIERRE JOSEPH (1809-1865), a well-known revolutionary writer, was born in 1809 at Besançon, France, the native place also of the socialist Fourier. His origin was of the humblest, his father being a brewer's cooper; and the boy herded cows and followed other simple pursuits of a like nature. But he was not entirely self-educated; at sixteen he entered the college of his native place, though his family was so poor that he could not procure the necessary books, and had to borrow them from his mates in order to copy the lessons. There is a story of the young Proudhon returning home laden with prizes, but to find that there was no dinner for him. At nineteen he became a working compositor; afterwards he rose to be a corrector for the press, reading proofs of ecclesiastical works, and thereby acquiring a very competent knowledge of geology. In this way also he came to learn Hebrew, and to compare it with Greek, Latin and French; and it was the first proof of his intellectual audacity that on the strength of this he wrote an "Essai de grammaire générale." As Proudhon knew nothing whatever of the true principles of philology, his treatise was of no value. In 1833 he obtained the *pension Suard*, a bursary of 1500 francs a year for three years, for the encouragement of young men of promise, which was in the gift of the academy of Besançon. In 1839 he wrote a treatise "On the Utility of Keeping the Sunday," which contained the germs of his revolutionary ideas. About this time he went to Paris, where he lived a poor, ascetic and studious life—making acquaintance, however, with the so-

cialistic ideas which were then fomenting in the capital. In 1840 he published his first work *Qu'est-ce que la Propriété?* His famous answer to this question, "La propriété, c'est le vol," naturally did not please the academy of Besançon, and there was some talk of withdrawing his *pension*; but he held it for the regular period. For his third memoir on property, which took the shape of a letter to the Fourierist, M. Considérant, he was tried at Besançon but was acquitted. In 1846 he published his greatest work, the *Système des contradictions économiques ou Philosophie de la Misère*. For some time Proudhon carried on a small printing establishment at Besançon, but without success; afterwards he became connected as a kind of manager with a commercial firm at Lyons. In 1847 he left this employment, and finally settled in Paris, where he was now becoming celebrated as a leader of innovation. He regretted the sudden outbreak of the revolution of February (1848), because it found the social reformers unprepared. But he threw himself with ardor into the conflict of opinion, and soon gained a national notoriety. He was the moving spirit of the *Représentant du Peuple* and other journals, in which the most advanced theories were advocated in the strongest language; and as member of assembly for the Seine department he brought forward his celebrated proposal of exacting an impost of one-third on interest and rent, which of course was rejected. His attempt to found a bank which should operate by granting gratuitous credit was also a complete failure; of the five million francs which he required only seven-

teen thousand were offered. The violence of his utterances led to an imprisonment at Paris for three years, during which he married a young working woman. As Proudhon aimed at economic rather than political innovation, he had no special quarrel with the second empire, and he lived in comparative quiet under it till the publication of his work, *De la Justice dans la Révolution et dans l'Église* (1858), in which he attacked the church and other existing institutions with unusual fury. This time he fled to Brussels to escape imprisonment. On his return to France his health broke down, though he continued to write. He died at Passy in 1865.

Personally Proudhon was one of the most remarkable figures of modern France. His life was marked by the severest simplicity and even Puritanism; he was affectionate in his domestic relations, a most loyal friend, and strictly upright in conduct. He was strongly opposed to the prevailing French socialism of his time because of its utopianism and immorality; and, though he uttered all manner of wild paradox and vehement invective against the dominant ideas and institutions, he was remarkably free from feelings of personal hate. In all that he said and did he was the son of the people, who had not been broken to the usual social and academic discipline; hence his roughness, his one-sidedness, and his exaggerations; but he is always vigorous, and often brilliant and original.

It would of course be impossible to reduce the ideas of such an irregular thinker, to systematic form. In later years Proudhon himself confessed that "the great part of his publications formed only a work of dissection and ventilation, so to speak, by means of which he slowly makes his way towards a superior conception of political and economic laws." Yet the groundwork of his teaching is clear and firm; no one could insist with greater emphasis on the demonstrative character of economic principles as understood by himself. He strongly believed in the absolute truth of a few moral ideas, with which it was the aim of his teaching to mould and suffuse political economy. Of these fundamental ideas, justice, liberty, and equality were the chief. What he desiderated, for instance, in an ideal society was the most perfect equality of remuneration. It was his principle that service pays service, that a day's labor balances a day's labor—in other words, that the duration of labor is the just measure of value. He did not shrink from any of the consequences of this theory, for he would give the same remuneration to the worst mason as to a Phidias; but he looks forward also to a period in human development when the present inequality in the talent and capacity of men would be reduced to an inappreciable minimum. From the great principle of service as the equivalent of service is derived his axiom that property is the right of *aubaine*. The *aubain* was a stranger not naturalized; and the right of *aubaine* was the right in virtue of which the sovereign claimed the goods of such a stranger who had died in his territory. Property is a right of the same nature, with a like power of appropriation in the form of rent, interest, etc. It reaps without labor, consumes without producing, and enjoys without exertion. Proudhon's aim, therefore, was to realize a science of society resting on principles of justice, liberty, and equality thus understood; "a science absolute, rigorous, based on the nature of man and of his faculties, and on their mutual relations; a science which we have not to invent, but to discover." But he saw clearly that such ideas with their necessary accompaniments could only be realized through a long and laborious process of social transformation. As we have said, he strongly detested the purient immorality of the schools of Saint-Simon and Fourier. He attacked them not less bitterly for thinking that society could be changed off-hand by a ready-made and complete scheme of reform. It was "the most accursed lie," he said, "that could be offered to mankind." In social change he distinguishes between the transition and the perfection or achievement. With regard to the transition he advocated the progressive abolition of the right of *aubaine*, by reducing interest, rent, etc. For the goal he professed only to give the general principles; he had no ready-made scheme, no utopia. The positive organization of the new society in its details was a labor that would require fifty Montesquieus. The organization he desired was one on collective principles, a free association which would take account of the division of labor, and which would maintain the personality both of the man and the citizen. With his strong and fervid feeling for human dignity and liberty, Proudhon could not have tolerated any theory of social change that did not give full scope for the free development of man. Connected with

this was his famous paradox of *anarchy*, as the goal of the free development of society, by which he meant that through the ethical progress of men government should become unnecessary. "Government of man by man in every form," he says, "is oppression. The highest perfection of society is found in the union of order and *anarchy*."

Proudhon's theory of property as the right of *aubaine* is substantially the same as the theory of capital held by Marx and most of the later socialists. Property and capital are defined and treated as the power of exploiting the labor of other men, of claiming the results of labor without giving an equivalent. Proudhon's famous paradox, "*La propriété, c'est le vol*," is merely a trenchant expression of this general principle. As slavery is assassination inasmuch as it destroys all that is valuable and desirable in human personality, so property is theft inasmuch as it appropriates the value produced by the labor of others in the form of rent, interest, or profit without rendering an equivalent. For property Proudhon would substitute individual possession, the right of occupation being equal for all men (see SOCIALISM).

The principal works of Proudhon have already been mentioned. A complete edition, including his posthumous writings was published at Paris, 1875. See P. J. Proudhon, *sa vie et sa correspondance*, by Sainte-Beuve (Paris, 1875), an admirable work, unhappily not completed; also *Revue des Deux Mondes*, Jan., 1866, and Feb., 1873. (T. K.)

PROUT, SAMUEL (1783–1852), water-color painter, was born at Plymouth on September 17, 1783. His education in art was obtained by a patient and enthusiastic study of nature. He spent whole summer days, in company with the ill-fated Haydon, in drawing the quiet cottages, rustic bridges, and romantic water-mills of the beautiful valleys of Devon. He even made a journey through Cornwall, to try his hand in furnishing sketches for Britton's *Beauties of England*. On his removal in 1803 to London, which became his headquarters after 1812, a new scene of activity opened up before Prout. He now endeavored to correct and improve his style by the study of the works of the rising school of landscape. To gain a living he painted marine pieces for Palsar the printseller, received pupils, and published many drawing books for learners. He was likewise one of the first who turned to account in his profession the newly-invented art of lithography. In spite of all this industry, however, it was not until about 1818 that Prout discovered his proper sphere. Happening at that time to make his first visit to the Continent, and to study the quaint streets and market-places of Continental cities, he suddenly found himself in a new and enchanting province of art. All his faculties, having found their congenial element, sprung into unwonted power and activity. His eye readily caught the picturesque features of the architecture, and his hand recorded them with unsurpassed felicity and fine selection of line. The composition of his drawings was exquisitely natural; their color exhibited "the truest and happiest association in sun and shade"; the picturesque remnants of ancient architecture were rendered with the happiest breadth and largeness, with the heartiest perception and enjoyment of their time-worn ruggedness; and the solemnity of great cathedrals was brought out with striking effect. Encouraged by this success, Prout continued most enthusiastically to pursue that path upon which he had unexpectedly come. At the time of his death, 10th February, 1852, there was scarcely a nook in France, Germany, Italy, and the Netherlands where his quiet, benevolent, observant face had not been seen searching for antique gables and sculptured pieces of stone. In Venice especially there was hardly a pillar which his eye had not lovingly studied and his pencil had not dexterously copied.

See a memoir of Prout, by John Ruskin, in *Art Journal* for 1849, and the same author's *Notes on the Fine Art Society's Loan Collection of Drawings by Samuel Prout and William Hunt*, 1879–80.

PROVENÇAL LANGUAGE AND LITERATURE. I. LANGUAGE.—Provençal is a name used to comprehend all the varieties of Romanic speech for-

merly spoken and written, and still generally used by country people, in the south of France. The geographical limits of this infinitely varied idiom cannot be defined with precision, because it is continuous on the north, south, and east with idioms of the same family, with which almost at every point it blends by insensible gradations. Roughly speaking, it may be said to be contained between the Atlantic on the west, the Pyrenees and Mediterranean on the south, and the Alps on the east, and to be bounded on the north by a line proceeding from the Gironde to the Alps, and passing through the departments of Gironde, Dordogne, Haute Vienne, Creuse, Alliere, Loire, Rhone, Isère, and Savoie. These limits are to some extent conventional. True, they are fixed in accordance with the mean of linguistic characters; but it is self-evident that according to the importance attached to one character or another they may be determined differently.

1. *Different Names.*—Though the name Provençal is generally adopted to designate the Romanic idiom of this region, it must not be supposed that this name has been imposed by general *consensus*, or that it rests upon any very firm historical basis. In the southern part of Gaul, Romanic developed itself, so to say, in the natural state of language. Contrary to what took place in other Romanic countries, no local variety here raised itself to the rank of the literary idiom *par excellence*. While in Italy the Florentine, in France the French dialect proper (that is to say, the dialect of the Île de France), succeeded little by little in monopolizing literary use, to the exclusion of the other dialects, we do not find that either the Marseillais or the Toulousain idiom was ever spoken or written outside of Marseilles or Toulouse. In consequence of this circumstance, no name originally designating the language of a town or of a small district came to be employed to designate the language of the whole of southern France; and on the other hand the geographical region described above, having never had any special name, was not able to give one to the idiom.

In the Middle Ages the idiom was spoken of under various appellations: *Romans* or *lenga Romana* was that most generally used. It is notably that employed by the authors of the *Leys d'Amors*, a treatise on grammar, poetry, and rhetoric, composed at Toulouse in the 14th century. But this term, which is capable of being applied, and which, in fact, has been applied, to each of the Romanic languages individually, is too general to be retained. It is, however, that which was revived in the beginning of the present century by Raynouard, the author of the *Lexique roman*. It is now abandoned. In the 13th century a poet born in Catalonia, on the southern slope of the Pyrenees, Raimon Vidal of Besalù, introduced the name of *Limousin* language, probably on account of the great reputation of some Limousin troubadours, but he took care to define the expression, which he extended beyond its original meaning, by saying that in speaking of *Limousin* he must be understood to include Saintonge, Quercy, Auvergne, etc. (*Rasos de trobar*, ed. Stengel, p. 70). This expression found favor in Spain, and especially in Catalonia, where the little treatise of Raimon Vidal was extensively read. The most ancient lyric poetry of the Catalans (13th and 14th centuries), composed on the model of the poetry of the troubadours, was often styled in Spain *poesia lemosina*, and in the same country *lengua lemosina* long designated at once the Provençal and the old literary Catalan.

The name Provençal as applied to language is hardly met with in the Middle Ages, except in the restricted sense of the language of Provence proper, *i.e.*, of the region lying south of Dauphiné on the eastern side of the Rhone. Raimon Feraut, who composed, about 1300, a versified life of St. Honorat, uses it, but he was himself a native of Provence. We can also cite the title of a grammar, the *Donatz Proensals*, by Hugh Faidit (about 1250); but this work was composed in north Italy, and we may conceive that the Italians liv-

ing next to Provence employed the name Provençal somewhat vaguely without inquiring into the geographical limits of the idiom so called. In fact the name Provençal became traditional in Italy, and in the beginning of the 16th century Bembo could write, "Era per tutto il Ponente la favella *Provenzale*, ne tempi ne quali ella fiori, in prezzo et in istima molta, et tra tutti gli altri idiomi di quelle parti, di gran lunga primiera. Conciosiacosa che ciascuno, o Francese, o Fiamingo, o Guascone, o Borgognone, o altramente di quelle nationi che egli si fosse, il quale bene scrivere e specialmente verseggiar volesse, quantunque egli Provenzale non fosse, lo faceva Provenzalmente" (*Prose*, ed. 1529, fol. viii.).¹ This passage, in which the primacy of the Provençal tongue is manifestly exaggerated, is interesting as showing the name Provençal employed, though, with little precision, in the sense in which we now apply it.

Another designation, which is supported by the great authority of Dante, is that of *langue d'oc*. In his treatise *De Vulgari Eloquentia* (bk i. chaps. viii. and ix.), the Florentine poet divides the languages of Latin origin into three idioms, which he characterizes by the affirmative particles used in each *oc, oïl, si*; "nam alii *oc*, alii *oïl*, alii *si* affirmando loquuntur, ut puta Hispani, Franci, et Latini." As is seen, he attributes the affirmation *oc* to the Spaniards, which is of course erroneous, but there is no doubt that to the Spaniards he joined more correctly the inhabitants of southern France, for in the *Vita nuova*, chap. xxv., he speaks of the *lingua d'oc* as having been long celebrated for its poets, which can apply only to the language of the troubadours. The name *langue d'oc* occurs also as early as the end of the 13th century, in public acts, but with a different sense, that of the province of Languedoc, as constituted after the union of the county of Toulouse to the French king's dominion in 1271. In the royal acts of the end of the 13th and of the 14th century *partes lingue occitanæ* or *pays de langue d'oc* designates the union of the five seneschalates of Périgieux, Carcassone, Beaucaire, Toulouse, and Rhodéz, that is to say, the province of Languedoc, such as it existed till 1790. Some scholars, following the example of Dante, still actually use the term *langue d'oc* in opposition to *langue d'oïl*, but these names have the inconvenience that they take such a secondary fact as the form of the affirmative particle as an essential character. Moreover it can hardly help to distinguish the other Romanic languages, as *langue de si* would cause a confusion between Italian and Spanish. Provençal, without being entirely satisfactory, since in principle it applies solely to the language of Provence, is, notwithstanding, the least objectionable name that can be adopted. In addition to its being in some sort consecrated by the use made of it by the Italians, who were the first after the Renaissance to study the works of the troubadours, it must not be forgotten that, just as the Roman *Provincia*, in which the name originated, extended across the south of Gaul from the Alps to Toulouse and the Pyrenees, so still in the Middle Ages *Provincia, Provinciales*, were understood in a very wide sense to designate not only Provence strictly so called, *i.e.*, the present departments of Alpes Maritimes, Basses Alpes, Var, Bouches du Rhône, but also a very considerable part of Languedoc and the adjacent countries. Thus in the 12th century the chronicler Albert of Aix-la-Chapelle (Albertus Aqueusis) places the town of Puy (Haute Loire) in *Provincia*.

2. *General Characters of the Language in its Ancient State.*—The Provençal language, within the limits above indicated, cannot be said to have any general characters really peculiar to it. Such of its characters

¹ "The Provençal speech in the times in which it flourished was prized and held in great esteem all over the West, and among all the other idioms of that region was by far the foremost: so that every one, whether Frenchmen, Fleming, Gascon, Burgundian, or of what nation soever, who wished to write and versify well, although he was not a Provençal, did it in the Provençal language."

as are found in all the varieties of the language are met with also in neighboring idioms; such as are not found elsewhere are not general characters, that is to say, are manifested only in certain varieties of Provençal. In reality "Provençal language" does not designate, properly speaking, a linguistic unity; it is merely a geographical expression.

Tonic or Accented vowels.—Latin *a* is preserved in an open syllable *amāre*, *amar*, *amātum*, *amat*, as well as in a closed syllable *carne m*, *car n*. This character is common also to the Romanic of Spain and Italy; but it is one of the best distinguishing marks between Provençal and French, for, to the north, this *a*, when in an open syllable, does not pass beyond a line which would run approximately through Blaye, Coutras (Gironde), Ribérac, Nontron (Dordogne), Bellac (Haute Vienne), Boussac (Creuse), Montluçon, Gannat (Allier), Montbrison (Loire). Starting eastward from Lyons or thereabouts, there appears a notable linguistic fact which is observable in varied proportions in the departments of Ain, Isère, and Savoie, and in Romanic Switzerland. This is, that accented Latin *a* in an open syllable, when preceded by a *mouillure* or palatalization (whatever the origin of this), becomes *e*; on the contrary, when there is no *mouillure*, it remains *a*. Thus we find in the *Méditations* of Marguerite d'Oingt (Lyons, about 1300) *ensennier*, *deleitier*, as against *desirrar*, *recontar*, *regardar*. Of these two endings, the former, *-ier*, is that which is found regularly in French, the second that which is regular in Pr. Pure Pr. would have *-ar* in both cases (*ensenhar*, *deleitar*, *desirrar*, etc.); Fr. would have *-ier* (*enseigner*, *deleitier*) and *-er* (*desirer*). Prof. Ascoli has given the name of *Franco-provençal* (*franco-provenzale*) to the varieties of Romanic in which we find this duality of treatment of Latin *a*, according as it was or was not preceded by a palatalized sound. Lat. *ē*, *ī* become close *e* (Ital., *e chiuso*; Fr. *é*): *habēre aver*, *crēdet ere*, *mē(n)sem mes*, *fīdē m fe*, *pīlū m pel*. This character is not only common to Italian and Spanish, but also extends over the French domain on its western side as far as Brittany. Certain exceptions noticed in French do not occur in Pr.: thus *mercēdem*, *cēra*, *pr(ēh)ē(n)sūm*, *venēnūm*, which give in Fr. *merci*, *cire*, *pris*, *venin*, where we should have expected *mercei*, *ceire*, *preis*, *venein*, give regularly in Pr. *merce*, *cera*, *pres*, *vere*. Lat. *ē* preserves, as in Italy, the sound of open *e* (Ital., *e aperto*): *pēdē m*, *pē*, *lēvāt*, *leva*, *lēpōrē m*, *lebre*. In certain determinate cases, this *e* from about the 13th century onwards may diphthongize to *ie*: *ēgo*, *eu* then *ieu*, *hēri*, *er*, *ier*, *fērit*, *fer*, *fier*. Lat. *ī* is preserved, as in all the Romanic languages: *amicū m*, *ami*, *ripa*, *riba*. Lat. *ī* is treated like *i* long when it precedes (with hiatus) another vowel: *pīū m*, *pīa*, *pīu*, *pīa*, *vīa*, *via*, *ligāt*, *lia*. Lat. *ō*, *ū* result in one and the same sound, that of Italian *u*, Fr. *ou* (Eng. *oo*). The same phenomenon takes place in the north of Italy, and in the Romanic of Switzerland. This sound, which is styled by the *Donat Proensals* the *o estreit* (close *o*), is usually symbolized in the early texts by simple *o*, and is thus confounded in spelling, though not in pronunciation, with the open *o* (*olarc* of the *Donatz Proensals*) which comes from Lat. *ō*. Lat. *ū* becomes *u* (i.e., Fr. *u*), as all over France, and also in North Italy and Catalonia: *mūru m*, *mūr* (=mūr), *dūru m*, *dūr* (=dūr). Lat. *au* is rigorously preserved over the whole extent of the Pr. domain: *aūru m*, *aur*, *alauda*, *alauza*, *paupere m*, *paubre*. At present the preservation of Lat. *au* does not extend much outside the Prov. domain; it is, however, found in certain parts of the Ladino zone in Switzerland (upper Rhine Valley), and in Friuli, and it is to be supposed to have been once general over the whole of that zone. It is attested as late as the 16th century in the Vaudois valleys of Piedmont, and there are also examples of it in old Catalan. Elsewhere the diphthong has regularly become open *o* (*aūru m*, It. and Sp. *oro*, Fr. *or*, etc.).

Atonic Vowels.—The atonic vowels (i.e., vowels of the unaccented syllables) which precede the accented syllable present no very characteristic phenomenon; but it is otherwise with those that follow the accented syllable, the *post-tonic* vowels. The Pr. is one of the Romanic idioms which, like the French, but unlike the Castilian and the dialects of central and northern Italy, admit of only one syllable after the accent. But the rules are not quite the same as in French. In French the only vowel which can stand after the accented syllable is "e feminine," otherwise called "e mute." In Prov. *a* and *e* are the most frequent vowels in this position, but *i* and *o* also occur. In French the first of the two post-tonic vowels of a Lat. proparoxytone always disappears; in Prov. it tends to be preserved, when followed by one of the consonants *n*, *r*, *l*, *d*: *terminū m*, *ter'men*, *hōm in em*, *ō'men*, *angelū m*, *angel*, *sēcale m*, *se'guel*, *cre'scere*, *crei'sser*, *te'pidū m*, *te'bez*. Finally,

Prov. presents in certain words coming from Lat. proparoxytones the trace of forms which (like Ital.) admitted two atonic vowels after the accented syllable: thus we have *porte'que* and *po'rgue* (*pōrticū m*), *Fabre'ga*, a place name, and *fa'rga* (*fab'rica*), *perte'ga* and *pe'rga* (*pērtica*), *feme'na* and *fe'mna* (*fēmina*). We have also *lagre'ma* (*lācry m a*), but a form accented like Fr. *larme* does not exist. There seems to be no doubt that these forms in which a displacement of the Latin accent is observed were at an earlier period pronounced as proparoxytones (*po'rte'que*, *fa'b're'ga*, *pe'r'te'ga*, *fe'm'na*, *la'gre'ma*).

Consonants.—The boundary usually recognized between Prov. and French is founded upon linguistic characters furnished by the vowels, especially *a*; if it had been determined by characters furnished by the consonants, the line of demarcation would have to be drawn farther south, because the consonantal system which is regarded as proper to French really extends in its main features over the northern zone of the Provençal region as defined above. As with the vowels, only a few of the salient facts can here be indicated. *C* initial, or second consonant of a group, before *a* (*ca ballū m*, *me reātū m*), preserves its Lat. sound (=k) in the greater part of the Prov. region. But in the northern zone it takes the sound of *ch* (Eng. *ch* in *chin*) as in O. Fr., and this sound is still pretty well preserved, although there is here and there a tendency to the present sound of *ch* in Fr. (=sh Eng.). The place names *Castellū m*, *Castanētū m*, *Casale*, give *Chastel*, *Chastanet*, *Chazal*, in Dordogne, Haute Vienne, Corrèze, Puy de Dôme, Cantal, Haute Loire, the north of Lozère, of Ardèche, of Drome, of Isère, and of Hautes Alpes, and *Castel*, *Castanet*, *Cazal*, farther to the south. Analogously, *g* initial, or second consonant of a group, followed by *a*, becomes *j* (i.e., *dah*=O. Fr. and Eng. *j* in *jam*) in the same zone; *Garrica* is *Jarrija*, *Jarria* in Dordogne, Corrèze, Cantal, Haute Loire, Isère, and *Garriga* farther south. Between two vowels *t* becomes *d*: *edat*, *emperador*, *nadal*, *amada* (*ætatem*, *imperatorē m*, *natāle*, *āmāta*). This was also the case in O. Fr. until the course of the 11th century (*honurede*, *emperedur*, *lavadures*, etc., in the *Life of St. Alexis*). But in the northern zone this *d* representing a Lat. *t* fell away as early as in Fr.; in an 11th-century text from the environs of Valence, we read *muraor*, *coroaa* (**muratōrē m*, *corogāta*), Fr. *corvée* (P. Meyer, *Recueil d'anciens textes*, Provençal section, No. 40). In the south, *d* between two vowels was preserved almost everywhere until about the middle of the 12th century, when it became *z* (as in Fr. and Eng. *zero*): *cruzal*, *azorar*, *auzir*, *cezer* (*crudēlem*, *adorāre*, *audire*, *vidēre*). In the 14th and 15th centuries this *z*, like every *z* or *s* soft of whatever origin, was liable to become *r* (lingual, not uvular): *aurir*, *veren* (*audire*, *videntem*). In Béarn and Gascony *d* remained; but in the northern zone Lat. *d*, instead of changing into *z*, *r*, disappeared as in Fr. and quite as early. The poem of Boetius, of which the MS. is of the 11th century, shows in this respect great hesitation: e.g., *d* preserved in *chaden*, *credet*, *tradar*, *veder* (*cadentem*, **credēdit*, **tradāre*, *vidēre*); *d* fallen away in *creessen*, *feeltat*, *traazo*, *veūt*, *fiar* (**credessent*, *felicitātem*, **traditionem*, **vidūtum*, p. ple. of *vidēre*, *fidāre*). One of the most general facts in Pr. is the habit of rejecting Lat. final *t*, of which examples to any number are presented by the verbs. In Fr. this *t* was formerly retained when it followed a vowel which remained, *aimet*, *entret* (*amat*, *intrat*), and still remains (in writing at least) when, in Latin, it follows a consonant, *aiment*, *fait*, *vīt* (*amant*, *facit*, **fact*, *vivit*, **vīvt*); but in Pr. the *t* is dropped in all cases, even in the most ancient texts: *aman*, *fai*, *viu*. Yet in the northern zone we find the *t* retained in the 3d per. pl. of verbs, *-ant*, *-ont* (Lat. *-ant*, *-unt*). *H* has gone completely (or at least only appears through orthographic tradition, and very intermittently, (*herba*, (*honor*, (*humil*, etc., not only in words of Lat. origin, which is the case in O. Fr., but even in Teutonic words (*anta*, *ardit*, *arenc*, *ausberc*, *elm*, Fr. *honte*, *hardi*, *hareng*, *haubert*, *heaurme*, with *h* aspirated. By this feature, the northern limits of which are not yet well determined, the Provençal attaches itself to the Romanic of the southern countries. *N* final, or standing in Lat. between two vowels of which the second is to be dropped, disappears in the whole central part of the Pr. domain: *gran gra*, *ben be*, *en e*, *ven ve*, *fin fi*, *un u* (*granum*, *bene*, *in*, *venit*, *finem*, *unum*). The forms with *n* belong to the eastern part (left of the Rhone), the western part (Gascony, but not Béarn), and the region of the Pyrenees. It is possible that this loss of *n* went along with a lengthening of final vowel; at least, in Béarnese when the *n* falls away the vowel is doubled: *caperaa*, *besii*, *boo* (*capellānum*, *vicinum*, *bonum*), etc.

These are the most important characteristics of the consonants, in relation to the extent of space over which they

prevail. Others, which appear only within a more limited area, are perhaps more curious on account of their strangeness. It will suffice to mention a few which belong to the district bounded on the west and south by the Atlantic, the Basque provinces, and the Pyrenees, and which extends northward and eastward towards the Garonne and its affluents, as far as the Gironde. (This includes Béarn, Bigorre, and Gascony.) Here the sound *v* no longer exists, being replaced generally by *b*; between two vowels, in Gascony, by *u* with the sound of Eng. *w*. Initial *r* assumes a prosthetic *a*: *arram*, *arre*, *Arrobert* (rāmum, rem, Robertum). *Ll* between two vowels becomes *r*: *aperar*, *capéran*, or (Béarn) *capéran*, *bera*, *eru*, (apellare, capellanum, bella, ella). On the contrary, at the end of words (viz., in Romanic) *ll* becomes *g* or *t*, *d*: the former change seems to belong rather to Hautes et Basses Pyrénées, Landes, the latter to Gironde, Lot et Garonne, Gers: *eg*, *ed*, *et* (ille), *arrasteg*, *-ed*, *-et* (rastellum), *casteg*, *-ed*, *-et* (castellum), *capdeg*, *-ed*, *-et* (capitellum), whence Fr. *cadet* (in 16th century *capdêt*, originally a Gascon word). For further details upon the consonants in this region of southwest France, see Roumanian, iii. 435-38, v. 368-69.

Flexion.—Old Provençal has, like old French, a declension consisting of two cases for each number, derived from the Latin nominative and accusative. In certain respects this declension is more in conformity with etymology in Provençal than in old French, having been less influenced by analogy. The following are the types of this declension, taking them in the order of the Lat. declensions. 1. Words in *-a* coming from Lat. 1st decl., increased by certain words coming from Lat. neuter plurals treated in Prov. as feminine singulars; one form only for each number; sing. *causa*, pl. *causas*. 2. Words of the Lat. 2d decl., with a few from the 4th; two forms for each number; sing. subject *cavals* (caballus), object *caval* (caballum); pl. subject *caval* (caballi), object *cavals* (caballos). 3. Words of Lat. 3d decl. Here there are three Lat. types to be considered. The first type presents the same theme and the same accentuation in all the cases e.g., *canis*. The second presents the same accentuation in the nominative singular and in the other cases, but the theme differs: *co'mes*, *co'mitem*. In the third type the accentuation changes: *peccator*, *peccatōrem*. The first type is naturally confounded with nouns of the 2d decl.: sing. subj. *cans* or *cas*, obj. *can* or *ca*. The second and third types are sometimes followed in their original variety; thus *cons* answers to *co'mes*, and *co'mte* to *co'mitem*. But it has often happened that already in vulgar Latin the theme of the nominative singular had been refashioned after the theme of the oblique cases. They said in the nom. sing. *heredis*, *parentis*, *principis*, for *heres*, *parens*, *princeps*. Consequently the difference both of theme and of accentuation which existed in Lat. between nominative and accusative has disappeared in Pr. This reconstruction of the nominative singular after the theme of the other cases takes place in all Lat. words in *-as* (except *abbas*), in those in *-io*, in the greater part of those in *-or*, at least in all those which have an abstract meaning. Thus we obtain *bontatz* (*bonitatis* for *bonitas*) and *bontat* (*bonitatem*), *ciutatz* (*civitatis* for *civitas*) and *ciutat* (*civitatem*), *amors* (*amoris* for *amor*) and *amor* (*amorem*). All present participles in the subject case singular are formed in this way upon refashioned Latin nominatives: *amans* (*amantis* for *amans*) *amant* (*amantem*). It is to be remarked that in regard to feminine nouns Pr. is more etymological than Fr. In the latter feminine nouns have generally only one form for each number; *bonté* for the subj. as well as for the obj. case, and not *bontés* and *bonté*; in Pr. on the contrary *bontatz* and *bontat*. Still, in a large number of nouns the original difference of accentuation between the nominative singular and the other cases has been maintained, whence there result two very distinct forms for the subj. and obj. cases. Of these words it is impossible to give a full list here; we confine ourselves to the exhibition of a few types, remarking that these words are above all such as designate persons: *abàs abàt*, *pàstre pàstor*, *sor soror*, *cantàire cantador* (*cantator*, *-ōrem*), *emperàire emperador*, *bar baro*, *companh* *companion*, *lairo* *lairo* (*latro*, *-ōnem*). To this class belong various proper names: *Eble Eblo*, *Gui Guio*, *Uc Ugo*. A few have even come from the 2d decl., thus *Peire Peiro*, *Pons Ponso*, *Carle Carlo*, as if the Latin types had been *Petro*, *-ōnem*, *Ponso*, *-ōnem*, *Carlo*, *-ōnem*. We may mention also geographical adjectives, such as *Bret Breto*, *Bergonh* *Bergonho*, *Gasc Gasco*, etc. The plural of the 3d decl. is like that of the second: subj. *abàt*, *soro'r*, *cantado'r*, *emperado'r*, *baro*, *companho*, *lairo*; obj. *abàtz*, *soro'rs* *cantado'rs*, *emperado'rs* *baro's*, *companho's*, *lairo's*, as if the Lat. nominative pl. had been *abbàti*, *sorōri*, *cantatōri*, etc. It is barely possible that such forms actually existed in vulgar Latin; no trace of them, how-

ever, is found in the texts, save in the glosses of Cassel (8th c.), *sapienti* for *sapientes*, and in a great many ancient charters *parentorum*, which implies a nominative *parenti*. The words of the 4th and 5th declensions present no points requiring mention here.

This declension of two cases is a notable character of the whole Romanic of Gaul, north as well as south, i.e., French as well as Provençal. It must be noted, however, that in the southwest it existed only in a very restricted fashion. In the old texts of Gascony it is no longer general in the 13th century. In Béarn it appears to have been completely unknown, the nouns and adjs. having only one form, usually that of the obj. case. In Catalan poetry its application is often laid down in the 13th century, but as the charters and documents free from literary influence show no trace of it, its introduction into the poetry of this country may be assumed to be an artificial fact. In the region where it is best observed, i.e., in the centre and north of the Provençal territory, it tends to disappear from ordinary use already in the 13th century. The poet grammarian Raimon Vidal of Besalú, who flourished about the middle of the century, points out in various troubadours transgressions of the rules of declension, and recognizes that in conversation they are no longer observed. The general tendency was to retain only a single form, that of the obj. case. For certain words, however, it was the subj. form which survived. Thus in modern Pr. the words in the ending *-aire* (answering to Lat. *-ator*) are as frequent as those in *-adou* (repr. *-atōrem*). But there is a slight difference of meaning between these two suffixes.

Adjectives, generally speaking, agree in flexion with the nouns. But there is one fact particular to adjectives and past participles which is observed with more or less regularity in certain 12th and 13th century texts. There is a tendency to mark more clearly than in the substantives the flexion of the subj. pl., chiefly when the adj. or participle is employed predicatively. This is marked by the addition of an *i*, placed, according to the district, either after the final consonant, or else after the last vowel so as to form a diphthong with it. The following are examples from an ancient translation of the New Testament (MS. in library of the Palais Saint-Pierre, Lyons, end of 13th century): "*Dic a vos que no siatz consirois*" (ne solliciti sitis, Mat. vi. 25); "*que siatz visti d'els*" (ut videamini ab eis, Mat. vi. 1); "*e davant los reis eis princeps sereitz menadi*" (et ad præsides et ad reges ducemini, Mat. x. 18). In charters of the 12th and 13th centuries we find in the subj. case pl., and especially in this predicative use, *pagaig*, *certifiâi*, *acossailhâi*, representing *pagati*, *certificati*, *adconsiliati*.

It is in the verbs that the individuality of the different Romanic idioms manifests itself most distinctly. At a very early date the etymological data were crossed, in various directions and divers manners according to the country, by analogical tendencies. The local varieties became little by little so numerous in the Romanic conjugation that it is not easy to discover any very characteristic features observed over a territory so vast as that of which the limits have been indicated at the commencement of this article. The following are, however, a few.

The infinitives are in *-ar*, *-êr*, *-re*, *-ir*, corresponding to the Lat. *-are*, *-êre*, *-êre*, *-ire*, respectively; as in the whole Romanic domain, the conjugation in *-ar* is the most numerous. The table of verbs, which forms part of the Pr. grammar called the *Donatz Proensals* (13th century) contains 473 verbs in *-ar*, 101 in *-êr* and *-re*, 115 in *-ir*. In the *-ar* conjugation we remark one verb from another conjugation *far* (cf. It. *fare*) from *facere*. The conjugations in *-êr* and *-re* encroach each upon the territory of the other. The three Lat. verbs *cadêre*, *capêre*, *sapêre* have become *-êr* verbs (*cazêr*, *cabêr*, *sabêr*) as in Fr. *cheoir*, *cevoir*, *savoir*; and several other verbs waver between the two: *creder*, *creêr*, and *creîre* (*credêre*), *querer* and *querre* (*quærêre*). This fluctuation is most frequent in the case of verbs which belonged originally to the *êre* conjugation: *arder* and *ardre*, *plazer* and *plai're*, *tazêr* and *tai're* (*ardêre*, *placêre*, *tacêre*). Next to the *-ar* conjugation, that in *-ir* is the one which has preserved most formative power. As in the other Romanic languages, it has welcomed a large number of German verbs, and has attracted several verbs which etymologically ought to have belonged to the conjugations in *-êr* and *-re*: *emplir* (*implêre*), *jauzir* (*gaudêre*), *cosir* (*consuêre*), *eribir* (*eripêre*), *fugir* (*fugêre*), *sequir* (**sequêre*=*sequi*).

Except in the *-ar* conjugation, the ending of the infinitive does not determine in a regular manner the mode of forming the different tenses. The present participles are divided into two series: those in *-an* (obj. sing.) for the first conj., those in *-en* for the others. In this the Pr. distinguishes itself very clearly from the French, in which all

present participles have *-ant*. There is also in Pr. a participial form or verbal adjective which is not met with in any other Romanic language, except Romanian, where moreover it is employed in a different sense; this is a form in *-dōr*, *-dōira*, which supposes a Lat. type *-tōrius*, or *-tūrius*; the sense is that of a future participle, active for the intransitive verbs, passive for the transitive: *endeve-nido'r*, *-dōira*, "that is to happen"; *fuzedo'r*, *-dōira*, "that is to be done"; *punido'r*, *-dōira*, "to be punished." In conjugation properly so called, we may remark the almost complete disappearance of the Lat. preterite in *-āvī*, of which traces are found only in texts written in the neighborhood of the French speaking region, and Béarn. In return, a preterite which seems to have been suggested by the Latin *dēdi*, has increased and become the type of the tense almost everywhere in the *-ar* conjugation, and in many verbs in *-ēr* and *-re*: *amei*, *ame'st*, *ame't*, *ame'm*, *ame'tz*, *ame'ron*. In Fr. there is a form like this, or at least having the same origin, only in a small number of verbs, none of which belong to the first conjugation, and in these only in the 3rd. pers. sing. and pl. (*perdiē perdiērent*; *entendiē, entendierent*, etc.). It is well known that reduplicated preterites had greatly multiplied in vulgar Latin: there have been recovered such forms as *ascendiderat*, *ostendedit*, *pandiderunt*, *adattendit*, *incendiderat*, etc. (see Schuchardt, *Vokalismus des Vulgarlateins*, i. 35, iii. 10; cf. *Romania*, ii. 477). But, in order to explain the Pr. form *-ei*, *-est*, *-et* (with open *è*), we must suppose a termination not in *-īdi* or *-ēdi*, but in *-ēdi*. In the western region the 3d pers. sing. is generally in *-ec*, probably by analogy with preterites like *bec*, *crec*, *dec*, *sec*, formed after the Lat. type in *-ui*. Another notable peculiarity, of which Old Fr. shows only rare traces, in texts of a very remote period, is the preservation of a preterite in *-ara*, or *-era*, derived from the Lat. pluperfect, *amāra* or *amēra*, "I loved." The former comes directly from Lat. *amāram*, the latter has been influenced by the ordinary preterite in *-ei*. This preterite is used with the sense of a simple past, not of a pluperfect, and consequently is an exact doublet of the ordinary preterite, which explains how it was at length eliminated almost everywhere by the latter, of which it was a mere synonym. But it remained in general use with the sense of a past conditional: *amāra* or *amēra*, "I should have loved," *fora*, "I should have been."

3. *Existing State of the Provençal.*—In consequence of political circumstances (see notice of Provençal Literature below), the Provençal ceased to be used for administrative as well as literary purposes about the 15th century, in some places a little sooner, in others later (notably in Béarn, where it continued to be written as the language of ordinary use till the 17th century). The poems in local dialect composed and printed in the 16th century and on to our own day have no link with the literature of the preceding period. Reduced to the condition of a *patois*, or popular dialect simply, the idiom experienced somewhat rapid modifications. Any one who should compare the poems of Goudelin of Toulouse (1579-1649) with those of a Toulousain troubadour of the 13th century would be astonished at the changes which the language has undergone. Yet this impression would probably be exaggerated. In order to make a rigorously accurate comparison of the language of the two epochs, it would have to be written in the two cases with the same orthographic system, which it is not. The first writers of Provençal, about the 10th or 11th century, applied to the language the Latin orthography, preserving to each letter, as far as possible, the value given to it in the contemporary pronunciation of Latin. To express certain sounds which did not exist in Latin, or which were not there clearly enough noted, there were introduced little by little, and without regular system, various conventional symbolizations such as *lh* and *nh* to symbolize the sound of *l* and *n* *mouillée*. From this method of proceeding there resulted an orthographic system somewhat wanting in fixity, but which from its very instability lent itself fairly well to the variations which the pronunciation underwent in time and locality. But, the tradition having been interrupted about the 15th century, those who afterwards by way of pastime attempted composition in the *patois* formed, each for himself apart, an orthography of which many elements were bor-

rowed from French usage. It is evident that differences already considerable must be exaggerated by the use of two very distinct orthographical systems. Nevertheless, even if we get quit of the illusion which makes us at first sight suppose differences of sound where there are merely different ways of spelling the same sound, we find that between the 14th and 16th century the language underwent everywhere, Béarn (for reasons already given) excepted, great modifications both in vocabulary and grammar. The Provençal literature having gradually died out during the 14th century, the vocabulary lost immediately the greater part of the terms expressing general ideas or abstract conceptions. To supply the place of these, the authors who have written in the *patois* of the south during the last few centuries have been obliged to borrow from French, modifying at the same time their form, a multitude of vocabularies which naturally have remained for the most part unintelligible to people who know only the *patois*. In this case the adoption of foreign words was excusable; but it did not stop here. Little by little, as primary instruction (now compulsory) was diffused, and introduced first in the towns and afterwards in the villages a certain knowledge of French, words purely French have been introduced into use in place of the corresponding dialect words. Thus, one hears constantly in Provence *pè'ro*, *mè'ro*, *frè'ro*, forms adapted from French, instead of *paire*, *maire*, *fraire*; *cacha* (*catsha* = Fr. *cacher*) instead of *escoundre*, etc.

In the phonology, the modifications are of the natural order, and so have nothing revolutionary. The language has developed locally tendencies which certainly already existed during the flourishing period, although the ancient orthography did not recognize them. Of the vowels, a tonic is generally preserved; *an* in an open syllable becomes *ò* (open) in part of the departments of Aveyron, Lot, Dordogne, Corrèze, Cantal, and south of Haute Loire: *gro* (*granum*), *mo* (*manum*), *po* (*panem*). This nasalized *a* must have had a particular sound already in Old Pr., for it is qualified in the *Donatz Proensals* (ed. Stengel, p. 49) as *a estreit* (= close or narrow *a*). A feature almost general is the passage of post-tonic *a* into *o*: *terro*, *amavo*, *amado* (*terra*, *amabat*, *amata*). In Var and the Maritime Alps examples of this change occur as early as the end of the 15th century. But even yet there are a few cantons, notably Montpellier and its neighborhood, where the ancient post-tonic *a* is preserved. It is remarkable that the Latin diphthong *au*, which had become simple *o* in almost all Romanic lands at the date of the most ancient texts, is to this day preserved with a very distinct diphthongal sound everywhere in the south of France.

In the morphology, the leading feature of modern Provençal is the ever greater simplification of grammatical forms. Not only have the two forms (nominative and objective) in each number, in nouns and adjectives, been reduced to one—this reduction manifested itself in ordinary use already in the 14th century—but in many places there no longer remains any distinction between the singular and the plural. In a great part of the south *ieu* (*ego*) does duty as an objective, *me* or *mi* having disappeared. In part of Drôme it is the other way, *mi* being substituted in the nominative for *ieu*, which it has completely displaced. It is perhaps in conjugation that the greatest changes from the older form of the language are seen. Analogy, basing itself upon one or another much used form, has acted with immense force, tending to make general in the whole conjugation, without any regard to the original classes to which the various verbs belonged, certain terminations, chiefly those which were accented, and thus appeared to the popular instinct to have more significance. The result, if the tendency were carried the full length, would be the reduction of all the three conjugations to one. Perhaps before this point is reached the *patois* of the south will themselves have disappeared. As the endless modifications which the language undergoes, in vocabulary and grammar alike, develop themselves in different directions, and each over an area differently circumscribed, the general aspect of the language becomes more and more confused, without the possibility of grouping the endless varieties within dialectal divisions, there being no case in which a certain number of phonetic or morphological facts present themselves within the same geographical limits. The custom has been adopted of roughly designating these varieties by the name of the ancient provinces in which they appear. *Limousin* (divided into *High* and *Low Li-*

mousin), *Marchese*, *Auvergnese*, *Gascon*, *Bearnese*, *Rouergat*, *Languedocian*, *Provençal*, etc.; but these divisions, though convenient in use, correspond to no actualities. Nîmes and Montpellier are in Languedoc, and Arles and Tarascon are in Provence; nevertheless the dialect of Nîmes resembles that of Arles and Tarascon more than that of Montpellier.

Texts.—For the history of the Provençal in all its varieties there are many more materials than for any other Romanic language, not excepting even Italian or French. The literary texts go back to the 10th or 11th century (see below). For phonetic purposes many of these texts are of secondary value, because the MSS. in which they have reached us, and several of which, especially for the poetry of the troubadours, are of Italian origin, have altered the original forms to an extent which it is not easy to determine; but we possess a countless number of charters, *coutumes*, regulations, accounts, registers of taxation, which are worthy of absolute confidence,—first, because these documents are in most cases originals, and, secondly, because, none of the dialectal varieties having raised itself to the rank of the literary language, as happened in France with the central (Parisian) variety and in Italy with the Florentine, writers never had the temptation to abandon their own idiom for another. It is proper to add that Provençal possesses two ancient grammars of the 13th century (the earliest compiled for any Romanic idiom)—the *Donatz Proençals* and *Razos de trobar* (see p. 901). Although very short, especially the second, which is a collection of detached observations, they furnish valuable data. The 14th-century *Leys d'Amors* (see p. 902) presents the language in rather an artificial state—the language which ought to be written rather than the language actually existing.

Bibliography.—1. *Ancient Condition.*—There does not exist any comprehensive work upon the Provençal whence to obtain a precise idea of the language at its different epochs. Diez's *Grammatik der romanischen Sprachen* is still the groundwork. It gives, especially in the 3d ed. (1869-72), the last revised by the author, the results of extensive researches conveniently arranged. But Diez had only a slender knowledge of the language in its present state, and in his time phonology had made little progress. The French translation of MM. G. Paris, A. Brachet, and Morel-Fatio (Paris, 1873-76) was to be completed by a supplementary volume, which was announced at vol. ix. p. 560 of the present work, but this expedient has had to be abandoned, it having been recognized that what was wanted was not a supplement but a general recast. The "*Recherches philologiques sur la langue romane*," and "*Résumé de la grammaire romane*," published by Raynouard at the beginning of vol. i. of his *Lexique roman* (1838), are entirely out of date. The "*Tableau sommaire des flexions provençales*," published by M. Bartsch, in the *Chrestomathie provençale* (4th ed., 1880), is incomplete and often erroneous. The actual state of our knowledge of ancient Provençal must be sought in a great number of scattered dissertations or monographs, which will be found especially in the *Mémoires de la Société de Linguistique de Paris*, 1868 (*Phonétique provençale*, O, pp. 145-61), in the *Romania* (1872-85), and in the *Revue de la Société pour l'étude des langues romanes*, to which may be added some doctoral dissertations published in Germany, and the special studies upon the language of particular texts prefaced to editions of these. As to dictionaries, the *Lexique roman, ou Dictionnaire de la langue des Troubadours*, by Raynouard (Paris, 6 vols. 8vo, 1836-44), can always be used with advantage, but the numerous special vocabularies appended by editors to texts published by them cannot be neglected. These yield a considerable number of words, either wanting or wrongly explained in the *Lexique roman*. 2. *Modern Form.*—The most useful grammatical works (all done with insufficient knowledge of phonology, and under the preconceived idea that there exist dialects with definite circumscription) are J. B. Andrews, *Essai de grammaire du dialecte mentonnais* (Mentone) (Nice, 1878), see also his "*Phonétique mentonnaise*," in *Romania*, xii. 394; Cantagrel, *Notes sur l'orthographe et la prononciation langue-dociennes*, prefixed to *La Canson de la Lauzeto*, by A. Mir (Montpellier, 1876); Chabaneau, *Grammaire limousine* (Paris, 1876), referring especially to the variety of Nontron, in the north of Périgord (Dordogne); Constans, *Essai sur l'histoire du sous-dialecte du Rouergue* (Montpellier and Paris, 1880); Lespy, *Grammaire béarnaise* (2d ed., Paris, 1880); A. Luchaire, *Études sur les idiomes pyrénéens de la région française* (Paris, 1879); Moutier, *Grammaire dauphinoise, Dialecte de la vallée de la Drôme* (Montelimar, 1882); Rüben, "*Étude sur le patois du Haut Limousin*," prefixed to *Poems* by J. Foucaud, in the *Limousin patois* (Limoges, 1886). As to dictionaries we may mention, among others, Andrews, *Vocabulaire français-mentonnais* (Nice, 1877); Azais, *Dictionnaire des idiomes romans du midi de la France* (Montpellier, 1877, 3 vols. 8vo), taking for its basis the dialect of Béziers; Chabrand and De Rochas d'Aiglun, *Patois des Alpes, Cottiennes et en particulier du Queyras* (Grenoble and Paris, 1877); Couzinié, *Dictionnaire de la langue romano-castraise* (Castres, 1880); Garcin, *Nouveau dictionnaire provençal français* (Draguignan, 1841, 2 vols.); Honnorat, *Dictionnaire provençal-français* (Digne, 1846-7, 2 vols. 4to); De Sauvages, *Dictionnaire languedocien-français* (new ed., Alais, 1820, 2 vols.); Vayssier, *Dictionnaire patois-français du département de l'Aveyron* (Rodez, 1879). From 1880 the *Dictionnaire provençal-français* of Fr. Mistral, in 2 vols. 4to, has been in progress; more than the half has appeared. This dictionary takes as its basis the variety of Maillane (in the north of Bouches-du-Rhône), the author's native district, and gives in as complete a manner as possible all the forms used in the south of France. It is by far the best of all the dictionaries of the southern dialects which have yet been published, and when finished it will almost enable the student to dispense with all the others.

II. PROVENÇAL LITERATURE.—Provençal literature is much more easily defined than the language in which it is expressed. Starting in the 11th and 12th centuries in several centres, it thence gradually spread

out, first over the greater portion, though not the whole, of southern France, and then into the north of Italy and Spain. It nowhere merged in the neighboring literatures. At the time of its highest development (12th century) the art of composing in the vulgar tongue did not exist, or was only beginning to exist, to the south of the Alps and the Pyrenees. In the north, in the country of French speech, vernacular poetry was in full bloom: but between the districts in which it had developed—Champagne, Île de France, Picardy, and Normandy—and the region in which Provençal literature had sprung up, there seems to have been an intermediate zone formed by Burgundy, Bourbonnais, Berry, Touraine, and Anjou which, far on in the Middle Ages, appears to have remained barren of vernacular literature. In its rise Provençal literature stands completely by itself, and in its development it long continued to be absolutely original. It presents at several points genuine analogies with the sister-literature of northern France; but these analogies are due principally to certain primary elements common to both and only in a slight degree to mutual reaction.

It must be inquired, however, what amount of originality could belong to any, even the most original, Romanic literature in the Middle Ages. In all Romanic countries compositions in the vernacular began to appear while the custom of writing in Latin was still preserved by uninterrupted tradition. Even during the most barbarous periods, when intellectual life was at its lowest, it was in Latin that sermons, lives of saints more or less apocryphal, accounts of miracles designed to attract pilgrims to certain shrines, monastic annals, legal documents, and contracts of all kinds were composed. When learning began to revive, as was the case in northern and central France under the influence of Charlemagne and later in the 11th century, it was Latin literature which naturally received increased attention, and the Latin language was more than ever employed in writing. Slowly and gradually the Romanic languages, especially those of France, came to occupy part of the ground formerly occupied by Latin, but even after the Middle Ages had passed away the parent tongue retained no small portions of its original empire. Consequently Romanic literatures in general (and this is especially true of Provençal as it does not extend beyond the mediæval period) afford only an incomplete representation of the intellectual development of each country. Those literatures even which are most truly national, as having been subjected to no external influence, are only to a limited extent capable of teaching us what the nation was. They were, in short, created in the interests of the illiterate part of the people, and to a considerable degree by those who were themselves illiterate. But that does not make them less interesting.

Origin.—It was in the 11th century, and at several places in the extensive territory whose limits have been described in the foregoing account of the Provençal language, that Provençal literature first made its appearance. It took poetic form; and its oldest monuments show a relative perfection and a variety from which it may be concluded that poetry had already received a considerable development. The oldest poetic text, if the date and origin be correctly determined, is said to be a Provençal refrain attached to a Latin poem recently published (*Zeitschrift für deutsche Philologie*, 1881, p. 335) from a Vatican MS., written, it is asserted, in the 10th century. But it is useless to linger over these few words, the text of which seems corrupt, or at least has not yet been satisfactorily interpreted. The honor of being the oldest literary monument of the Provençal language must be assigned to a fragment of two hundred and fifty-seven decasyllabic verses preserved in an Orleans MS. and frequently edited and annotated since it was first printed by Raynouard in 1817 in his *Choix des poésies originales des*

Troubadours. The writing of the MS. is of the first half of the 11th century. The peculiarities of the language point to the north of the Provençal region, probably Limousin or Marche. It is the beginning of a poem in which the unknown author, taking Boetius's treatise *De Consolatione Philosophiæ* as the groundwork of his composition, adopts and develops its ideas and gives them a Christian cast of which there is no trace in the original. Thus from some verses in which Boetius contrasts his happy youth with his afflicted old age he draws a lengthy homily on the necessity of laying up from early years a treasure of good works. The poem is consequently a didactic piece composed by a "clerk" knowing Latin. He doubtless preferred the poetic form to prose because his illiterate contemporaries were accustomed to poetry in the vulgar tongue, and because this form was better adapted to recitation; and thus his work, while a product of erudition in as far as it was an adaptation of a Latin treatise, shows that at the time when it was composed a vernacular poetry was in existence. A little later, at the close of the same century, we have the poems of William IX., count of Poitiers, duke of Guienne. They consist of eleven very diverse strophic pieces, and were consequently meant to be sung. Several are love songs; one relates a *bonne fortune* in very gross terms; and the most important of all—the only one which can be approximately dated, being composed at the time when William was setting out for Spain to fight the Saracens—expresses in touching and often noble words the writer's regret for the frivolity of his past life and the apprehensions which oppressed him as he bade farewell, perhaps for ever, to his country and his young son. We also know from Ordericus Vitalis that William IX. had composed various poems on the incidents of his ill-fated expedition to the Holy Land in 1101. And it must further be mentioned that in one of his pieces (*Ben voil que sapçon li plusor*) he makes a very clear allusion to a kind of poetry which we know only by specimens of later date, the *partimen*, or, as it is called in France, the *jeu parti*. William IX. was born in 1071 and died in 1127. There is no doubt that the most prolific period of his literary activity was his youth. On the other hand there is no reason to believe that he created the type of poetry of which he is to us the oldest representative. It is easy to understand how his high social rank saved some of his productions from oblivion whilst the poems of his predecessors and contemporaries disappeared with the generations who heard and sang them; and in the contrast in form and subject between the Boetius poem and the stanzas of William IX. we find evidence that by the 11th century Provençal poetry was being rapidly developed in various directions. Whence came this poetry? How and by whose work was it formed? That it has no connection whatever with Latin poetry is generally admitted. There is absolutely nothing in common either in form or ideas between the last productions of classical Latinity, as they appear in Sidonius Apollinaris or Fortunatus, and the first poetic compositions in Romanic. The view which seems to meet with general acceptance, though it has not been distinctly formulated by any one, is that Romanic poetry sprang out of a popular poetry quietly holding its place from the Roman times, no specimen of which has survived,—just as the Romanic languages are only continuations with local modifications of vulgar Latin. There are both truth and error in this opinion. The question is really a very complex one. First as to the form: Romanic versification, as it appears in the Boetius poem and the verses of William IX., and a little farther north in the poem of the *Pasion* and the *Life of St. Leger* (10th or 11th century), has with all its variety some general and permanent characteristics; it is rhymed, and it is composed of a definite number of syllables certain of which have the syllabic accent. This form has evident affinity with the rhythmic Latin versification, of which specimens

exist from the close of the Roman empire in ecclesiastical poetry. The exact type of Romanic verse is not found, however, in this ecclesiastical Latin poetry; the latter was not popular, and it may be assumed that that there was a popular variety of rhythmic poetry from which Romanic verse is derived.

Again, as regards the substance, the poetic material, we find nothing in the earliest Provençal which is strictly popular. The extremely personal compositions of William IX. have nothing in common with folklore. They are subjective poetry addressed to a very limited and probably rather aristocratic audience. The same may be said of the Boetius poem, though it belongs to the quite different species of edifying literature; at any rate it is not popular poetry. Vernacular compositions seem to have been at first produced for the amusement, or in the case of religious poetry for the edification, of that part of lay society which had leisure and lands, and reckoned intellectual pastime among the good things of life. Gradually this class, intelligent, but with no Latin education, enlarged the circle of its ideas. In the 12th century and still more in the 13th, historical works and popular treatises on contemporary science were composed for its use in the only language it understood; and vernacular literature continued gradually to develop partly on original lines and partly by borrowing from the literature of the "clerks." But in the 11th century vernacular poetry was still rather limited, and has hardly any higher object than the amusement and edification of the upper classes. An aristocratic poetry like the oldest Provençal cannot be the production of shepherds and husbandmen; and there is no probability that it was invented or even very notably improved by William IX.

From what class of persons then did it proceed? Latin chroniclers of the Middle Ages mention as *joculares*, *joculatores*, men of a class not very highly esteemed whose profession consisted in amusing their audience either by what we still call jugglers' tricks, by exhibiting performing animals, or by recitation and song. They are called *joglars* in Provençal, *jouglers* or *jogeleurs* in French. A certain Barnaldus, styled *joglaris*, appears as witness in 1058 to a charter of the chartulary of Saint Victor at Marseilles. In 1106 the act of foundation of a *salva terra* in Rouergue specifies that neither knight nor man-at-arms nor *joculator* is to reside in the village about to be created. These individuals—successors of the *mimi* and the *thymelici* of antiquity, who were professional amusers of the public—were the first authors of poetry in the vernacular both in the south and in the north of France. To the upper classes who welcomed them to their castles they supplied that sort of entertainment now sought at the theatre or in books of light literature. There were certain of them who, leaving buffoonery to the ruder and less intelligent members of the profession, devoted themselves to the composition of pieces intended for singing and consequently in verse. In the north, where manners were not so refined and where the taste for warlike adventure prevailed, the *jongleurs* produced *chansons de geste* full of tales of battle and combat. In the courts of the southern nobles, where wealth was more abundant and a life of ease and pleasure was consequently indulged in, they produced love songs. There is probably a large amount of truth in the remark made by Dante in chapter xxv. of his *Vita Nuova*, that the first to compose in the vulgar tongue did so because he wished to be understood by a lady who would have found it difficult to follow Latin verses.¹ And in fact there are love songs among the pieces by William of Poitiers; and the same type preponderates among the compositions of the troubadours who came immediately after him. But it is worthy of note that in all this vast body of love poetry there is no epithalamium nor any address to a mar-

¹ "E lo primo che comenciò a dire siccome poeta volgare si mosse però che volle fare intendere le sue parole a donna alla quale era malagevole ad intendere i versi latini."

riageable lady. The social conditions of the south of France in the feudal period explain in great measure the powerful development of this kind of poetry, and also its peculiar characteristics—the profound respect, the extreme deference of the poet towards the lady whom he addresses. Rich heiresses were married young, often when hardly out of their girlhood, and most frequently without their fancy being consulted. But they seem after marriage to have enjoyed great liberty. Eager for pleasure and greedy of praise, the fair ladies of the castle became the natural patronesses of the *mesnie* or household of men-at-arms and jongleurs whom their husbands maintained in their castles. Songs of love addressed to them soon became an accepted and almost conventional form of literature; and, as in social position the authors were generally far below those to whom they directed their amorous complaints, this kind of poetry was always distinguished by great reserve and an essentially respectful style. From the beginning the sentiments, real or assumed, of the poets are expressed in such a refined and guarded style that some historians, overestimating the virtue of the ladies of that time, have been misled to the belief that the love of the troubadour for the mistress of his thoughts was generally platonic and conventional.

The conditions under which Romanic poetry arose in the south of France being thus determined as accurately as the scarcity of documents allows, we now proceed to give a survey of the various forms of Provençal literature, chronological order being followed in each instance. By this arrangement the wealth of each form will be better displayed; and, as it is rare in the south of France for the same person to distinguish himself in more than one of them, there will be generally no occasion to introduce the same author in different sections.

Poetry of the Troubadours.—Though he was certainly not the creator of the lyric poetry of southern France, William, count of Poitiers, by personally cultivating it gave it a position of honor, and indirectly contributed in a very powerful degree to insure its development and preservation. Shortly after him centres of poetic activity make their appearance in various places—first in Limousin and Gascony. In the former province lived a viscount of Ventadour, Eble, who during the second part of William of Poitiers's life seems to have been brought into relation with him, and according to a contemporary historian, Geffrei, prior of Vigéois, *erat valde gratus in cantilenis*. We possess none of his compositions; but under his influence Bernard of Ventadour was trained to poetry, who, though only the son of one of the serving-men of the castle, managed to gain the love of the lady of Ventadour, and, when on the discovery of their amour he had to depart elsewhere, received a gracious welcome from Eleanor of Guienne, consort (from 1152) of Henry II. of England. Of Bernard's compositions we possess about fifty songs of elegant simplicity, some of which may be taken as the most perfect specimens of love poetry Provençal literature has ever produced. Bernard must therefore have been in repute before the middle of the 12th century; and his poetic career extended well on towards its close. At the same period, or probably a little earlier, flourished Cercamon, a poet certainly inferior to Bernard, to judge by the few pieces he has left us, but nevertheless of genuine importance among the troubadours both because of his early date and because definite information regarding him has been preserved. He was a Gascon, and composed, says his old biographer, "pastorals" according to the ancient custom (*pastorelas a la uzanza antiga*). This is the record of the appearance in the south of France of a poetic form which ultimately acquired large development. The period at which Cercamon lived is determined by a piece where he alludes very clearly to the approaching marriage of the king of France, Louis VII., with Eleanor of Guienne (1137).

Among the earliest troubadours may also be reckoned Marcabrun, a pupil of Cercamon's, from whose pen we have about forty pieces, those with dates ranging from 1135 to 1148 or thereabout. This poet has great originality of thought and style. His songs, several of which are historical, are free from the commonplaces of their class, and contain curious strictures on the corruptions of the time.

We cannot here do more than enumerate the leading troubadours and briefly indicate in what conditions their poetry was developed and through what circumstances it fell into decay and finally disappeared: Peter of Auvergne (Peire d'Alvernha), who in certain respects must be classed with Marcabrun; Arnaut Daniel, remarkable for his complicated versification, the inventor of the *sestina*, a poetic form for which Dante and Petrarch express an admiration difficult for us to understand; Arnolt of Mareuil (Arnaut de Maroill), who while less famous than Arnaut Daniel, certainly surpasses him in elegant simplicity of form and delicacy of sentiment; Bertran de Born, now the most generally known of all the troubadours on account of the part he played both by his sword and his *serventesces* in the struggle between Henry II. of England and his rebel sons; Peire Vidal of Toulouse, a poet of varied inspiration, who grew rich with gifts bestowed on him by the greatest nobles of his time; Guiraut de Bornel, *lo maestre dels trobadors*, and at any rate master in the art of the so-called "close" style (*trobor chus*), though he has also left us poems of charming simplicity; Gaucelm Faidit, from whom we have a touching lament (*planh*) on the death of Richard Cœur de Lion; Folquet of Marseilles, the most powerful thinker among the poets of the south, who from being a troubadour became first a monk, then an abbot, and finally bishop of Toulouse.

It is not without interest to discover from what class of society the troubadours came. Many of them, there is no doubt, had a very humble origin. Bernard of Ventadour's father was a servant, Peire Vidal's a maker of furred garments, Perdigon's a fisher. Others belonged to the bourgeoisie: Peire d'Alvernha, for example, Peire Raimon of Toulouse, Elias Fonsalada. More rarely we see traders' sons becoming troubadours; this was the case with Folquet of Marseilles and Aimeric de Pegulhan. A great many were clerics, or at least studied for the church,—for instance, Arnaut of Mareuil, Hugh of Saint Circq (Uc de Saint Circ), Aimeric de Belenoi, Hugh Brunet, Peire Cardinal; some had even taken orders—the monk of Montaudon, the monk Gaubert of Puicibot. Ecclesiastical authority did not always tolerate this breach of discipline. Gui d'Uissel, canon and troubadour, was obliged by the injunction of the pontifical legate to give up his song-making. One point is particularly striking—the number of nobles (usually poor knights whose incomes were insufficient to support their rank) who became troubadours, or even, by a greater descent, jongleurs—Raimon de Miraval, Pons de Capdoill, Guillem Azemar, Cadenet, Peirol, Raimbaut de Vacqueiras, and many more. There is no doubt they betook themselves to poetry not merely for their own pleasure, but for the sake of the gifts to be obtained from the nobles whose courts they frequented. A very different position was occupied by such important persons as William of Poitiers, Raimbaut of Orange, the viscount of Saint Antonin, William of Berga, and Blacatz, who made poetry for their own amusement, but contributed not a little, by thus becoming troubadours, to raise the profession.

The profession itself was entirely dependent on the existence and prosperity of the feudal courts. The troubadours could hardly expect to obtain a livelihood from any other quarter than the generosity of the great. It will consequently be well to mention the more important at least of those princes who are known to have been patrons and some of them practicers of the poetic art. They are arranged approximately in

geographical order, and after each are inserted the names of those troubadours with whom they were connected.

France.—ELEANOR OF GUIENNE, Bernart of Ventadour (Ventadorn); HENRY CURTMANTLE, son of Henry II. of England, Bertran de Born; RICHARD CŒUR DE LION, Arnaut Daniel, Peire Vidal, Folquet of Marseilles, Gaucelm Faidit; ERMENGARDE OF NARBONNE (1143-1192), Bernart of Ventadour, Peire Rogier, Peire d'Alvernha; RAIMON V., count of Toulouse (1143-1194), Bernart of Ventadour, Peire Rogier, Peire Raimon, Hugh Brunet, Peire Vidal, Folquet of Marseilles, Bernart of Durfort; RAIMON VI., count of Toulouse (1194-1222), Raimon de Miraval, Aimeric de Pegulhan, Aimeric de Belenoi, Ademar lo Negre; ALPHONSE II., count of Provence (1185-1209), Elias de Barjols; RAIMON BERENGIER IV., count of Provence (1209-1245), Sordel; BARREL, viscount of Marseilles (died c. 1192), Peire Vidal, Folquet of Marseilles; WILLIAM VIII., lord of Montpellier (1172-1204), Peire Raimon, Arnaut de Mareuil, Folquet of Marseilles, Guiraut de Calanson, Aimeric de Sarlat; ROBERT, dauphin of Auvergne (1169-1234), Peirol, Perdigon, Pierre de Maensac, Gaucelm Faidit; GUILLAUME DU BAUS, prince of Orange (1182-1218), Raimbaut de Vacqueiras, Perdigon; SAVARIC DE MAULÉON (1200-1230), Gaucelm de Puicibot, Hugh of Saint Cirq; BLACATZ, a Provençal noble (1200?-1236), Cadenet, Jean d'Aubusson, Sordel, Guillem Figueira; HENRY I., count of Rodez (1208-1222?), Hugh of Saint Cirq; perhaps HUGH IV., count of Rodez (1222?-1274), and HENRY II., count of Rodez (1274-1302), Guiraut Riquier, Folquet de Lunel, Serveri de Girone, Bertran Carbonel; NUNYO SANCHEZ, count of Roussillon (died in 1241), Aimeric de Belenoi; BERNARD IV., count of Astarac (1249-1291), Guiraut Riquier, Amanieu de Sescas.

Spain.—ALPHONSE II., king of Aragon (1162-1196), Peire Rogier, Peire Raimon, Peire Vidal, Cadenet, Guiraut de Cabreira, Elias de Barjols, the monk of Montaudon, Hugh Brunet; PETER II., king of Aragon (1196-1213), Raimon de Miraval, Aimeric de Pegulhan, Perdigon, Ademar lo Negre, Hugh of Saint Cirq; JAMES I., king of Aragon (1213-1276), Peire Cardinal, Bernart Sicart de Marcejols, Guiraut Riquier, At de Mons; PETER III., king of Aragon (1276-1285), Paulet of Marseilles, Guiraut Riquier, Serveri de Girone; ALPHONSO IX., king of Leon (1138-1214), Peire Rogier, Guiraut de Borneil, Aimeric de Pegulhan, Hugh of Saint Cirq; ALPHONSO X., king of Castile (1252-1284), Bertran de Lamanon, Bonifaci Calvo, Guiraut Riquier, Folquet de Lunel, Arnaut Plages, Bertran Carbonel.

Italy.—BONIFACE, Marquis of Montferrat (1192-1207), Peire Vidal, Raimbaut de Vacqueiras, Elias Cairel, Gaucelm Faidit (?); FREDERICK II. emperor (1215-1250), Jean d'Aubusson, Aimeric de Pegulhan, Guillem Figueira; AZZO VI., marquis of Este (1196-1212), Aimeric de Pegulhan, Rambertin de Buvalet; AZZO VIII., marquis of Este (1215-1264) Aimeric de Pegulhan.

The first thing that strikes one in this list is that, while the troubadours find protectors in Spain and Italy, they do not seem to have been welcomed in French speaking countries. This, however, must not be taken too absolutely. Provençal poetry was appreciated in the north of France. There is reason to believe that when Constance, daughter of one of the counts of Arles, was married in 998 to Robert, king of France, she brought along with her Provençal jongleurs. Poems by troubadours are quoted in the French romances of the beginning of the 13th century; some of them are transcribed in the old collections of French songs, and the preacher Robert de Sorbon informs us in a curious passage that one day a jongleur sang a poem by Folquet of Marseilles at the court of the king of France. But in any case it is easy to understand that, the countries of the *langue d'oui* having a full developed literature of their own suited to the taste of the people, the troubadours generally preferred to go to regions where they had less to fear in the way of competition.

The decline and fall of troubadour poetry was mainly due to political causes. When about the beginning of the 13th century the Albigensian war had ruined a large number of the nobles and reduced to lasting poverty a part of the south of France, the profession of troubadour ceased to be lucrative. It was then that many of those poets went to spend their last days in the north of Spain and Italy, where Provençal poetry had for more than one generation

been highly esteemed. Following their example, other poets who were not natives of the south of France began to compose in Provençal, and this fashion continued till, about the middle of the 13th century, they gradually abandoned the foreign tongue in northern Italy, and somewhat later in Catalonia, and took to singing the same airs in the local dialects. About the same time in the Provençal region the flame of poetry had died out save in a few places—Narbonne, Rodez, Foix, and Astarac—where it kept burning feebly for a little longer. In the 14th century composition in the language of the country was still practiced; but the productions of this period are mainly works for instruction and edification, translations from Latin or sometimes even from French, with an occasional romance. As for the poetry of the troubadours, it was dead forever.

Form.—Originally the poems of the troubadours were intended to be sung. The poet usually composed the music as well as the words; and in several cases he owed his fame more to his musical than to his literary ability. Two manuscripts preserve specimens of the music of the troubadours; but, as the subject has not as yet been investigated, we are still ignorant of one of the elements of their success. The following are the principal poetic forms which they employed. The oldest and most usual generic term is *vers*, by which is understood any composition intended to be sung, no matter what the subject. At the close of the 12th century it became customary to call all verse treating of love *canso*—the name *vers* being then more generally reserved for poems on other themes. The *sirventesc* differs from the *vers* and the *canso* only by its subject being for the most part devoted to moral and political topics. Peire Cardinal is celebrated for the *sirventeses* he composed against the clergy of his time. The political poems of Bertran de Born are *sirventeses*. There is reason to believe that originally this word meant simply a poem composed by a *sirvent* (Lat. *serviens*) or man-at-arms. The *sirventesc* is very frequently composed in the form, sometimes even with the rhymes, of a popular song, so that it might be sung to the same air. The *tenson* is a debate between two interlocutors, each of whom has a stanza in turn. The *partimen* (Fr. *jeu parti*) is also a poetic debate, but it differs from the *tenson* in so far that the range of debate is limited. In the first stanza one of the partners proposes two alternatives; the other partner chooses one of them and defends it, and the opposite side remains to be defended by the original propounder. Often in a final couplet a judge or arbiter is appointed to decide between the parties. This poetic game is mentioned by William, count of Poitiers, at the end of the 11th century. The *pastorela*, afterwards *pastorela*, is in general an account of the love adventures of a knight with a shepherdess. All these classes have one form capable of endless variations, five or more stanzas and one or two envois. The *dansa* and *balada*, intended to mark the time in dancing, are pieces with a refrain. The *alba*, which has also a refrain, is, as the name indicates, a waking or morning song at the dawning of the day. All those classes are in stanzas. The *descort* is not thus divided, and consequently it must be set to music right through. Its name is derived from the fact that, its component parts not being equal, there is a kind of "discord" between them. It is generally reserved for themes of love. Other kinds of lyric poems, sometimes with nothing new about them except the name, were developed in the south of France; but those here mentioned are the more important.

Narrative Poetry.—Although the strictly lyric poetry of the troubadours forms the most original part of Provençal literature, it must not be supposed that the remainder is of trifling importance. Narrative poetry, especially, received in the south of France a great development, and, thanks to recent discoveries, a considerable body of it has already become known. Several classes must be distinguished: the *chanson de geste* legendary or historic, the romance of adventure, and the novel. Northern France remains emphatically the native country of the *chanson de geste*; but, although in the south different social conditions, a more delicate taste, and a higher state of civilization prevented a similar profusion of tales of war and heroic deeds, Provençal literature has some highly important specimens of this class. The first place belongs to *Girart de Roussillon*, a poem of ten thousand verses, which relates the struggles of Charles Martel with his powerful vassal the Burgundian Gerard of Roussillon. It is a literary production of rare excellence and of exceptional interest for the history of civilization in the 11th and 12th centuries.

Gerard of Roussillon belongs only within certain limits to the literature of southern France. The recension which we possess appears to have been made on the borders of Limousin and Poitou; but it is clearly no more than a recast of an older poem no longer extant, probably either of French or at least Burgundian origin. To Limousin also seems to belong the poem of *Aigars* and *Maurin* (12th century), of which we have unfortunately only a fragment so short that the subject cannot be clearly made out. Of less heroic character is the poem of *Daurel and Beton* (end of the 12th or beginning of the 13th century), connected with the cycle of Charlemagne, but by the romantic character of the events more like a regular romance of adventure. We cannot, however, form a complete judgment in regard to it, as the only MS. in which it has been preserved is defective at the close, and that to an amount there is no means of ascertaining. Midway between legend and history may be classified the Provençal *Chanson of Antioch*, a fragment of which, 700 verses in extent, has been recently recovered in Madrid and published in *Archives de l'Orient Latin*, vol. ii. To history proper belongs the chanson of the crusade against the Albigensians, which, in its present state, is composed of two poems one tacked to the other: the first, containing the events from the beginning of the crusade till 1213, is the work of a certain William of Tudela, a moderate supporter of the crusaders; the second, from 1213 to 1218, is by a vehement opponent of the enterprise. The language and style of the two parts are no less different than the opinions. Finally, about 1280 a native of Toulouse named Guillaume Anelier composed, in the Chanson de geste form, a poem on the war carried on in Navarre by the French in 1276 and 1277. It is an historical work of little literary merit. All these poems are, as chansons de geste ought to be, in stanzas of indefinite length, with a single rhyme. *Gerard of Roussillon*, *Aigars* and *Maurin*, and *Daurel and Beton* are in verses of ten, the others in verses of twelve syllables. The peculiarity of the versification in *Gerard* is that the pause in the line occurs after the sixth syllable, and not, as is usual, after the fourth. Like the chanson de geste, the romance of adventure is but slightly represented in the south; but it is to be borne in mind that many works of this class must have perished, as is rendered evident by the mere fact that, with few exceptions, the narrative poems which have come down to us are each known by a single manuscript only. We possess but three Provençal romances of adventure: *Jaufré* (composed in the middle of the 13th century, and dedicated to a king of Aragon, possibly James I.), *Blandin of Cornwall*, and *Guilem de la Barra*. The first two are connected with the Arthurian cycle: *Jaufré* is an elegant and ingenious work; *Blandin of Cornwall* the dullest and most insipid one can well imagine. The romance of *Guilem de la Barra* tells an unlikely story also found in Boccaccio's *Decameron* (2d Day, viii). It is rather a poor poem; but as a contribution to literary history it has the advantage of being dated. It was completed in 1318, and is dedicated to a noble of Languedoc called Sicart de Montaut. Connected with the romance of adventure is the novel (in Provençal *novas*, always in the plural,) which is originally an account of an event "newly" happened. The novel must have been at first in the south what, as we see by the *Decameron*, it was in Italy, a society pastime,—the wits in turn relating anecdotes, true or imaginary, which they think likely to amuse their auditors. But before long this kind of production was treated in verse, the form adopted being that of the romances of adventure—octosyllabic verses rhyming in pairs. Some of those novels which have come down to us may be ranked with the most graceful works in Provençal literature; two are from the pen of the Catalan author Raimon Vidal de Besalú. One, the *Castia-gilos* (the Chastisement of the Jealous Man), is a treatment, not easily matched for elegance, of a frequently handled theme—the story of the husband who, in order to entrap his wife, takes the disguise of a lover whom she is expecting and receives with satisfaction blows intended, as he thinks, for him whose part he is playing; the other, *The Judgment of Love*, is the recital of a question of the law of love, departing considerably from the subjects usually treated in the novels. Mention may also be made of the novel of *The Parrot* by Arnaut de Carcassonne, in which the principal character is a parrot of great eloquence and ability, who succeeds marvellously in securing the success of the amorous enterprises of his master. Novels came to be extended to the proportions of a long romance. *Flamenca*, which belongs to the novel type, has still over eight thousand verses, though the only MS. of it has lost some leaves both at the beginning and at the end. This poem, composed in all probability in 1234, is the story of a lady who by very ingenious devices, not unlike those employed in the *Miles Gloriosus* of Plautus, succeeds in eluding the vig-

ilance of her jealous husband. No analysis can be given here of a work the action of which is so highly complicated; suffice it to remark that there is no book in mediæval literature which betokens so much quickness of intellect and is so instructive in regard to the manners and usages of polite society in the 13th century. We know that novels were in great favor in the south of France, although the specimens preserved are not very numerous. Statements made by Francesco de Barberino (early part of 14th century), and recently brought to light, give us a glimpse of several works of this class which have been lost. From the south of France the novel spread into Catalonia, where we find in the 14th century a number of novels in verse very similar to the Provençal ones, and into Italy, where in general the prose form has been adopted.

Didactic and Religious Poetry.—Compositions intended for instruction, correction, and edification were very numerous in the south of France as well as elsewhere, and, in spite of the enormous losses sustained by the Provençal literature, much of this kind still remains. But it is seldom that such works have much originality or literary value. Originality was naturally absent, as the aim of the writers was mainly to bring the teaching contained in Latin works within the reach of lay hearers or readers. Literary value was not of course excluded by the lack of originality, but by an unfortunate chance the greater part of those who sought to instruct or edify, and attempted to substitute moral works for secular production in favor with the people, were persons of limited ability. It is needless to enumerate all the lives of saints, all the treatises of popular theology and morals, all the books of devotion, all the pious canticles, composed in Provençal during the Middle Ages. Enough to recall the Boetius poem (unfortunately a mere fragment) already mentioned as one of the oldest documents of the language and really a remarkable work. From the multitude of saints' lives we may single out that of St. Honorat of Lerins by Raimon Feraud (about 1300), which is distinguished by variety and elegance of versification, but is almost entirely a translation from Latin. Among poems strictly didactic one stands out by reason of its great extent (nearly thirty-five thousand verses) and the somewhat original conception of its scheme—the *Breviari d'amor*, a vast encyclopædia, on a theological basis, composed by the Minorite friar Matfre Ermengaut of Béziers between 1288 and 1300 or thereabout.

Drama.—Twenty years ago it might have been questioned whether dramatic representation was known in the south of France, but within that time several short dramatic pieces have been published or described; and a considerable number of actual theatrical representations have been found mentioned in the local records. Everything of this kind that we know of belongs to the religious drama, the oldest form in every mediæval literature. The period at which a purely secular theatre takes its rise in most quarters is the 15th century; and by that time there was hardly any Provençal literature left. We possess in Provençal mysteries of Saint Agnes, of the Passion, of the Marriage of the Virgin, all belonging to the close of the 13th century or of the first half of the 14th. In the 15th century there is a fragment of a mystery of St. James. Provence properly so-called, especially the eastern portion of it, seems to have been particularly fond of representations of this sort, to judge by the entries in the local records. At the close of the 15th and the beginning of the 16th century many mysteries were played in the part of Dauphiné which corresponds to the present department of Hautes-Alpes. Five mysteries of this district, composed and played somewhere about 1500 (the mysteries of St. Eustace, of St. Andrew, of St. Pons, of Sts. Peter and Paul, and of St. Anthony of Vienne), have come down to us, and are now (1885) being edited. The influence of the contemporary French sacred drama may to some extent be traced in them.

Prose.—Prose composition in the south of France belongs to a comparatively late stage of literary development; and the same remark applies to the other Romanic countries, particularly to northern France, where prose hardly comes into fashion till the 13th century, the prose of the preceding century being little else than translations of the books of the Bible (especially the Psalter).

As early as the 12th century we find in the south sermons, whose importance is more linguistic than literary. To the 13th century belong certain lives of the troubadours intended to be prefixed to, and to explain, their poems. They were written before 1250, when the first anthologies of troubadour poetry were compiled; and some of them are the work of the troubadour Hugh of St. Circq. To the same period must be assigned *Las Razos de trobar* of the troubadour Raimon Vidal de Besalú (an elegant little treatise touching on various points of grammar and the poetic art), and also the *Donatz Proensals* of Hugh Faidit, a writer

otherwise unknown, who drew up his purely grammatical work at the request of two natives of northern Italy. Of about the same date are two translations of the New Testament, one of which, preserved in MS. at Lyons, seems to have been made for Albigensians. A remarkable work, both in style and thought, is the *Life of St. Douceline*, who lived at the close of the 13th century near Marseilles, and founded an order of Beguines. In the 14th century compositions in prose grew more numerous. Some rare local chronicles may be mentioned, the most interesting being that of Mascaro, which contains the annals of the town of Béziers from 1338 to 1390. Theological treatises and pious legends translated from Latin and French also increase in number. The leading prose work of this period is the treatise on grammar, poetry, and rhetoric known by the name of *Leys d' Amors*. It was composed in Toulouse, shortly before 1350, by a group of scholars, and was intended to fix the rules of the language with a view to the promotion of a poetical renaissance. For this purpose an academy was founded which awarded prizes in the shape of flowers to the best compositions in verse. We still possess the collection of the pieces crowned by this academy during the 14th century, and a large part of the 15th (*Flors del gay saber*). Unfortunately they are rather academic than poetic. The *Leys d' Amors*, which was to be the starting point and rule of the new poetry is the best production of this abortive renaissance. The decay of Provençal literature arrived too soon to allow of a full development of prose. The 14th and 15th centuries were in no respect a prosperous period for literature in the south of France. In the 15th century people began to write French both in verse and prose; and from that time Provençal literature became a thing of the past.

Bibliography.—Fauriel, *Histoire de la poésie provençale* (Paris, 1846, 3 vols. 8vo.), is quite antiquated. Not only are three-fourths of the works in Provençal poetry ignored, but the very idea of the book is vitiated by the author's system (now abandoned), based on the supposition that in the south of France there was an immense epic literature. The articles on the troubadours in the *Histoire littéraire de la France*, by Ginguéné, E. David, etc., must be consulted with extreme caution. F. Diez's *Die poesie der Troubadours* (Zwickau, 1827, 8vo.; new ed. by Bartsch, 1883) and his *Leben und Werke der Troubadours* (Zwickau, 1829, 8vo.; new ed. by Bartsch, 1882) are of great excellence for the time at which they appeared. For the history of Provençal literature in Spain, see Milay Fontanals, *De los trovadores en España* (Barcelona, 1861, 8vo.); for Italy, Cavedoni, *Ricerche storiche intorno ai trovatori provenzali* (Modena, 1844, 8vo.); A. Thomas, *Francesco Barberino e la letteratura provençale in Italia* (Paris, 1883, 8vo.); O. Schultz, "Die Lebensverhältnisse der italienischen Troubadours," in *Zeits. für romanische Philologie* (1883). For the bibliography consult especially Bartsch, *Grundriss zur Geschichte der provenzalischen Literatur* (Elberfeld, 1872, 8vo.). For texts the reader may be referred to Raynoud, *Choix de poésies originales des Troubadours* (1816–21, 6 vols. 8vo.), and *Lexique roman, ou dict. de la langue des troubadours*, of which vol. i. (1838) is entirely taken up with texts; and Rochegude, *Parnasse occitanien* (Toulouse, 1819, 8vo.). All the pieces published by Raynoud and Rochegude have been reprinted without amendment by Mahn. *Die Werke der Troubadours in provenz. Sprache* (Berlin, 8vo., vol. i. 1846, ii. 1855–64, iii. 1880, iv., containing an edition of the troubadour Guiraut Riquier, 1884). The same editor's *Gedichte der Troubadours* (Berlin, 1856–73) is a collection conspicuous for its want of order and of accuracy (see *Romania*, lii. 303). Among editions of individual troubadours may be mentioned—*Peire Vidal's Lieder*, by Karl Bartsch (Berlin, 1857, 12 mo.); *Les derniers troubadours de la Provence*, by Paul Meyer (Paris, 1871, 8vo.); *Der Troubadour Jaufré Rudel, sein Leben und seine Werke*, by A. Stimming (Kiel, 1873, 8vo.); *Bertran de Born, sein Leben und seine Werke*, by A. Stimming (Halle, 1879, 8vo.); *Guilhem Figueira, ein provenzalischer Troubadour*, by E. Levy (Berlin, 1880, 8vo.); *Das Leben und die Lieder des Troubadours Peire Rogier*, by Carl Appel (Berlin, 1882, 8vo.); *La vita e le opere del trovatore Arnaldo Daniello*, by U. A. Canello (Halle, 1883, 8vo.). Among editions of Provençal works of a miscellaneous kind are—Bartsch, *Denkmäler der provenzalischen Literatur* (Stuttgart, 1856, 8vo.); H. Suchier, *Denkmäler der provenz. Literatur und Sprache* (Halle, 1883–85, 2 vols. 8vo.); Fr. Arnalage, *Sermons du XII siècle en vieux provençal* (Heilbronn, 1884, 12 mo.); Paul Meyer, *La Chanson de la Croisade contre les Albigeois*, (Paris, 1875–79, 2 vols. 8vo.); Id., *Dauriel et Beton, Chanson de geste provençale* (Paris, 1880, 8vo.); Id., *Le Roman de Flamenca* (Paris, 1885, 8vo.); E. Stengel, *Die beiden ältesten provenzal. Grammatiken, lo Donatz proensals und las Razos de trobar* (Marburg, 1878, 8vo.); Bartsch, *Sancta Agnes, provenz. geistliches Schauspiel* (Berlin, 1867, 8vo.); *Le Breviari d'amor de Malfre Ermengaud*, published by the Archaeological Society of Béziers (Béziers, 1862–80, 2 vols. 8vo.); A. L. Sardou, *La Vida de Sant Honorat, legenden envers provençaux par Raymond Feraud* (Nice [1875], 8vo.). Documents and dissertations on various points of Provençal literature will be found in almost all the volumes of *Romania* (Paris, in progress since 1872, 8vo.), and the *Revue des Langues romanes* (Montpellier, in progress since 1870, 8vo.). See also the other journals devoted in Germany and Italy to the Romanic languages, *passim*. (P. M.)

PROVENCE (*Provincia*), a province of France lying to the extreme southeast on the shores of the Mediterranean, bounded on the W. by Languedoc, on the N. by Venaissin and Dauphiné, and on the E. by Italy. It now forms the departments of Bouches-du-Rhône, Var, and Basses-Alpes, with portions of Vaucluse and Alpes Maritimes. It was divided into

Upper Provence, containing the four seneschalates of Forcalquier, Castellane, Sisteron Digne, and the Valley of Barcelonnette; and Lower Provence, containing the eight seneschalates of Aix, Arles, Brignoles, Grasse, Marseilles, Draguignan, Hyères, and Toulon. In ancient as in modern times the most important city was Marseilles (Marsillia), a chief seat of trade for the Greek merchants of the Mediterranean, who extended their power along the coast and founded Agde, Antibes, Grasse, and Nice. They afterwards called in the aid of the Romans (125 B.C.) against the Ligurian inhabitants of the surrounding country, and the new-comers soon made themselves masters of the territory which later formed the provinces of Languedoc, Dauphiné, and Provence. The new province, of which the capital was Aquæ Sextiæ (Aix), was called Provincia Gallica until the total conquest of Gaul, when the name of the district was changed to Gallia Narbonensis. In the 4th century of the Christian era, when the greater part of Languedoc, or Narbonensis Prima, had become subject to the Visigoths, and the Burgundians had spread to the Viennois, Provincia came to be applied only to the country lying between the Rhone, the Durance, and the Alps which was still held by the Romans. But they could not withstand for long the advancing tide of barbarian power. Although the Visigothic king, Theodoric I. was defeated by Aetius before Arles in 425 A.D., and their united armies in turn defeated Attila in 451, yet Theodoric II. imposed the emperor Avitus on the Romans, and Euric by the capture of Arles (480) made the Visigoths masters of Provence. Their defeat at the battle of Boulogne in 507 by Clovis and Gundibald, king of the Burgundians, placed Provence at the mercy of the latter, who ceded it in 511 to Theodoric, king of the Ostrogoths, as guardian of the Visigothic king. The powers so gained were, however, resigned by his successor Witiges in 536 to Theodebert, king of the Franks, who had previously overthrown the Burgundian kingdom. On the death of Clotaire I. (561) Provence was divided between his sons Sigebert, king of Austrasia, and Gontran, king of Burgundy, Marseilles falling to the former and Arles to the latter. When Gontran died in 593 the province was united under his nephew Childebert, only to be divided again by his sons and reunited under Clotaire II. (613), until the sons of Dagobert, Sigebert II., and Clovis II. (633) parted it between them. In 719 the Saracens crossed the Pyrenees and made themselves masters of almost all Septimania, or Languedoc, and in 739 they joined with Maurontis, a Byzantine governor of Marseilles, in his attempt to drive out the Franks. Fortunately for Europe, their forces were completely defeated by Charles Martel, who again united Provence to the Frankish kingdom. On the division of the Carolingian empire in 843 Provence fell to Lothair, who left it with the title of king to his son Charles (855), at whose death without issue in 863 it was seized by Charles the Bald. In 879 his brother-in-law Boson, son-in-law of the emperor Louis II., and governor of Vienne, was elected king by the synod of Mantale, when his united provinces became known as Cisjuran Burgundy. His son, Louis the Blind, obtained the crown of Italy (900), but was deposed by Hugo, who, in his turn obtaining the Italian kingdom, ceded Provence in 932 to Rudolph II., king of Transjuran Burgundy. The two Burgundies thus united received the name of the Kingdom of Arles, which lasted in a phantom form until 1032, but Provence was always governed by princes whose powers gradually increased, until the county was changed from a beneficiary to an hereditary fief. The line of beneficiary counts begins with Boson I. (926), who was reinvested by Rudolph II. in 934. He was succeeded by Boson II. (948), whose son William I. (968) signalized his reign by driving out from the stronghold of Fraxinet the Moorish pirates who had seized it in 889, and thence ravaged the neighboring country. His brother Rothbold, who held the fief

until 1008, was followed by his nephew William II., and, as the union of the kingdom of Arles with the German empire was by this time almost nominal, the count of Provence claimed independence, and William's sons, Geoffery-Bertrand I. and William III., divided the county in 1018 as an allodial fief. William III. died in 1053 and Geoffery-Bertrand handed over to his nephews the northern part, or the county of Forcalquier, he himself retaining the main province to which his son Bertrand II. succeeded in 1063. At his death without issue in 1093 the county was ruled by his mother Etiennette, who was followed (1100) by her daughter Gerberge, wife of Gilbert, viscount of Milhaud and Gévaudan. Their daughter Douce was married to Raymond-Bérenger, count of Barcelona, of the house of Aragon, and Provence passed to him in 1112. But his succession was not undisputed. Raymond de S. Gilles, count of Toulouse and Venaissin, a great-grandson of Rothbold, had about 1085 laid claim to the county of Forcalquier, and his pretensions were probably partly admitted. The excitement of the crusades put a stop to further action, and in 1096, accompanied by Count Gilbert, he led the Provençal contingent, which was, however, more distinguished for foraging than fighting. On his death in 1105 his claims were revived by his son Alfonse Jourdain, who succeeded in obtaining from Raymond-Bérenger an extension of the county of Vanaissin. Raymond-Bérenger I. died in 1130 and was succeeded by his son, Bérenger-Raymond, whose rights were disputed by Raymond de Baux, husband of his mother's sister Etiennette. In the war which ensued the count was killed before Melgueil, leaving a young son, Raymond-Bérenger II. (1144), to the guardianship of his uncle, Raymond-Bérenger of Aragon. The claims of Raymond de Baux were renewed by his son Hugo, on whose defeat in 1162 the emperor Frederick I. gave his niece Richilda in marriage to the young count, and invested him with the fiefs of Provence and Forcalquier. His only daughter, Douce, had been betrothed to the count of Toulouse, who accordingly on the death of Raymond-Bérenger II. (1166) claimed the county, but was defeated by Alphonso I. of Aragon, who invested his brother, Raymond-Bérenger III., on whose death in 1181 the fief reverted to Alphonso I. to pass to his son, Alphonso II. (1196). This prince died in 1209, and was succeeded by his son Raymond-Bérenger IV., who, seeing that the great cities were nests of intrigue for rivals to the throne, set himself to destroy their independence. Through all changes of rulers the cities had kept their internal freedom and old Roman self-government. The election of the governing body had always remained in the hands of the citizens, but the office of chief magistrate, after ceasing to be filled by a nominee of the Byzantine emperor, had become vested either in certain families or in the bishops. In the 12th century measures of reform were imitated from the Italian republics, the chief characteristic of which was the election for life of a stranger as chief magistrate or *podestà*. The power of the *podestàs* was too great to be broken at once, and, though the Albigenses in Avignon capitulated in 1226, and Nice, Grasse, Toulon, and Marseilles afterwards submitted to Raymond-Bérenger IV., it was left to his son-in-law, CHARLES OF ANJOU (see vol. v. pp. 366-367) to replace the *podestàs* by governors of his own nomination (1246). Charles died in 1285, leaving the states of Anjou, Provence, and Naples to his son, Charles II., under whose rule peace and prosperity to some extent revived. But the efforts of his son Robert (1309) in the cause of the Guelphs called for increased taxation, and he left a troubled heritage to his granddaughter Joan of Naples (1343). To avenge the murder of his brother Andrew, the husband of Joan, at whose instigation the crime had been committed, Louis of Hungary marched into Italy (1347), and made himself master of the kingdom

of Naples. Joan fled to Provence, and by timely concessions to her people secured their favor in her efforts to regain the Neapolitan crown. But money was needed; so Avignon, where the popes had resided since 1305, was sold to Pope Clement VI., and Joan won back Naples. An important part in the affair was played by the Provençal estates, which consisted of the three houses of clergy, nobility, and commons, and were supreme in all financial matters, however absolute the counts might be in other branches of government. This power of the purse was jealously guarded, and the subsidies granted to the prince were never considered as other than *dons gratuits*, the name by which they were called even after the union with France, when they became an annual tribute. Owing to the right of *répartition* to definite objects of the sums raised by taxation, the Provençaux were not on the whole badly governed, for, though the estates had only the right of petition for legislation, yet when the need arose they could very effectually speak with the voice of the whole people. The representation of the bulk of the nation in the tiers-état was particularly good, for the deputies, who were paid, were returned not only by the twenty-five country electorates, or *vigneries*, but from thirty-seven communes as well. The English constitution may therefore be indebted to Provence for the important step which was taken by the younger Simon de Montfort in first summoning the representatives of cities and boroughs to the parliament of 1265. The earliest recorded session of the estates was in 1146, and the meetings continued at intervals until 1639, when they ceased until 1787. The sessions not being annual, the powers of the estates in ordinary matters were delegated to a general assembly, composed of the archbishop of Aix, the *procureurs joints*, who were representatives of each of the estates of the clergy and the nobility, and the whole of the tiers-état. This assembly gradually superseded the estates until in 1639 it replaced them altogether. To meet sudden emergencies there was a "great council," which consisted of the archbishop and three consuls of Aix as *procureurs du pays*, and the *procureurs joints* of the three estates, under the presidency of the grand *seneschal*. This officer was the representative of the counts in judicial affairs, and during their absence from the country in military matters also. His powers were not only administrative, but to a great extent legislative, and they were therefore fated either to increase at the expense of the sovereign or to be cut down by a firm ruler. Joan chose the latter course, and deprived the grand *seneschal* of his powers over the state domains, and his right to remove judges and pardon capital crimes. And she not only reduced his power but appointed an Italian to the office, upon which the nation rose in revolt, and Louis of Anjou, seizing the opportunity to press his claims to the throne, led an army into Provence in 1368. The pretensions of Louis were met by Joan's offer to adopt him as her heir, and on her death in 1382 he succeeded to the county. The reign of Louis I. was passed in the unsuccessful pursuit of his claims to the kingdom of Naples, and his son, Louis II. (1384) and grandson, Louis III. (1417) continued the same unprofitable contest. René (1434), a brother of Louis III., was not less inclined to give up his rights, which had revived in force from his adoption by Joan II. of Naples, but, though fortune at first smiled on him, he was at last forced to resign his claim in favor of the house of Aragon. The count, or titular king, was an accomplished musician and a lover of literature and the arts; and, the latter part of his reign being on the whole peaceful, he was able to give free play to his inclinations. The artistic fame of his court has lasted to the present day, but it was the interest which he took in his subjects' material welfare, and his administration of wise laws, which caused his people to lament the death of René the Good. He died in 1480, and leaving only a daughter Margaret, the ill-fated wife of Henry VI. of Eng-

land, bequeathed the county to his nephew Charles of Maine. Charles III. died in the following year, making Louis XI. of France his heir, and in 1486 Charles VIII. by letters patent reunited the county to the kingdom of France.

The union was confirmed by the estates with the full approval of the people; but the emperor was not inclined to relinquish without a struggle his claims to overlordship, and he found a willing tool in the constable, Charles of Bourbon, who entered Provence at the head of the imperialist army in 1524. His adventure met with failure, and the invasion by the emperor Charles V. himself in 1536 was equally unsuccessful. In 1501 Louis XIII., with the view of strengthening his own authority, replaced the "conseil eminent," which in the time of the counts had been the highest court of justice, by a "parlement," consisting at first of the grand seneschal, a president, and eleven nominated councillors. The functions of the court were strictly judicial, but before its abolition in 1790 it had often assumed legislative rights, and consequently played a conspicuous part in the civil wars of the 16th and 17th centuries. The principles of the Reformation made what little progress they did in Provence from external rather than internal causes, and the people themselves never took kindly to doctrines which in many ways assumed an extremely bizarre and heretical form. The 13th century had witnessed Simon de Montfort's crusade against the Albigenses of Languedoc, and the ruin which heresy had brought on that province cannot have given the prosperous Provençaux any great love for new doctrines. The Waldenses of the 16th century were therefore chiefly confined to the mountainous districts, but the persecutions ordered by the parlement brought the horrors of civil war on the whole country. The extreme Catholics formed the Holy League against the Protestants, and the two parties were equally at enmity with Henry III., who tried to please both without satisfying either. In time the royalists and Protestants united under the name of *Bigarrats*, but it was not until Henry IV. had come to the throne, and Marseilles, the last stronghold of the League, had submitted, that the worn-out country was again at peace. Richeliéu tried to increase the taxation of the people without their consent, but the disorders of the Cevennes were the result, and a similar attempt by Mazarin in 1647 led to disturbances in connection with the Fronde which lasted until 1652. In 1707, during the War of the Spanish Succession, the army of the allies under Prince Eugene invaded the province, and the horrors of war were followed by those of the plague of 1720, when 100,000 persons perished, Marseilles alone losing 50,000 out of a population of 90,000. The dispute between the Jesuits and Jansenists waxed warm about 1726, but the victory of the former only preceded their suppression by Pope Clement XIV. in 1773 in return for the cession of Avignon and the county of Venaissin, which had twice changed hands since their reunion with Provence in 1663. On the reconvoction of the estates in 1787 the two upper houses refused to bear their share of taxation, and in 1789, in the states-general of the kingdom, Mirabeau with his colleagues renounced the freedom and independence of the province. The division of Provence into departments in 1790 finally obliterated all traces of the ancient constitution, but the people still preserve in the soft tones of their *langue d'oc* an undying reminder of their former independence.

(H. B. B.)

PROVERBS, BOOK OF. The title of the book of Proverbs is "The Proverbs of Solomon" (משלי שלמה, *mishlê shelômah*, or more shortly *mishlê*, for which Origen gives the feminine form, *mislôth*, Euseb., *H. E.*, vi. 25). The title in the LXX. is a literal rendering of the Hebrew, Παροιμίαι Σολομώντος. In early times the book was frequently referred to both among Jews and Christians under the name of "Wisdom" or "The Wisdom that comprises all Virtues"

(ἡ παναρετος σοφία, Clem. Rom., ch. 57). This name, however, was employed somewhat indiscriminately, for not only Proverbs but also Ecclesiastes and the apocryphal books Ecclesiasticus and Wisdom were also designated by it, and sometimes apparently the whole third division of the canon (Lightfoot, *Epp. of S. Clement*, p. 164, sq.).

The book of Proverbs as it now lies before us consists of a number of distinct parts.

1. We have, chap. i. 1-7 (or i. 1-6 as some think), a general heading and preface, giving the title of the book and the purposes to be served by its contents: "The Proverbs of Solomon, the son of David, king of Israel. To know wisdom and instruction . . . to give subtlety to the simple, to the young man knowledge and discretion . . . to understand a proverb and a figure, the words of the wise and their dark sayings." This is followed by the fundamental maxim of the Wisdom, "The fear of the Lord is the beginning of wisdom." The question to what parts of the book this preface extends is not easy to settle.

2. This general preface is followed by a lengthy passage, i. 8-ix. 18, which consists, not of detached proverbs, though a number of such proverbs are scattered through it, but of connected discourses in praise of wisdom and the benefits which she confers on those who embrace her. The speaker is one of the wise, or a type of them, who addresses his youthful pupil or friend as "my son," though at several points wisdom herself is introduced speaking, displaying her graces, offering herself to men, narrating her history, and magnifying the delights which they who follow her enjoy, as well as painting in dark colors the evils from which she preserves them. Attempts have been made to divide the passage into distinct sections, but without much success. Ewald counts three general divisions, Bertheau seven, Hooykaas eleven, and Delitzsch fifteen. The passage is in the main homogeneous, though containing at more places than one elements which at first sight might appear foreign (e.g., vi. 1 sq.), and on the whole at least is the composition of a single author. Several of its characteristics, such as the style, and particularly the personification of wisdom in chap. viii. and elsewhere, one of the most remarkable and beautiful things in Hebrew literature, indicate that the passage belongs to an advanced stage of the Hebrew wisdom.

3. Then follows the largest section in the book, x. 1-xxii. 16, with a new heading, "The Proverbs of Solomon." This division consists of a number of verses—three hundred and seventy-four, it is said—each of which contains a single proverb or maxim in two lines, the only exception being xix. 7, which has three lines, but this is probably due to one member of a second verse having fallen out. The kind of poetical parallelism most common in these verses is the antithetic, of the type "A wise son maketh a glad father, but a foolish son is the heaviness of his mother" (x. 1). This type of parallelism prevails almost exclusively in x.-xv., after which other types are more commonly introduced. The proverbs in this collection are of a very miscellaneous character, and are thrown together without any classification or regard to subject, though occasionally a few verses are found to follow one another having reference to a common topic.

4. After this comes a small collection consisting of two parts which have been put together, xxii. 17-xxiv. 22 and xxiv. 23-34. The author of the first collection informs his son or disciple that what he addresses to him is "words of the wise" (xxii. 17); and the second small code is inscribed "These also are by the wise" (xxiv. 23). The proverbs in this collection sometimes make one verse, sometimes two or three, and even occasionally run out to a short proverbial discourse.

5. Then follows an important collection, xxv.-xxix., with the inscription, "These also are proverbs of

Solomon, which the men of Hezekiah, king of Judah, copied out" (xxv. 1). The expression "copied out" (LXX. *ἐξεργάσαντο*), lit. "transferred" or removed from one place to another, implies that the men of Hezekiah made use of written sources in forming their collection. The notice is of great historical interest. Hezekiah, besides being a wise and reforming king, had probably literary tastes; he has the reputation of having been a poet himself (Isa. xxxviii.); and his "men" were no doubt scholars and scribes about his court, who shared in his tastes and pursuits, and under his direction used their opportunities to rescue from oblivion the precious remains of the most ancient wisdom by transferring them from the small collections in which they lay hidden into a single and authorized code (cf. 2 Kings xviii. 37). It may perhaps be considered some corroboration of the genuine historical character of the inscription that the collection begins with a number of proverbs relating to kings. The maxims in this code, particularly in xxv.-xxvii., approach much nearer to what we should imagine the early popular proverb to have been than many of those in the other large collection; they are simple, usually contain a comparison, and have none of the abstractness which characterizes many of the maxims in x.-xxii. This may be regarded as a guarantee of their great antiquity.

6. Two small pieces then follow, evidently related to one another, xxx. and xxxi. 1-9,—the former with the inscription, "The words of Agur, the son of Jakeh," and the other with the heading, "The words of King Lemuel." The inscriptions to these two pieces are very obscure. In the former the A. V. can hardly be correct. More probably by a different division of words we should read "The words of Agur the son of Jakeh of Massa. The man said, I have wearied myself, O God, I have wearied myself, O God, and am consumed; for I am more brutish than any man," etc. The words are those of one who has striven to comprehend God and found the task above him (Ps. lxxiii. 22). Possibly the above rendering requires a slight correction in the text, already made in the Veneto-Greek version, which renders "Jakeh the Massaite" (Gen. xxv. 14?). Similarly the heading in xxxi. should probably read, "The words of Lemuel king of Massa, wherewith his mother instructed him." It is uncertain whether the names Agur and Lemuel be real or fictitious.

7. Finally the book is closed by an alphabetical poem, xxxi. 10-31, in praise of the virtuous (that is, the active, capable) woman.

The contents of these several sections are very various and not easy to classify. The proverbialists occupy themselves with life in all its aspects. Sometimes they simply catch the expression of men good or bad, or photograph their actions and thoughts; more generally they pass a verdict upon them and exhort or instruct men in regard to them. The proverbs differ from the shrewd or humorous sayings which are so called in profane literature; some of them have a certain flavor of humor, but they are mainly maxims touching practical life on its religious and moral side. Such maxims cannot be regarded as wholly or even in a very large degree the production of an individual mind. A number of them may well be by Solomon, and a greater number may belong to his age, but though the stream of wisdom began to flow in his day, its beginnings were then comparatively small; as the centuries advanced it gathered volume. In the book which now exists we find gathered together the most precious fruits of the wisdom in Israel during many hundred years, and undoubtedly the later centuries were richer, or at all events fuller, in their contributions than the earlier. The tradition, however, which connects Solomon with the direction of mind known as the wisdom cannot reasonably be set aside. The renown for wisdom which this king enjoyed among his own people, and even, though in a distorted and fan-

tastic form, among the other peoples of the East, must have rested on some real foundation. No doubt reputations grow and veneration magnifies its hero sometimes in proportion to the indistinctness of its real knowledge of him; and objects seen in the broad light of day are very insignificant compared with the bulk which they assume when seen between us and the light still lingering on the horizon of a day that has gone down. But, making allowance for the exaggeration of later times, we should leave history and tradition altogether unexplained if we disallowed the claim of Solomon to have exercised a creative influence upon the wisdom in Israel. At the same time it is probable that this influence did not lie in the application of new methods, much less in the creation of a new direction of thought. The supposition that Solomon was the inventor of the proverbial distich or *marshal*, particularly of the antithetical distich, or that he was the first to use this in his sententious sayings on men and life, and thus the father of didactic poetry among the Hebrews, is a mere conjecture. The distich was employed long before his day and sententious maxims regarding life and men long preceded him. Moreover the conjecture is based on the very false assumption that the essence of the wisdom lay in the form of expression rather than in the matter, and that the curt, sharp, antithetical distich was its proper characteristic and belonged to it from the beginning. This assumption, made by Ewald, has been so usually accepted by writers after him that the polished pointed antithesis has been elevated into a criterion of the higher antiquity of those proverbs which possess it. Probably the opposite conclusion would be nearer the truth. The form of these antithetical proverbs betrays art, long use of the literary methods of the wise and an approach to technicality—things not to be expected in an early age. The early *marshal* was probably simple, containing a figure or comparison, as the name implies; some truth of the life of mankind thrown into an image from nature, without anything artificial or technical. Proverbs like "iron sharpeneth iron," or such fine similes as these—"a trampled fountain and a fouled spring is the righteous man who hath given way before the wicked," "a city that is broken down and hath no wall is the man whose spirit is without control" (xxv. 26, 28)—are the kind of proverbs which we should look for in this earliest time. Solomon has a place of renown in the wisdom, not because he imposed any mannerism upon it, but because he threw a vigorous mind into it. He probably formed no class: the word "wise" did not, from being an adjective, become a noun in his days. The nature of his wisdom is best illustrated by the story of the two women with the living and the dead child (1 Kings iii. 16-28). He possessed a keen insight into the operations of human nature; he knew the world and men and life. Most likely also he possessed the power of giving pointed expression to his shrewd and ready judgments; and, as it is said that he spoke of beasts and fishes and trees, he probably had an eye for the analogies between human life and the external world. From his character we should judge that his three thousand proverbs were not all religious; neither were his thousand and one songs all hymns, or some of them would have been preserved to us besides the two more than doubtful poems in the Psalter (Ps. lxxii., cxxvii.). The theme of the wisdom was life, and its aims were practical, and, if the rise of the wisdom be connected with the age of Solomon, that is due to the fact that life in the civil sense began in this age, and its principles could be discovered. Then the tribes were consolidated into one community, the state rose into existence, the channels of commerce were opened, men entered into various and complicated relations with one another, and the principles which rule such relations revealed themselves to the eye that was open to observe them.

It is not quite easy to form definite conceptions of those called the wise in Israel. They were certainly

no hereditary caste like the priests; neither had they any distinct call to a vocation, like the prophets, although in later times at least they were so well recognized that they could be ranked with these two classes as influential in forming men's opinions and guiding their actions (Jer. xviii. 18). They were probably men who might be named elders, not always because of their age, but because of their superior sagacity; men who, having at heart the welfare of the state and particularly the moral soundness of the citizens, sought to gain the ear of the young and inculcate upon them the principles of right conduct. While the priests were the clergy and lawyers in Israel, and the prophets the statesmen, the wise were the moralists and educationists, whose operations touched the individual in all his relations and duties. Their methods were probably simple to begin with, and natural, without anything strictly characteristic; they were moral "reprovers," or ordinary "counsellors," and possibly at first their ethical maxims were general, touching life as a whole. By and by they surveyed life with a keener scrutiny and subjected it to a sharper analysis, bringing their moral principles to bear on its shades and sides and aspects, and applying these principles with greater inwardness so as to strike not merely at external conduct but at the disposition of the mind. And, finally, under the influence of the universalistic ideas of God and providence suggested to the minds of men in Israel by contact with the great empires of the world and observation of their destinies, when the Jewish state became involved in political movements as wide as the known world, the wise were enabled to gather together the manifold fragments into which they had analyzed the moral life of man and the operation of the providence of God and to perceive that they were all but elements in one great divine system embracing all things, both the world of nature and the destinies of men. To this great scheme, which was but God fulfilling himself in many ways, they gave the name of wisdom in the abstract; it was the counterpart of the divine mind, God's fellow and architect in framing the world. This was the divine wisdom; human wisdom consisted both in intellectual comprehension of it and in moral harmony with it, and the first could be reached only through the second; the fear of the Lord is the beginning of wisdom. Illustrations of the wisdom in its earliest form may be seen in the collection xxv.-xxix., and in many proverbs in x.-xxii. (many examples of the period of most subtle analysis in the last-named collection), while the period of synthesis and what comes near to be a science of wisdom is represented in the passage i.-ix. Naturally along with this advance in thought there appeared a corresponding advance in the forms of expression in which the wisdom clothed itself: the wise acquired a method; a particular spirit began to animate their circles; their phraseology showed the impress of a particular mint, and ultimately assumed a form almost technical.

Perhaps some of the things which failed to attract the attention of the wise are more suggestive than those things with which they occupied themselves. Though sacrifice, for example, be once or twice alluded to, no importance is attached to the ritual system; the priest is not once mentioned, and the external exercises of worship appear to have little significance. But, what is more remarkable, the wise man differs as much from the prophet as he does from the lawgiver. All those ideas around which prophecy revolves, such as the idea of the kingdom of God, of a chosen people, of a Messiah or future king of the house of David, and the like, are entirely absent. The distinction between "Israel" and the "nations" has no place. The darling phraseology of the prophets—"Israel," "Jacob," "Zion," "my people," "the latter day"—and the whole terminology of particularism characteristic of prophecy and many even of the Psalms nowhere occurs. The conflict between the worship of Jehovah and that of false gods, with which the pages

of prophetic writers are filled, does not receive even a passing reference. Conclusions have been drawn from these peculiarities which, though not unnatural, are scarcely warranted. It has been inferred that the wise were men whose way of thinking placed them outside of their dispensation and in antagonism to the circle of beliefs cherished in Israel and represented by the prophets and other public teachers—in short, that they took up a humanistic or naturalistic position. A position to which the name naturalistic could be given is inconceivable in Israel. There were no doubt men called wise who pursued false directions (Jer. xviii. 18), as there were false prophets; but there is nothing in the Proverbs to indicate any antagonism between their authors and either priest or prophet. On the contrary the passage iii. 9—a solitary one no doubt—"Honor the Lord with thy substance, and with the first fruits of all thine increase," shows their friendliness to the ritual. If they say on the other hand that the sacrifice of the wicked is an abomination to the Lord (xv. 8), and that by mercy and truth iniquity is atoned for (xvi. 6), this is nothing but what the prophets proclaim in a body, and means merely that obedience is better than sacrifice and the moral higher than the ritual. And even Sirach, a fervent supporter of priesthood and sacrifice (Eccles. vii. 29 *sq.*), enunciates the same doctrine: "He that keepeth the law multiplieth offerings; he that taketh heed to the commandments sacrificeth a peace-offering. To depart from wickedness is a thing pleasing to the Lord, and to depart from unrighteousness is a propitiation" (Eccles. xxxv. 1 *sq.*). And that the wise men feel themselves within the circle of the revealed religion is evident from their use of the name Jehovah, their frequent references to the "law," that is, *torah*, or revelation, the "commandment," the "word," and the like; and such a sentence as this, "Where there is no vision (prophetic revelation, 1 Sam. iii. 1) the people cast off restraint" (xxix. 18), shows no unfriendliness to the prophets. The wise men had no quarrel with the institutions of Israel, nor with the public teachers and their operations; they occupied themselves more, however, with the life of the individual than the community, and sought to distil from the particularistic thought in Israel principles which, both in morals and religion, should be universal and applicable wherever men lived.

Still this very universalism is a remarkable thing, and a different attempt has been made to explain it. It has been suggested that the wisdom, though some beginnings of it may have appeared during the prophetic period and while the autonomy of Israel as a state continued, must be in the main elements of its literature a thing posterior to the downfall of the state and the cessation of prophecy. Only in this way it is thought is it possible to explain the complete absence of all those ideas regarding Israel as a people, its relation to the heathen, and its future destiny, which fill the pages of the earlier literature. That inspiration and exaltation of mind which marked the prophetic age has disappeared and reflection has taken its place. Enthusiasm for the state has died out because the state has perished, and is now represented by care for the individual. Prophecy has fulfilled its mission; it has lodged its principles in men's minds; it has seen itself fulfilled in the overthrow of the kingdom, but the hour of its triumph has been the hour of its death. Now follows the time of reflection upon the prophetic truths, when the mind has accepted principles and risen through prophetic teaching to universal conceptions of God and the world, and an effort is made to apply them to the individual life. In short the age of the wisdom is the period of the return from exile, when Israel was no more a nation but a community of people, when it had no king of its own but obeyed a foreign ruler, and when prophecy speedily became dumb, partly because its mission had been fulfilled and partly because the chief condition of its exercise, the existence of the state, was wanting. In this condition of things the

wise arose and exercised their functions; they do not allude to prophetic conceptions because, so far as these concerned the people in its nationality, they had in the meantime lost their meaning, and so far as they belonged to the general region of religious and ethical truth they had been accepted at least by the better minds among the people, and it is the aim of the wise to persuade every individual in the community to receive them and live by them. The wise indeed are the successors of the prophets; they inculcate the same truths as they did, but the subject whose ear they seek to gain is the individual and no more the state.

Such a theory, should it come to be accepted, would carry its compensations with it. It would fill with the liveliest activity a period in the life of Israel where a silence almost of death seems at present to reign. The centuries after Malachi are a great blank; if we could suppose them filled with the life and thought reflected in the charming literature of the wisdom, they would yield in interest to no period of the nation's history. And beyond doubt the wisdom continued to flourish in this age, for Ecclesiastes and later down the extracanonical wisdom of Sirach are the fruits of it. If we consider Ecclesiastes, however, we find that it is the proper successor to the book of Job; it reflects the natural exhaustion of speculation on the great mysteries of God and providence which could not but follow the stormy conflict exhibited in Job. But in the two great collections of Solomonic proverbs such doubts regarding providence do not at all appear, and even in the other collections (except chap. xxx.) they are touched on lightly. The Proverbs appear to signalize the stage of Hebrew thought anterior to the book of Job. It may be said that Sirach does not debate such questions. This is true, but the reason is that he consciously declines to entertain them, "Seek not things that are too hard for thee;" "None shall say, what is this? wherefore is that?" (Ecclus. iii. 21, xxxix. 16), while to the proverbialists they do not occur. Again, it is doubtful if any period in the history of Israel was marked by an absence of those national aspirations and hopes so prominent in the prophets; and if the wise do not allude to them it is not because the hopes were dead but because another direction of thought absorbed them. They are equally indifferent to the claims of the law. But, at whatever time the Levitical legislation arose or was codified, it is certain that at no period was it observed as it was after the restoration. And yet there is no allusion to it in the Proverbs; the "law" referred to is not the ritual but the ethical law as in the prophets; it is the law of one's mother, of the wise, of divine revelation in general, but never specifically that of the priest. In Sirach on the contrary the wisdom herself is identified with "the law which Moses commanded us for a heritage unto the assemblies of Jacob" (Ecclus. xxiv. 23). The truth is that the wisdom is a direction of thought differing from the main line of thought in Israel at any time, and yet a direction which we should expect and which we desiderate at all times. It is a force which was disrupting the particularism of the Jehovah religion from within just as the events of history shattered it from without, and bringing to view its inherent universalism. The prophets direct their attention mainly to the state, and they appear at irregular intervals. It is when the lion roars that they give the alarm (Amos iii. 8). Their voice is heard only when the tempest is rising, when some crisis in the people's history is approaching. We can hardly doubt that the intervals were filled up by the operations of men who pursued a calmer method, such as the wise, who were the "reprovers" and monitors frequently alluded to by the prophets themselves (Hos. iv. 4; Amos v. 10; Jer. xviii. 18). There is some danger of pushing the principle of development to an extreme so as under the influence of too ideal a conception of progress to divide the history and thought of Israel into sections by drawing straight

lines across it, as Ezekiel in his vision divided the holy land into rectangular belts. No people moves forward on one line or in a mass. Alongside of the main current of thought and progress there are always minor currents running. And finally, while there are many proverbs that from their nature can hardly be placed in the period of the restoration, there are really none that from their internal character require to be dated so low. The proverb already quoted, "Where no vision is the people cast off restraint" (xxix. 18), must be contemporaneous with the prophetic period. The other, "My son, fear the Lord and the king" (xxiv. 21), would scarcely be spoken later than the monarchy (cf. 1 Kings xxi. 10). Many of the references to kings are no doubt general, though they are more natural under the native kingdom than at any other period (e.g., xvi. 12, xx. 8); but such a saying as this, "A divine sentence is on the lips of the king, his mouth shall not transgress in judgment" (chap. xvi. 10), seems to take us back to the more ancient days in Israel when the king actually judged causes in person. And undoubtedly the national tradition at the time of the composition of Job, as we see it reflected in the speeches of that book, was that the moral wisdom was so ancient as to be of immemorial antiquity.

The questions regarding the age of the individual collections contained in the present book and the age of the book as a whole are complicated.

1. It is an unfortunate thing that the headings cannot be absolutely relied on. Such headings are often founded on tradition, or are merely suggestions of later editors or collectors. The heading of the collection xxv.-xxix., "These are also proverbs of Solomon, which the men of Hezekiah copied out," does not of course date from the men of Hezekiah, for the word "also" shows that it is due to the editor who brought the collection into our present book, in which other proverbs of Solomon, viz., x.-xxii., already stood. There is no reason, however, to doubt the historical accuracy of the inscription. This collection is at least as old as the end of the 8th century. At this period the proverbs contained in it were considered and called Solomonic. This of course does not guarantee that every proverb in the collection is by Solomon, though it guarantees the antiquity of the maxims, for the individual proverbs in a collection will always be older than the collection itself, and some of them may be of great antiquity. The term "copied out" implies that the men of Hezekiah confined themselves to written sources. We have little knowledge how the wise conducted their operations. Probably their instructions were in the main given orally. But small collections of their sayings were occasionally made by themselves or by others. Several such collections were in existence in Hezekiah's days, and his scribes gathered them into one book. The usual extent of such small codes may be inferred from some of those embodied in our present book, e.g., xxii. 17-xxiv. 22, xxiv. 23-34, and xxx. There is no probability that the term "copied out" implies that the men of Hezekiah proceeded critically and made a selection from a large mass of proverbs of such as they considered Solomonic, neither can their collection have been a gleaming made from a number of small codes after the large code x.-xxii. had already been extracted from them. They can hardly have been acquainted with x.-xxii., otherwise their code would not have contained so many duplicates of maxims in that collection. It is certainly not improbable that Hezekiah's collection forms the oldest element in our book. Many of the proverbs contained in it have the stamp of antiquity. It comprises almost all the proverbs that we still use. Such sayings, as "iron sharpeneth iron," as "face answereth to face in water," "the dog is returned to his vomit," "bray a fool in a mortar," phrases like "heap coals of fire upon his head," "singing songs to a weary heart," "good news from a far country," "the curse causeless," "a whip for the horse, and a bridle for the ass, and a rod for the fool's back," are examples. Almost all the proverbs in xxv.-xxvii. contain a comparison, and some are of great beauty, as for example, "an earthen vessel glazed with silver dross, so are fervent lips and a bad heart." The youngest elements in this collection are found in xxviii.-xxix., which approach nearer the abstract and analytic manner of many of the proverbs in x.-xxii.

2. The passage i. 8-ix. is in all likelihood by one author, though some of the individual maxims contained in it may have been drawn from foreign sources (comp. vi. 9 sq. with

xxiv. 30 sq.), and does not appear to be of very high antiquity. The general preface extends at least to xxii. 16; but, while its author says, "The proverbs of Solomon, son of David" (i. 1), a new inscription, "The proverbs of Solomon," heads x. This implies that i.-ix. were not considered Solomonic; the proverbs properly so-called commenced with the tenth chapter. Several things point towards a particular age as that to which the passage belongs. (1) The passage is probably prior to the book of Job, for the personification of wisdom seems referred to in that book (xv. and xxviii., though xxviii. may be later than the main portions of the book). The age of Job is no doubt uncertain, but it can hardly be considered anterior to the exile, nor yet much later. (2) The descriptions given of wisdom taking her stand by the broad-ways and at the gates and addressing the thronging crowds of men (i., viii.), as well as the picture of the strange woman prowling in the streets at nightfall (vii.), suggest that the writer had the idea of a large and populous city present to his mind. This could be no other than Jerusalem, and certainly Jerusalem before its destruction. The miserable city of the restoration could not until many generations after the return have afforded materials for the ideal before the author's eye, for nearly a century after the first exiles returned great part of it was still in ruins (Neh. vii. 4). Though the author warns the youth of his day against disorderly and violent men, his references to life suggest a condition of general comfort and plenty. (3) On the other hand the personification of the wisdom marks the highest point to which Hebrew thought on the world rose, and cannot belong to an early age. It is scarcely conceivable except at a time when the operations of the wise had been long pursued. Wisdom, pausing in the work of expounding providence and the laws of human happiness, which she had long instinctively pursued with self-forgetful fascination in her task, becomes self-conscious, and turning her eyes upon herself displays her own graces and beauty before the sight of men. A philosophy of wisdom has now been reached. These facts together point to a time not very long anterior to the destruction of Jerusalem, possibly about a century after the men of Hezekiah made their collection. With this agrees the language of the piece, which, though generally good, has several marks of a somewhat late age, e.g., the frequent formation of abstracts in *-uth*.

3. It is more difficult to form an opinion regarding the large code, x.-xxii. It has generally been considered the oldest collection in our book; and without doubt many of the proverbs contained in it may be old, as old as those in Hezekiah's collection, though others may be of more recent origin. From the nature of such general maxims there is little about them to suggest one age in preference to another. The grounds, however, on which these proverbs have been considered the oldest in the book hardly support such a belief. These grounds are partly the form of the proverbs and partly the nature of their contents compared with the other collections. In form the collection consists exclusively of distichs, and in large parts of antithetical distichs. But, though the distich may be the oldest form of proverb, the inference can hardly be drawn that all distichs are ancient; the distich continued the prevailing type at all times, being still largely used by Sirach, and all that we are entitled to say is that some distichs are older than any proverbs that have another form. But many of the antithetical distichs for which a high antiquity is claimed are probably comparatively modern. Their literary style is too finished and elaborate to possess a high antiquity. There is an abstractness in them, and an artificial balance of member against member and word against word which suggests high literary culture and long use of the arts of the proverbialist. Further the extremely promiscuous nature of the collection, the repetitions in it, and the frequent occurrence of proverbs which are but modifications of others are proofs that it contains elements belonging to very different periods. The conjecture that Solomon himself put forth any collection of his proverbs has little to support it. At all events neither this whole collection nor any part of it in its present shape can have come from the hand of one who was the author of any great number of the proverbs contained in it. Nor can its present confusion be sufficiently explained by supposing with Ewald that an original ancient and orderly collection has suffered mutilation and fallen into disorder through repeated transcription and strong interpolation. That collections of proverbs were particularly liable to interpolation appears from the Septuagint, but the incoherence of our present code is such that it must have characterized it from the beginning. When we find one proverb repeated verbally (xiv. 12 = xvi. 25), a number of others having the first member identical but differing in the second, and again a number more differing in the first member but identical in the second, we are led to infer that many of the proverbs before coming into the collection had a long his-

tory of oral transmission and currency, during which they underwent great changes, that like defaced coins they were thrown into the mint and came forth with a new image and superscription to circulate again among men, and that the code as a whole has been drawn largely from oral sources. While many of the maxims in such a code may be very ancient, the collection as a whole may be pretty late. Judged by contents, there is nothing in it that might not belong to the prophetic age or which would compel us to bring it in its present form below the exile. Some references in this collection, e.g., those to kings, when compared with similar allusions in Hezekiah's code, are thought to reflect an earlier and a happier time. The king is spoken of in a complimentary way, while in Hezekiah's collection the evils of corrupt government are bewailed and the *misera contribuens plebs* comes to the front. But the argument that proverbs in praise of a wise monarch must have originated under wise monarchs and conversely is not particularly strong; if the men of Hezekiah had felt the force of it they would scarcely have set a number of equivocal references to kings at the head of a collection formed under the auspices of that exemplary monarch. The history of the monarchy of Israel, both north and south, was sufficiently chequered to give the people experience of every kind of rule. Solomon himself was not a model prince, and neither in his nor his successor's days were the people unfamiliar with oppressive exactions. The references to rulers in all the collections are general reflections from which historical conclusions can hardly be drawn; in xix. 10 the rise of a slave to rule over princes is spoken of, a thing unknown in Israel; and similar general allusions to rulers occur both in Ecclesiastes and in Sirach (Eccles. vii. 4 sq.).¹

4. There is nothing in the contents of the small collections xxii. 17-xxiv. 34 to suggest a date lower than the exile (cf. xxiv. 21). On the other hand the despair of attaining to the knowledge of God expressed in ch. xxx. reminds us of Job xxviii. and Ecclesiastes, and the passage may belong to the post-exile period. The warning against adding to the words of God (xxx. 6) might also suggest the existence of canonical writings. The section is marked by peculiarities of language and manner. If the names Agur and Lemuel be real the passage might belong to a time when Israel and the tribes towards the south began to coalesce. The alphabetical poem with which the book is closed is probably not early, though there is little in it to suggest any precise age. Ezek. xxvii. 17 compared with xxxi. 16, 24, perhaps shows that in the time of this prophet Judah did not yet engage in the kind of manufactures mentioned in the poem.

The general heading i. 1-7 must be preface to at least i.-xxii. 16; it may extend to xxiv., or to xxix., or to the end of the book. Its relation to i. 8-ix (is of importance in reference to the date of the collection x.-xxii. On the one hand it is probable that the preface comprises ver. 7, "The fear of the Lord is the beginning of wisdom." Some such general aphorism was necessary to clinch the statement regarding the uses of the proverbial literature. On the other hand the passage i. 8-ix. could scarcely have begun abruptly, "My son, etc." The general aphorism both closes the preface and introduces what follows. If this be the case the author of the preface is also author of i. 8-ix., and undoubtedly the preface agrees in style with these chapters. He is certainly also the editor of x.-xxii. It is possible that he was also the collector of the proverbs in this code. In any case this important collection would be anterior to the exile, though it is not likely that the collection was made long before the destruction of Jerusalem. The agreement, however, between the style of the preface and that of the first nine chapters is supposed by others to be due to imitation on the part of the author of the preface. This is possible, though less natural. On such a supposition, however, the preface would be younger in date than i. 8-ix., and the conclusion as to the age of x.-xxi. would fall to the ground. This collection in that case might be later than i.-ix. and contain proverbs of the post-exile period. The preface refers to "the words of the wise," and it is probable that it extends to xxiv. Whether the author of the preface and editor of i.-xxiv. added also xxv.-xxix. is uncertain; the word "also" (xxv. 1) implies that this independent code was added when x.-xxii. had already received a place in the general collection.

The Septuagint version exhibits great variety of reading, and has many additions and also remarkable omissions. The additions are usually of little worth, though with exceptions, as the word "not" in v. 16. Critically the omissions are of more interest than the insertions. This version transfers

¹ The statement of Ewald that the *article* is rarer in this collection than in that of Hezekiah is not supported by the facts: on the other hand the anticipative Aramean suffix, not found in xxv. sq., is common to the two other large codes, i.-ix. and x.-xxii.

xxx. 1-14 to a place after xxiv. 22; then follows the remainder of chap. xxiv. After this comes xxx. 15-xxxi. 9, then the code xxv.-xxix., and finally xxxi. 10-31. The objects of this transposition are not apparent; but the effect of the changes here and elsewhere has been to obliterate all traces of other than Solomonic authorship from the book, and possibly this was intended.

Literature.—Important commentaries are those of Schultens, M. Stuart, Ewald, Hitzig, Delitzsch, Bertheau (*Exeg. Handb.*, 1st ed.; 2d ed. by Nowack). Valuable on the text is Lagarde, *Anmerkungen zur Griech. Uebersetzung der Proverben*; also Deyserinck, *Krit. Scholien* (reprint from *Theol. Tijds.*, 1883.) Works on the Wisdom are—Bruch, *Weisheitslehre der Hebräer*; Hooykaas, *Geschiedenis der Boefening van de Wijsheid onder de Hebrëen*; Oehler, *Grundzüge der Alttest. Weisheit*. The literature is fully given in Lange's *Comm.* and the introductions; see especially the valuable section in Kuenen's *Hist. Krit. Onderzoek*. There is a special treatise on xxx.-xxxi. 9 by Mühlaus. (A. B. D.)

PROVIDENCE, a city of the United States, one of the capitals of the State of Rhode Island (the other being Newport), and the seat of justice of Providence county, is situated in 41° 49' 22" N. lat.

Plan of Providence.

and 71° 24' 48" W. long., at the head of Narragansett Bay, on both banks of Providence River, and with Seekonk River on its eastern boundary. A nearly circular sheet of water known as the Cove lies in the heart of the city at the junction of river and tributaries. The total area of Providence is 14.76 square miles. On the east side the ground rises to a height of 204 feet, and on the west, where there is much more of level surface, to 75 feet; but both the sides and summits of the hills are occupied by dwelling-houses. To the south lies the Roger Williams Park (102 acres) bequeathed to the city in 1871 by Betsy Williams, a descendant of the founder of Providence. The best known of all the public institutions is Brown University, whose spacious buildings (University Hall, Manning Hall, Hope College, Rhode Island Hall, Sayles Memorial Hall, Slater Hall, etc.), crown the heights on the east side of the river. Originally founded at Warren in 1764 as Rhode Island College, it was removed to Providence in 1770, but did not obtain its present name (bestowed in honor of Nicholas Brown, one of its principal benefactors) till 1804. By the terms of its charter 30 out of the 48 members of its board of fellows and board of trustees must be Baptists, but the management is unsectarian. In 1884 there were 20 professors and instructors, and 248 students. The library, kept in a fire-proof building, numbers 62,000

volumes. Besides the university, the city contains two high-schools, the Friends' Yearly-Meeting Boarding-School (1819), the Roman Catholic Academy of the Sacred Heart of Jesus (1873), the Athenæum (1836) with a library of over 43,000 volumes, the Providence Public Library with nearly 32,000 volumes, the Rhode Island Historical Society (1822, present building 1844), the Franklin Society (1823) for the furtherance of the natural sciences and mechanic arts, and many other educational institutions. The Butler Hospital for the insane (1844-47), which takes its name from Cyrus Butler, the principal subscriber, occupies several handsome buildings on the west bank of Seekonk river, capable of accommodating about 200 patients and possessing 140 acres of ground. Dexter Asylum (1827) for the poor, with 39 acres, the bequest of Mr. Ebenezer Knight Dexter, receives about 125 inmates; and the Rhode Island Hospital (1863-68), erected at a cost of \$450,000, has about 80 patients. Other institutions of a benevolent character are a home for aged men, a home for aged women, a Roman Catholic orphan asylum (1860) and dispensaries. The State prison and county jail used to stand on the north side of the Cove; but the State prison, the workhouse, the house of correction, the almshouse, and the State hospital for the insane are now clustered together at the State farm in Cranston, about 3 miles from the city line. The State House, which dates from 1762, is a plain brick building; but the city-hall erected about 1878-79, at a cost of more than \$1,000,000, is one of the finest buildings of its kind in New England. In front of it is a soldiers' and sailors' monument designed by Randolph Rogers and erected (1871) by the State in memory of 1741 citizens who fell in the civil war. Worthy of note also are the county court-house (1877), the Providence opera-house (1871), the Butler Exchange (1872), the arcade (1828), which runs 225 feet between Westminster and Weybosset Street, with a width of 80 feet. Among the principal churches are a new cathedral (1878-85), St. Stephen's Episcopal, the First Baptist, erected 1775, and St. Joseph's and St. Mary's Roman Catholic. At one time Providence carried on a good trade with China and the East Indies; but its shipping interests, though still considerable,¹ are now mainly absorbed by the coasting-trade, and altogether it has become rather a manufacturing than a commercial centre.

In the production of gold jewellery it is one of the leading cities in the United States, and the Gorham silver factory alone employs 560 workmen. Cotton, wool, and iron are all worked up on the most extensive scale into a vast variety of forms—yarn, calico, braids, laces, broad-cloth, worsteds, steam-engines, rifles, sewing machines, boilers, screws, hinges, etc. Among the larger companies are the Providence Tool Company (1500 workmen), the Corliss steam-engine works, the Providence Steam-engine Company, the Allen Fire Department Supply Company, Perry Davis's pain-killer manufactory, etc. Altogether there are about one hundred cotton mills and sixty wool mills. In 1880 the value of the cotton products was \$2,250,273, of the wool products and worsted goods \$7,139,947, and of the iron castings, machinery, etc., \$4,757,401. The growth of the city in population is shown by the following figures:

1708.....1,446	1810.....10,071	1850..... 41,513
1730.....3,916	1820.....11,745	1860..... 50,666
1774.....4,321	1830.....16,836	1870..... 68,904
1800.....7,614	1840.....23,172	1880.....104,857

According to the registrar's returns the total for 1885 may be estimated at 121,000. From 1855 to 1883 in-

¹ The merchandise imported into the district of Providence was valued at \$537,800 in 1884, and the exports at \$25,296; 59 vessels (10,864 tons) entered from foreign ports, and 41 (5012 tons) cleared.

clusive there has been an average of one birth in 36.37 of the population, one person married in 44.21, and one death in 50.89. The value of real estate in 1883 was \$91,642,100; that of personal estate \$30,854,400. The municipal revenue was \$3,417,593, the expenditure \$3,196,382, and the debt \$8,142,223.

Providence was founded and named by Roger Williams, the religious reformer, who having been expelled from Massachusetts in 1636, landed first at What Cheer Rock near the mouth of Seekonk river and settled some time after at the head of Providence river, where he obtained a grant of ground from the Sachem Canonius. The town united with others in applying for and receiving a charter from the Parliamentary Government in 1643-44. It was partially burned in King Philip's war in 1675. In 1788 De Warville describes it as decayed. A southeasterly storm in September, 1815, raised the water in the harbor 12 feet above the usual spring-tide level and did great damage. The city charter dates from 1832. (W. E. F.)

PROVINCE (*provincia*, etymology uncertain) in the Roman sense, may be defined as the department or sphere of duty assigned to one of the higher magistrates (the consuls and prætors).¹ But when, with the spread of the Roman arms, the government of conquered countries grew to be one of the most important duties of the higher magistrates, the term province, from designating the government of a conquered country as one particular duty of a Roman magistrate, came to be used generally as a designation of the country itself. It is to province in the sense of a subject territory lying outside of Italy and governed by Roman magistrates that the following remarks will apply. As distinguished from Italy, the provinces paid tribute to Rome, for, at least from the time of the Gracchi, it was a recognized constitutional principle that the provinces were the estates of the Roman people and were to be managed for its benefit. Under the republic the constitution of a province was drawn up by the victorious Roman general assisted by ten commissioners appointed by the senate from its own body, and the province was henceforth governed on the lines laid down in this constitution or charter (*lex provincie*). For administrative purposes the province was divided into districts, each with its capital, the magistrates and council of which were responsible for the collection of the district taxes. For judicial purposes the province was divided into circuits (*conventus*), and in the chief town of each circuit the governor of the province regularly held assizes.

Cities taken by the sword were destroyed, and their lands were turned into Roman domains and were let out by the censors at Rome to private persons, who undertook to pay a certain proportion of the produce. Royal domains, such as those of Syracuse, Macedonia, Pergamum, Bithynia, and Cyrene, were also confiscated. On the other hand, communities which surrendered without offering an obstinate resistance were usually allowed to retain their personal freedom and private property, and their chief town was left in the enjoyment of its territory and civil rights, but all the lands were subjected to a tax, consisting either of a payment in kind (*vectigal*) or of a fixed sum of money (*tributum, stipendium*), and in some cases a custom-duty (*portorium*) was levied. It is to this latter class of communities (the *civitates vectigales*, or *stipendiariæ*) that the large majority of the provincial states belonged. In a better position were those states whose freedom was guaranteed by Rome on the ground of old alliances or special loyalty. Their freedom was recognized either by a treaty or by a decree of the Roman people or senate. As a decree of the people or senate could at any time be recalled, the position of the free states without a treaty was more precarious than that of the treaty states (*civitates federatæ*). The latter, though not allowed to meddle in foreign politics, enjoyed a

certain amount of internal freedom, retained their lands, paid no taxes, and were bound to render those services only which were expressly stipulated for in the original treaty, such as furnishing ships and troops, supplying corn at a certain price, and receiving Roman officials and soldiers *en route*. Amongst these treaty states were Massilia (Marseilles), Athens, Rhodes, and Tyre. The privileges of the free but not treaty states were somewhat similar, but, as stated, more precarious. All political distinctions, save that between slave and freeman, disappeared when Caracalla bestowed the Roman franchise on the whole empire.

Provincial Diets.—Apart from the government by Roman officials, every province appears to have had, at least under the empire, a provincial assembly or diet of its own (*conclitum* or *commune*), and these diets are interesting as the first attempts at representative assemblies. The diet met annually, and was composed of deputies (*legati*) from the provincial districts. It arranged for the celebration of religious rites and games, especially (under the empire) for the worship of the emperor, the neglect of which was severely punished. The actual celebration was under the conduct of the high priest of the province, a person of much dignity and importance, perhaps the forerunner of the Christian bishop. The diet also decreed the erection of statues and monuments; it passed votes of thanks to the outgoing governor, or forwarded complaints against him to Rome; and it had the right of sending embassies direct to the senate or the emperor.

The Provincial Governor.—The provinces were administered by governors sent direct from Rome, who held office for a year. From the formation of the first provinces in 227 B. C. down to the time of Sulla (82 B. C.) the governors were prætors (see PRÆTOR); from the time of Sulla to that of Augustus the prætors remained in Rome during their year of office, and at the end of it assumed the government of a province with the title of proprætor. This applies, however, only to provinces which were in a settled state and could consequently be administered without a large military force. A province which was the seat of war, or was at least in a disturbed state, was committed to the care either of one of the consuls for the year or of a commander specially appointed for the purpose with the title of proconsul, who might be one of the consuls of the preceding or of a previous year, or else a former prætor, or even, in rare cases, a private individual who had held neither consulship nor prætorship. Thus the distinction between consular (or proconsular) and prætorial (or proprætorial) provinces varied from year to year with the military exigencies of different parts of the empire. At the close of the republic, however, we find even such a peaceful province as Asia administered by a proconsul. In the earlier period of the republic the senate either before or after the elections determined which provinces were to be governed by consuls and which by prætors, and after their election the consuls arranged between themselves by lot or otherwise which of the provinces nominated by the senate each should have, and similarly with the prætors. But in order to guard against partiality the Semonian law of 123 B. C. provided that the senate should yearly nominate the two consular provinces before the election of the consuls, and that the consuls should after their election but before their entry on office arrange between themselves which of the two provinces each should have. The Pompeian law of 53 B. C. enacted that no one should hold the governorship of a province till at least five years after his consulship or prætorship. This law was repealed by Cæsar after the battle of Pharsalia, but was re-enacted under Augustus; it severed the connection which had previously existed between an urban magistracy and the governorship of a province, and turned the latter, from the mere prolongation of a Roman magistracy, into an independent office. Like magistracies at Rome a provincial governorship was regularly held for one year; but unlike them, it could be prolonged, formerly by a vote of the people, later by a decree of the senate. The Julian law of Cæsar (46 B. C.) enacted that the governorship of a consular province should be held for two, that of a prætorial province for one year. The necessary supplies of men and money were voted to the governor by the senate. His staff consisted of one or more lieutenants (*legati*), a quæstor, and numerous subordinates. The lieutenants were nominated by the senate from men of senatorial rank; if they proved incompetent, the governor dismissed them; if they showed ability, he entrusted them

¹ Only those magistrates who had *imperium* (military power) had a province. When the province of a quæstor is mentioned it refers to the province of the consul or prætor to whom the quæstor is subordinate. In familiar language any business was called a province.

with military or judicial functions. As to the *quæstor*, see *QUÆSTOR*. Besides these the governor took with him from Rome a number of young men of the upper classes to assist him in the government. These were known as the companions (*comites*) or suite of the governor, sometimes, but incorrectly, as the prætorian cohort (see *PRÆTORIANS*). These members of his suite were chosen by the governor himself, who was responsible for them, but they were maintained at the expense of the state, and under the empire received regular pay. In addition there was a crowd of headles, clerks, couriers, criers, doctors, dragomans, etc., not to speak of freedmen and slaves for the personal service of the governor. Under the republic the governor was not allowed to take his wife with him to his province; under the empire he might do so, but he was answerable for her conduct. Before setting out for his province the governor, clad in the purple, military robe of his office, offered sacrifice on the Capitol; then immediately after receiving the *imperium* or military command he marched out of the city (for the *imperium* could only be exercised outside of Rome and was forfeited by staying in the city), preceded by his sergeants (*victores*), and accompanied by his suite. He was bound to travel direct to his province; the means of transport were supplied partly by the state, partly by the provinces through which he travelled. His year of office began from the day he set foot in his province, but the time of arrival varied with the length and difficulty of the route. In the hands of the governor all powers military and civil were united. He commanded all the troops in the province, and had power to raise levies of Roman citizens as well as of provincials, and to make requisitions of war material. He possessed both criminal and civil jurisdiction; as criminal judge he had the power of life and death, and from his sentence none but Roman citizens could appeal; as civil judge he was guided partly by the charter of the province (*lex provincie*), partly by the edict which it was customary for him to issue before his entrance on office (compare *PRÆTOR*), partly by the original laws of the country so far as their validity was acknowledged by the charter or by the governor's own edict. Under the empire Gaius wrote a commentary on the provincial edict, and it is usually supposed that this was a general edict drawn up for use in all the provinces and superseding all separate edicts for the different provinces. Mommsen, however, is of opinion that Gaius only commented on the edict of a particular province.

Condition of the Provinces under the Republic.—Under the republic the Roman people regarded the provinces as so many estates from which they were to derive revenue. The weal or woe of the provincials was of no moment, but the development of the material resources of the provinces was of great moment. Hence agriculture and commerce were encouraged, settlements were made, roads and aqueducts were constructed; in short, the Roman aimed at exploiting his empire by a system of prudent economy as far as possible removed from the blind rapacity which has turned the empire of the Turk from a garden into a wilderness. But the Roman governors were too apt to look on their provinces as their own peculiar prey; they had usually bought their way to office at vast expense, and they now sought in the provinces the means of reimbursing themselves for the expenditure they had incurred at Rome. The annual change of governor was thus a frightful calamity to the provincials, for every year brought a repetition of the same extravagant demands to be met by the same or, as the province became exhausted, still heavier sacrifices. Redress was to be had originally by a complaint to the senate; after 149 B.C. there was a regular court established at Rome for the trial of cases of oppression (*repetundæ*) by provincial governors. But, even when after much trouble and expense the provincials had arraigned their oppressor, it was difficult to secure his condemnation at the hands of juries composed (as they usually were) of men who had a fellow-feeling for the offender because they had themselves committed or hoped for means of committing similar offences. Besides the governor, two classes of harpies joined in wringing the uttermost farthing from the unhappy provincials. These were the publicans or farmers of the taxes, and the money-lenders (*negotiatores*), who supplied a temporary accommodation at ruinous rates of interest. Both these classes were recruited from the ranks of the Roman knights, and, since from the legislation of Caius Gracchus (122 B.C.) the juries were drawn at first exclusively and after Sulla's time (81 B.C.) partially from the knightly order, the provincial governor could not check the excesses of those bloodsuckers without risking a condemnation at the hands of their brethren. Accordingly he generally made common cause with them, backing their exactions when needful by military force.

The Provinces under the Empire.—Under the empire the provinces fared much better. The monarchy tended to obliterate the distinction between Romans and provincials by reducing both to a common level of subjection to the emperor, who meted out equal justice to all his subjects. The first centuries of our era were probably for some of the countries included in the Roman empire the happiest in their history; Gibbon indeed fixed on the period from the death of Domitian to the accession of Commodus (96–180 A.D.) as the happiest age of the world.

Augustus, in 27 B.C., divided the provinces into imperial and senatorial. Those which, from their proximity to the frontier or the turbulence of their population, required the presence of an army were placed under the direct control of the emperor; those which needed no troops were left to be administered by the senate. (1) The senatorial provinces were ruled by an annual governor as under the republic. Of these provinces Augustus ordained that Africa and Asia should be consular, the rest prætorian; but all the governors of the senatorial provinces were now called proconsuls. Their powers and dignities were much the same as they had been under the republic, except that they had now no troops, or only a handful to maintain order. (2) The imperial provinces were governed by imperial lieutenants (*legati Cæsaris*), who were nominated by the emperor and held office at his pleasure; all of them had the power of the sword (*jus gladii*). For the administration of the finances these lieutenants had procurators under them, while the governors of the senatorial provinces continued to have *quæstors* as under the republic. Another class of imperial provinces consisted of those which from the physical nature of the country (as the Alpine districts) or the backward state of civilization (as Mauretania and Thrace) or the stubborn character of the people (as Judæa and Egypt) were not adapted to receive a regular provincial constitution. These were regarded as domains of the emperor, and were managed by a procurator (in the case of Egypt by a præfect, see *PRÆFECT*) nominated by and responsible to the emperor.

Under the empire all provincial governors received a fixed salary. Complaints against them were brought before the senate, and the accusers were allowed a senator to act as their advocate. The lengthened periods during which the governors, at least in the imperial provinces, held office, together with the oversight exercised by the emperor, alleviated materially the position of the provincials under the empire. In order to keep himself well informed of what was passing in the empire, Augustus established a post whereby official dispatches were forwarded by couriers and official persons were conveyed by coaches. The post, however, was only for the use of the Government; no private person was allowed, unless by an exceptional concession, to avail himself of it. (J. G. FR.)

PROVINS, a town of France, at the head of an arrondissement of the department of Siene-et-Marne, at the junction of the Durtain with the Voulzie (an affluent of the Seine), 59 miles southeast of Paris by a branch railway which rejoins the main line from Paris to Belfort at Longueville (4 miles from Provins). While the town derives a certain reputation from its mineral waters (which contain iron, lime, and carbonic acid, and are used for bathing and drinking), and is also known from its trade in roses (incorrectly called Provence roses) for certain minor industries, (such as the making of "conserves" and coloring bonbons), a far higher interest attaches to it as a place which during the Middle Ages enjoyed great prosperity and still preserves, in proof of its former importance, a number of historical monuments. There still remains a great part of the 13th-century line of fortifications, which makes a circuit of about 4 miles, encloses an area of about 300 acres, is strengthened at intervals by towers, generally round, and now, being bordered with fine trees, forms the principal promenade of the town. The large tower, situated within this line and variously known as the king's, Cæsar's, or the prisoner's tower, is one of the most curious of the 12th-century keeps now extant. The base is surrounded by a thick mound of masonry added by the English in the 15th century when they were masters of the town. The tower serves as steeple to the church of St. Quiriace, which, dating its foundation from the 12th century, presents some exquisite features and preserves among its treasures the pontifical ornaments of St. Edmund of Canterbury. The palace of the counts of Cham-

pagne, some fragments of which also belong to the 12th century, is occupied by the communal college. The old tithe-barn is a strange erection of the 13th century with noteworthy fireplaces, windows, and vaulting. Various portions of the church of St. Ayoul date from the 11th, 13th, 14th, and 16th centuries respectively; but it is in a state of great dilapidation, and part of it is used as a fodder-store. Ste. Croix belongs partially to the 13th century. On Mont Ste. Catherine opposite Provins the general hospital occupies the site of an old convent of St. Clare, of which there remains a cloister of the 13th century. The population of the town in 1881 was 6949.

Provins begins to figure in history in the 9th century. Passing from the counts of Vermandois to the counts of Champagne it rapidly attained a high degree of prosperity.

Its fairs, attended by traders from all parts of Europe, were of as much account as those of Beaucaire. They were held twice a year, in spring and autumn, and fixed the price of provisions for the intervening months. In the 13th century the population of the town is said to have reached 60,000; but the plague of 1348 and the famine of 1349 proved exceedingly disastrous. The War of the Hundred Years, during which Provins was captured and recaptured, completed the ruin of the unfortunate town. During the religious wars it sided with the Catholic party and the League, and Henry IV. obtained possession of it in 1592 only after thirteen days' siege.
